estimates given, are very small. Apples or pears, I think, however, will practically all of them go eastward. Our prune market will go east. That would also be true as to cherries and strawberries. The market for our canned fruits and vegetables is pretty generally throughout eastern sections. I believe, although we do get some trade in the Orient for them. I would say that the production of canned fruits and vegetables has not increased materially during the past few years in our section. (1623.) The tendency during the past few years in the small fruit and vegetables that we have, there has been very little attention turned to the canning of vegetables in our section, but the tendency the past few years in the small fruits, the cherries and berry fruits, is to ship that fruit eastward green, or what they call the barreled processing. They ship most of our strawberries, which is the largest acreage of tonnage in small fruits, in barrels, put down in a process of sugar, raw.

In the shipment of our barreled and fresh fruits and vegetables I would say expeditious movement is of importance. However, in our location we are almost as close to Portland, which is the beginning of the eastern destination, as we would be to Eugene. It doesn't make so much difference, but expeditious movement of all those products, of course, is advantageous.

891 Cross-examination:

I would say there wasn't very much difference in the mileage whether you go through the Portland gateway or through Crescent over the proposed line.

In the first tabulation of my Exhibit 25 I have 349 cars of various products which are now available for (1624) the cross-State railroad. There were that many cars of those products moved out last year. They were shipped out by rail. We have no check on the auto truck movements that go out. I checked with the different shippers. It all did not move out Southern Pacific, the Oregon Electric carries quite a bit of the canned stuff. The bulk of it, however, goes Southern Pacific. The Great Northern and Northern Pacific, who are owners of the Oregon Electric, are close competitors of the Southern Pacific in our county. I wouldn't say that they get a good percentage of the carload traffic. On the lumber shipments they tell me they do practically (1625) no business on eastern shipments of lumber. There is no mill on their line. The tabulated amount of eastbound lumber shipments that I got was all secured from the Southern Pacific. There isn't any lumber in that first tabulation that you talk about. I imagine they get their share of that. What they get comes down through the Portland gateway and goes north over their lines, to the destination, wherever it may be, in the East.

As to whether some of that 349 cars move to Portland over the Oregon Electric or Southern Pacific and then are transferred to boats, I couldn't say.

Q. It may be purely a local haul from Albany to Portland?

A. No, in checking up with these different shippers I tried to emphasize the fact that we simply wanted data on the eastbound shipments by rail.

892 I doubt that any of these cars that were hauled out of there by the Great Northern or Northern Pacific through their (1626) Oregon Electric are ever going to be available for the cross-State line, but I would say there is a chance that some of them would move by the cross-State road. As I say, we are geographically situated about midway between Portland and Eugene, and I imagine there would be about as good a chance of their going one way as the other. I do not think those industries located on the tracks of the (1627) Oregon Electric are going to route their products over any line except the Great Northern and Northern Pacific if they can help it. I am comparatively ignorant on traffic matters, but it would seem to me as though they (the railroads) would try to hang onto all the eastbound tonnage that they could. It is a matter of dollars and cents with them, is it not? Most of the tonnage is products of agriculture. I presume they are available to any railroad that would give the best service and the best rate. I do not think they are commodities that by reason of the location of an industry on the tracks of a railroad (1628) can be reasonably expected to move by that railroad.

Q. (By Mr. DEY.) Your lumber, present lumber tonnage available from Albany and Mill City, 8,640 cars, what was that? Lumber?

A. Lumber, all of it. It did not include slab fuel and hogged fuel, and other things for local haul unless the Southern Pacific freight agents gave me the wrong steer on the matter. That was eastbound lumber shipments. I got that at Albany and just an estimate of the Mill City tonnage.

893 Q. Well, now, what mills are involved in those 8,000 cars?

A. Well, as I stated previously, the Hammond Lumber Company mill at Mill City, the score or more of small-capacity mills situated in the foothills of Linn County, and they drew somewhat from the territory west of Corvallis, but not over the slope into Toledo. None of those moved over the Oregon Electric. These agricultural products load at (1629) Albany and Lebanon. Those, I think, are the only two points. Now, on some of the grain or seed shipments, it might have come from Harrisburg or Halsey, small towns in the southern part of the county on the Southern Pacific. There are about four or five principal shipping points in the county. I don't know how much of that went beyond Portland.

Q. You don't know that the port of Portland ships out of here by water more of these first two items of seed than the railroads handle out of western Oregon to the East?

A. I think I will have to qualify my answer there again, Mr. Dey. I emphasized the matter in consulting with these shippers, getting their estimate of the tonnage that they had shipped out,

that these were all eastbound rail shipments. Some of them might have been headed into Portland and then loaded from their onto boats, but then it was my understanding that they were not. The ones that went other than East by rail I wasn't interested in. I got information I asked for from the Oregon Electric agent. (1630.) All of those 25 cars of eggs moved by the Oregon Electric.

Redirect examination:

The Albany Chamber of Commerce is an intervener in this case. I am appearing under that intervention.

894 Further cross-examination:

On my statement I say "potential agricultural tonnage, 84 cars." By potential tonnage, what I meant to convey was an increase that might be expected over the next five-year period. The natural development of our agriculture would make an increase. I think we have had such development in the last five years. (1631.) As to whether it is reflected in the earnings of the Oregon Electric, I am not familiar with their earnings. I am secretary of the chamber of commerce at Albany. It hasn't been my business to look into the private affairs of the Oregon Electric or any other railroad.

I have doubled the lumber tonnage in five years. That is an estimate entirely, of course, but I believe we have sufficient grounds for estimating that increase. That is because of new construction that the Oregon Electric is making down into that country.

Q. Well, are you going to have those people build down there into this country and develop that tonnage and then turn it over to a competing railroad?

A. We are not turning any tonnage over to any railroad, as far as that is concerned. (1632.)

Q. You are talking about this as being available for the proposed cross-State railroad.

A. Available for eastern shipments, if you will notice the heading of my exhibit. That lumber tonnage would have a relation to the proposed cross-State railroad if the Hill interests entered into the particular section that we are most interested in building. That is a section from Albany to a connection with their lines at Bend.

Q. You think if they went up to Bend they would turn it
895 over to the cross-State line if the cross-State line was built by the Union Pacific?

A. That is rather questionable. I don't know whether they have any through joint rates with the Union Pacific or not. (1633.)

Q. Where are these strawberries frozen? You way there, "Frozen, 87 cars."

A. We have three processing plants in the county, one at Albany, one at Lacomb, in the strawberry district, one at Lebanon. The berries are shipped by rail, I presume by express. (1634.)

HAL D. PATTON was thereupon produced as a witness on behalf of complainants, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Salem, in Marion County, representing the Salem Chamber of Commerce, and as a tax payer. I have been in business in Salem 42 years. During that time I have been actively connected with various civic enterprises. I have been directed to appear here on behalf of the Salem Chamber of Commerce to testify in this case.

I have prepared information showing the annual shipments of freight that might be benefited by the construction of the cross-State line, and with your permission I would like to read it (1635) into the record at this time. It isn't prepared in exhibit form.

An estimate of annual shipments of freight that would be benefited by a cross-State railroad:

Lumber, from Marion County and Dallas—that is right
896 across the river in Polk County—13,000 cars annually.

Farm products, now this was handed to me by one of our leading merchants in Salem, D. A. White & Company, who shipped a great deal of seed, 300 to 500 tons of rye grass, annually, shipment to Central States; 500 to 600 tons of clover seed; 100 to 200 tons of vetch seed.

Wheat: Soft wheat is shipped to the East.

Gile & Company and Paulus & Company, the big shippers of canned goods, report as follows:

From 300 to 400 cars of canned fruits, berries, and vegetables are shipped from Salem annually to eastern Central States, and would be benefited by a shorter route.

Fresh cherries: Those are by express. In 1927, express (1636) shipments of fresh cherries to the East amounted to 103 cars from Salem. It wasn't so good in 1928, owing to the crop failure.

From the Lake Labish meadows alone, that is just about five miles below Salem, they shipped out last year 550 cars of onions, valued at $450.00 a car; that is the annual estimates, $450.00 a car.

Celery, which is perishable and which would be by the shorter route reaching the Central States much sooner, and be sooner by this central route, we have 500 cars, coming from that land down there, valued at $500.00 a car.

40 cars of lettuce, valued at $700.00 a car.

Within a few years, these shipments will be doubled. That was a statement I secured from Ronald Jones, who is the secretary of the Celery Growers' Union and is absolutely correct. They are not padded.

Now, the eggs: Marion County produces about a million
897 dollars worth of eggs. This is based on the 1924 report of the United States Department of Agriculture, giving Marion County a $624,000.00 on its annual egg production.

The fruit acreage: Within a radius of 25 miles there are in the Salem district 34,000 acres of bearing fruits, berries, and nuts.

Annual pack: In Salem alone the annual pack of fruits, berries, and nuts was 1,086,000 cases in 1926, and in 1927 the (1637) estimate was 822,000 cases, and this pack will be increased over the 1927 pack for this year. More than 1,000,000 cases of fruits, berries, and vegetables are packed annually in the Salem district.

The population of Salem—in 1920, Salem, Oregon, had a population of 17,679. In 1928 a conservative estimate is 26,500.

Portland and Salem tonnage: In 1928 the Salem Chamber of Commerce made for the War Department a survey of tonnage during 1927 between the two cities. The total was about 200,000 tons. Part of this freight would be benefited by a shorter route to the east.

You have the present tonnage there. Additional tonnage available within the next five years—a pessimist would give it about 20 per cent, an ordinary optimist would make it about 100 per cent, but some of the big optimists up our way that believe our country is going ahead would make it 300 per cent increase.

Now, the lumber mills adjacent to our city, that ship out these 13,000 cars annually, which I think is a small estimate of it—
898 I would make it more—probably the railroad officials have a better check on it than I have—the Cobb-Mitchell Lumber Company; the Willamette Valley Lumber Company, the Spaulding Logging Company of Salem, and the Spaulding Logging Company of Newberg, the Silverton Lumber (1638) Company, and the Hammond Lumber Company, and 10 or 15 other smaller mills.

We people up at Salem are directly interested in a more direct outlet to the east. We feel that the development of our country would go ahead much better if there was a cross-country railroad. In regard to competing lines and the Oregon Electric Railroad which I heard the question asked a minute ago, I will state this, competition along is what causes the condition at the present time. A successful railroad, such as the Oregon Electric should be, can be made a success by giving better service and meeting competition. Being a merchant of our city, I don't like to ship by truck, but the fact of a charge of 50 cents for hauling, for instance, from the depot to our store, which is taken care of by the truck shipments—and I find most of the merchants, while not approving of shipping by truck, on account of buying their merchandise, putting their merchandise upon their shelves at a proper price, must lay their goods down in their store equal to their competitors, and I would say this, if there are any Oregon Electric people present, that, coming from a merchant, I believe they could more than double their income by giving better service than giving different rates. That is absolutely foreign to the subject in mind, but I just want to say this for the benefit of any Oregon Electric people (1639) that should be here.

899 Cross-examination:

I have been a merchant in Marion County for 42 years. I was in the legislature. (1640.) I believe our county has grown and prospered perhaps more than any county in western Oregon in the last 10 years. I believe we have a greater variety and a larger pack of products and fruit and that sort of thing, than any of the western Oregon counties. At the present time I suppose our canned fruits and vegetables are shipped through the Portland district. As to by what route they reach them, I would suppose they would come there by express, or freight shipments, or over the Southern Pacific. I am not informed of that. I am not informed as to whether practically all canned goods go in by truck. I know what their shipments amount to, what I have here.

Q. And they go by water, largely, from the port in Portland, (1641) do they not, canned goods, the same as from Eugene and Roseburg?

A. Well, I don't know. I couldn't tell you just how they are shipped. That is up to the shipping agents. Traveling freight agents, I suppose, route them. They call on us at our store. We ship a great deal over one route, and sometimes we will change on account of the personality of the general freight agent. I believe we have had shipments over the O. W. R. & N. I believe we have had shipments from the east over the Union Pacific and Oregon Short Line into Salem, and over this other way. That is in connection with the Southern Pacific. They all get a piece of it.

Q. Now the bulk of your shipments, however, go Southern Pacific and are turned over to the Union Pacific, at Ogden, and that is the long route you object to, is that right?

900 A. We get a great many of our shipments in our business by Merchants Express. I don't know what line that comes over. We have only a little small business. (1642.) All I do is pay the freight bills when they come in. I sell stationery and books.

As to whether agricultural products as a rule go through the Roseville gateway and Ogden and east, I haven't taken that matter up.

The cross-State line would benefit the fruit grower, and to get into the market, as you know, if they could get their cherries, celery, lettuce, into the Central States a day earlier, there is no question it would benefit them; if they could get any of their products back east a day earlier and could get their money back that much sooner, I believe it would benefit them. (1643.)

Q. I think the mileage is in evidence here, and the mileage to Ontario, which is a common point, is four miles shorter via Portland than it is via Crescent Lake. Assuming it is the same, a cross-State line wouldn't benefit you at all, would it?

A. Not me personally, but it would benefit the people in the central part of the State. Do you mean to tell me that it is a

longer distance to ship from Marion County down here, down to Portland, and up there, with all those curves, than it is straight across, clear over there on the map? It seems to me it would be much shorter, and I have been informed that it would save 24 hours. Of course, the passenger trains could make it a little quicker, probably.

As to whether all those commodities, those perishables, move in refrigerator cars, your general passenger agents could inform you better than I could. (1644.)

901 PORTLAND, OREGON, *August 11, 1928.*

J. E. SHELTON was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I live at Eugene, in Lane County. I am engaged in the printing and publishing business at the present time. I have lived in Lane County about 16 years. I am president this year of the Eugene Chamber of Commerce. In appearing here and testifying I represent the Eugene Chamber of Commerce, the county (1646) court, and the Springfield Chamber of Commerce. Springfield is three miles east of Eugene. Eugene has a population of about 26,000. I judge Springfield has a population of about 3,500.

The principal resources of Lane County *of Lane County* are timber, fruit, dairying, and some manufacturing. There is something like 65 billion feet of timber in Lane County. There are several large sawmills in Lane County at the present time, one at Springfield, and Wendling and Westfir, and smaller mills scattered around. In Eugene there is the Eugene Fruit Growers' Association. (1647.) Its business is something better than a million dollars a year. There is a flouring mill that produces all kinds of flour and feed and food products. I am pretty sure it produces cereals. The Oregon Cooperative Egg Producers' Association have a station at Eugene that gathers eggs from over that section of the country that could be reached. The eggs are shipped in there, and the association disposed of them at the location where they can get the highest net market price. The egg cooperative consolidate shipments that come into Eugene for reshipment. (1648.) That association ships eggs in carloads. The contract originally called for the shipment of two carloads a week. I don't know whether they are shipping more than that at this time or not. Swift & Company have a poultry

902 and egg station at Eugene, where poultry is butchered and shipped in large quantities. That poultry station ships in carloads. The manager told me that they were shipping to Chicago. In Eugene we have packing plants, and at the present time there is no wholesale meat distributing plant. One is contemplated, and the deal is being made now for the location there of a wholesale meat distributing station. Eugene has two modern slaughterhouses.

(1649.) There is quite a good deal of distributing out of Eugene in various directions in less than carloads at the present time. That has been true in the past. Eugene is pretty well situated geographically as a distributing center to serve surrounding territory, because it is the center of a territory that is easily reached by railroads and highways, with the exception of to the East. The road to the West is what is known as the Coos Bay road. It is my impression that Eugene distributes in communities over that line reaching from Eugene to Coos Bay. Eugene has rail communication to the north and south of it. (1650.) Eugene distributes in the territory particularly south, and not much farther, as a rule, than Albany on the north, Albany and Corvallis. I am personally interested in the request of the public service commission for an order requiring the construction of a line of railroad across central Oregon from Crane to Crescent Lake on the Southern Pacific. I have been personally interested in getting a cross-State line built across the central part of the State of Oregon from east to west and have been working to obtain that result for 12 or 14 years.

There is a concrete pipe works at Eugene that are making concrete pipe. They have rather a wide distribution, too. That company has recently, during the past year, used diadomite in its manufacturing products. I was informed (1651) by the manager
903 that they had ordered it by the carload lot from Harper. Harper is over in the extreme eastern portion of the State. That diadomite was shipped from Harper over the Union Pacific to Portland or from Harper to Portland by way of the Union Pacific, and south to Eugene over the Southern Pacific. The University of Oregon is located at Eugene. It has a little better than 3,000 students enrolled this year.

As to the sentiment of the people of Eugene and of Springfield and of Lane County generally upon the subject of the proposed cross-State line advocated in this proceeding by the public service commission of Oregon—other than the employees and retainers of the Southern Pacific I don't know of anyone that is openly opposing the public service commission's request. There may be a few that don't understand or are apathetic, but the majority of them, I would say 90 per cent of (1652) them, are in favor of this extension.

Q. On what considerations is that approval of the Oregon commission's request for the construction of this line based?

A. Because it would develop a new territory and enlarge the possibilities of Eugene of becoming a distributing center, and it would develop not only the eastern section of the State but the entire Willamette Valley, give us an outlet for the products that we have direct into a new territory with a shorter haul than we have at the present time, and it would let in necessities at a price that would help develop the territory that surrounds Eugene. I would say that practically all the sentiment to build a cross-State line was based on

the idea of fostering the general development of the State of Oregon.

904 As to what particular products I had in mind of Lane County as to which the building of the new line across the (1653) State would or might afford new markets, particularly in the larger quantities, would be lumber, and fruit, and vegetables, and dairy products, and also the wholesale groceries and the products of the Fruit Growers' Association, their meat-packing plants.

The people of Eugene and Lane County feel that the construction of this proposed cross-State line would be desirable to a very large per cent. They have curtailed the business of the wholesale houses that we have had in Eugene because of the fact that there is no way to get into that country except by automobile, and during the wintertime the McKenzie Pass is closed so that there is no opportunity to guarantee delivery of goods. McKenzie Pass, where is the only road, highway, we have across, the only connection we have now with it, except on the (1654) Southern-Central Pacific line running to Klamath Falls. The territory that we would like to reach is not available. An illustration of that is the wholesale drug house that I am familiar with having lost an order for $10,000 worth of goods simply because they couldn't guarantee the delivery on that at a certain date, for the simple reason that the snow on the Pass wouldn't permit it at that time, so they couldn't get the business. Later they moved to Portland, in order that they could get rail communication that wouldn't cost them so much. (1655.) This $10,000 worth of drugs was to be delivered at Bend. The Drug Company was the Oregon Drug Company. The filling of that order would have been possible had there been this line of railroad constructed east from Crescent Lake that the Oregon commission is not advocating. That is one illustration of the

905 feeling of the business men, and wholesalers, and distributors of Eugene that leads them to the conclusion favoring the construction of the cross-State line. Then a larger development on the west side of the mountains of products that could be delivered, particularly of hay that is there for dairying, would be reached and shipped into Eugene at any price reasonable to be paid for dairy-cattle feed. I should not say that it is practicable to bring hay from east of the Cascade Mountains to Lane County by truck transportation across the McKenzie Pass. There is sentiment in Eugene, and Springfield, and in Lane County for the establishment of closer trade relations (1656) with central and eastern Oregon by means of rail communication. That sentiment has been in existence for the last 15 years that I am personally acquainted with.

The students at the university come from all over the State. Quite a few of them are from central and eastern Oregon. The construction of this cross-State line, in my judgment, would be of benefit in facilitating communication and travel of persons between Eugene and Lane County and the central and eastern portions of the State

of Oregon. In Eugene we have the Zellerbach Paper Company, a wholesaler engaged in the business of distributing paper and paper products.

Harper is in Malheur County. The diatomite I mentioned came to Eugene from Harper. (1657.) It was loaded at Harper and came through by rail from Harper east to Ontario. From Ontario it went north over the Union Pacific and west into Portland. From Portland it went south over the Southern Pacific to Eugene.

We feel that the completion of the east and west railroad across the State into the Willamette Valley, means the greater development of the State as a whole than any other one project
906 could bring us. We feel that with a line 450 miles shorter into eastern markets than the line we have at the present time it will place us on an equality with Southern California in the shipment of our fruits and vegetables. (1658.) We feel that the opening up of the new territory and reaching into new territory and a short haul with lumber would put the mills to work that have been more or less idle. There are idle mills a large portion of the time in Lane County. I don't know how many of them—the small mills are idle now, and the larger mills are not running on full time. But I don't suppose that the mills as a whole have operated more than half capacity during the last year or two.

The construction of this line across the State is deemed by the interests for whom I am appearing and testifying a public necessity as it stands at this time.

Cross-examination:

The Eugene Concrete Pipe Works is the concern that uses diatomite. They have been operating in Eugene (1659) better than 10 years. I don't believe it has been under that particular name. It was originally the Eugene Concrete Works and it is now the Eugene Concrete Pipe Works. I was informed that they had put in a carload of diatomite to make their first test. I know that they got that one carload. I understood that they were using it right along in quantities.

Q. Well, you don't know how they happened to go over there to Malheur County to get it when the same product is available at Terrebonne, on the Deschutes branch, about half the distance, do you?

A. Well, you are reaching into a point there that might be debatable. It was considered that the Harper product was
907 purer than that at Terrebonne. I don't know anything about it, but then that is one of the contentions.

The people of Eugene and Lane County and the (1660) community there generally feel they would like to have a competitive railroad operation. The only service by rail in that territory now is by the Southern Pacific and the Oregon Electric, the Oregon Electric north only. We have never had the so-called Union Pacific system service in there. (1661.)

Q. Well, Southern California does not compete with Western Oregon, does it?

A. Fruits, yes sir. That is, we are not competitors now in a sense, but we would be able to compete with them did we have an east and west line where we could reach it with a reasonable expense of shipping. At the present time the rates of shipping and not so much the freight rate as the icing that has to go with the fruits and vegetables, makes it almost impossible to ship it there.

Q. What part of Southern California competes in products with western Oregon?

A. Wherever their fruits and vegetables are raised, particularly prunes and cherries, vegetables, and the like.

ELMO B. CHASE was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live at Eugene, Oregon. (1662.) I have lived there 31 years.
I am engaged in the production of a general line of outdoor
908 vegetables, ordinarily known as truck crops, such as rhubarb, asparagus, celery, and things of that kind; and also in the greenhouse the cucumbers and tomatoes under glass. That business is known as a partnership. My father and two brothers are interested. That business has been carried on at Eugene for 39 years in October. Myself and partners are interested in this proceeding that involves the proposed construction of a line of railroad connecting Crane in the eastern part of central Oregon with Crescent Lake on the Southern Pacific's Natron cut-off on the west. I have put down in a written statement some information respecting the business myself and partners conduct and their particular interest in this proceeding. (1663.) I prepared it myself. As far as I know it correctly states the facts. I do not have an extra copy.

The benefits of railroad development in opening up new sections of the country, thereby enlarging the trade area of a community, is strikingly demonstrated in the experience of our firm. As stated, we are engaged in a specialized agriculture project with truck crops outside, on about 80 acres of land and about 180,000 square feet of greenhouse space or approximately four and one-half acres.

The principal crops grown under glass are cucumbers and tomatoes; also a flower department. Outside crops, asparagus, rhubarb, celery, cauliflower and other outdoor vegetables.

Capital invested is about $150,000, with annual sales for 1928 estimated at about $85,000 to $90,000. (1664.) That amount represents the value of these products all f. o. b. Eugene.

Labor required, about 25 men during the winter and 40 to 50 men during the balance of the year; that is, perhaps for seven to
eight months. The business was started 39 years ago in
909 October. My father, F. B. Chase, moved here from Kansas without previous experience in this line. The business during that period of 39 years has been conducted on the same farm

that I now operate. From 1889 to 1909, a period of 20 years, the business was only able to show a gross sale of $7,000 at the end of this period. From 1909 to 1919 the volume increased to $36,000, showing the growth of the country and new markets available. From 1919 to 1928 the growth increased approximately to $80,000. The territory covered in sales was the seven Western States, California, Oregon, Washington, Idaho, Montana, and Utah and Wyoming to a slight extent.

All shipments are made by express, in order to cut down the time to eastern markets. The cost in this case, for instance, runs 45 cents a dozen cucumbers into Salt Lake (1665), express charges. In a few cases we have made carload shipments of our products. Those move under refrigeration. The distance moved and the time taken in transit is of very great importance with any fresh product. There is a deterioration in the product itself every hour that intervenes between the time that it is produced and the time that it goes onto the table.

The advantage gained in increased business shown in the development of any new country is much greater if the territory tapped is of considerable climatic differences from your own. When the Coos Bay line of the Southern Pacific was put in operation in 1916, our business was largely local, with a small amount of out of town trade in the southern part of the State. The effect of opening up this new territory upon the volume of business done is graphically shown by the following figures: From 1910 to 1916 the gross sales increased from (1666) $10,000 yearly to $20,000, or about $1,600 a year. From 1916 to 1918 the increase was $7,000, or 34 per cent. From 1917 to 1918 the increase was $9,000, or 33 per cent. From 1918 to 1919 a loss of $600. From 1919 to 1920 a gain of $14,000, or 38 per cent. This makes an average increase for the four years immediately following the construction of the railroads of $8,000 per year against $1,600 for the previous six years. The four years where we experienced that average increase was the period that immediately followed the construction and placing in operation of the Southern Pacific's branch line from Eugene to Marshfield and North Bend.

910

Somewhat of a similar stimulus has resulted from the opening up of the Klamath Falls country with the completion of the Natron cut-off. Business with California has shown a marked increase due to faster express service over the new line, with the result that several months of the year this State, California, uses more of our produce than any other State, with the exception of Oregon alone. That is in cucumbers. Further, we believe that the proposed new cross-State line between Crescent and Burns will add materially to the movement of perishable fruits and vegetables to the intermountain and mid-west sections and result in greatly increased production in the Willamette Valley in this class of produce. (1667.) New markets will be opened for perishables that must reach the

market in a limited time, and personally we believe that such sections as southern Idaho and Utah will provide a ready market for such crops. All of the greenhouse crops are produced out of the normal growing season. They are cucumbers and tomatoes largely.

911 New markets will be opened for perishables that must reach the market in a limited time. Cutting the length of time in transit is the important item with such crops, outside of the question of price. If 12 to 24 hours can be cut from the time needed to reach these markets, it not only means that the goods will arrive in better condition but nearly as important is the fact that on the larger markets, such as Chicago, the rapid fluctuations in price, due to sudden freezes, etc., makes every hour count when trying to get into a good market before other supplies arrive. The broker in such a market keeps his shippers informed by telegraph of the condition of the market and the demand for his class of produce. When a sudden scarcity develops due to any cause, the price is likely to rocket upward and the demand (1668) will be strong. The shipper is immediately notified and very often takes advantage of this sudden market by putting increased supplies in the favorable market. The quickness of service into such a market is reflected very often in the returns received for the crop. This is especially true in the fall and winter crops, when the local outside supply is often eliminated in a day's time by cold weather.

Q. Do you and your partners in marketing your products in the seven Western States you have mentioned, and sometimes as far east as Chicago, encounter any competition in those markets with producers of like products?

A. There are large producing areas in the eastern section of the country, after you get back near the Mississippi River, around Chicago; especially, Davenport, Iowa, Terre Haute, Indiana, are the big producing sections. (1669.)

912 The producing sections I have mentioned ship west. They ship into the inter-mountain country especially. They occasionally go to the coast, but they go all through the Mississippi Valley and into the inter-mountain country. There is no production of vegetables of any size, such as my partners and I produce, in the Southwest, Texas, or Southern California. Our principal competition is with the Illinois and Iowa and Indiana producers.

A careful study of local conditions convinces us that this section, given good transportation facilities, can successfully compete with any other section in the production of out-of-season vegetables under glass. An abundant water supply, mild climate, cheap virgin land, an unlimited supply of economical fuel in the form of hogged fuel or sawdust, low construction costs of greenhouses, makes it possible to produce greenhouse crops here and sell in distant markets at a profit. Recent figures from some of the best greenhouse ranges near Chicago indicate that the cost of fuel for the year averaged (1670) about 7 cents per square foot of ground covered. Our costs here in Oregon were about 3 cents per square foot. Cost

of construction of new greenhouses is reported to be about $1.25 per square foot. That was near Chicago. Our corresponding cost is about 85 cents a square foot. The water supply, which is a very important item in greenhouse work, is abundant and cheap here. The Willamette Valley especially. In our local section wells 20 feet deep will often supply several hundred gallons per minute. We have one well on our place that will throw up to 600 gallons a minute from a 24-foot well. With cheap power rates in effect we find that our water bill will not average over $25.00 per month. This includes the supply used by 12 residents, lawns, outside gardens, and 4½ acres of greenhouses.

913 An early season, which brings crops on faster than in many (1671) sections, is also a great aid in getting into the early market. We find the season is about two weeks earlier in Eugene than in Seattle, for instance.

All these factors taken together mean much in the future development of vegetable growing, both in the greenhouses and outside in this section.

Each new territory opened up or better transportation provided into this already available means increased output and growth.

A careful check of the regions excelling in vegetable production in the United States will reveal that in the majority of cases they are located along or near large bodies of water and subject to other modifying influences. That is, they are found along the Pacific and Atlantic Oceans, around the Great Lakes, or near the Gulf of Mexico. Further, the gradual but nevertheless rapid change in the eating habits of the American people, especially since the war, make it plain that vegetables and fruit are to be the predominating factor in our diet. A 400 per cent increase in the amount of head lettuce, for instance, during the past 10 years shows how the wind blows.

Q. Now, you have already given the figures for certain years of the increase in your company's sales. I wish you would give the amount of the growth sales in 1910, if you have that figure? (1672.)

A. In 1910 there were 10,000. In 1913 they had increased to 18,000. In 1916 they had increased to 20,000. In 1919, 36,000. In 1925, 55,000. And in 1927, 79,000.

914 Q. In a number of sales in the 20 years from 1889 to 1909, what was the number of separate sales that you and your partners made?

A. The volume was $7,000. From 1909 to 1919 the volume was $36,000. From 1909 to 1928 it was approximately $80,000. (1673.) I do not mean that the aggregate for 9 years from 1919 to 1928 was $80,000. I mean from that period they increased from $36,000 to $80,000. That is per annum. (1674.) I estimate our sales for 1928 would be $85,000 to $90,000.

In Lane County there is a considerable production of outdoor crops but none of any size inside. There are small producers, other than our company, in Lane County, with operations under glass. Generally speaking, I think the soil, climatic, and water conditions in

Lane County are very suitable for a large production of outdoor vegetable crops. There is a large body of land of the tupe that is used for crops of that kind, there is the water supply that I speak of, and there is a considerable production for cannery crops at present, much the same crops. It is largely a matter of the market. Vegetables at the present time are being canned in Lane County. (1675.) The chief crops are carrots, beets, string beans, cabbage, things of that kind. Not all of the land in Lane County is suitable for production of vegetables has been devoted to that use. The production of vegetables for shipment in the way I have described or for canning, is susceptible of extension and considerable expansion in Lane County.

With the construction and operation of the proposed cross-State line we expect a material increase in our business, largely, we think, from southern Idaho, Utah, and east. Our markets are much better developed in the northern section of the country, Montana, for instance, and Washington.

915 Q. Are there desirable markets that would be tributary or be reached by transportation over the proposed cross-State line into which you are not selling and shipping at the present time, in your judgment?

A. That would depend upon the development of the country through that section. Any of the eastern Oregon and Idaho sections are good markets, wherever there's people enough. (1676.) Without exception it has been my experience that as new transportation facilities become available our opportunities for increasing our production and our sales increase likewise. I see no reason why the same result shouldn't follow from the construction of the proposed cross-State line.

Cross-examination:

The carload business that we shipped was handled by brokers. I think it went east, probably into Chicago. The ones I mentioned was head lettuce. It moved over the Southern Pacific. I do not know whether it went through the Portland gateway or whether it was routed through Roseville and Ogden. (1677.) I have no details of that. I did not route it. I have never routed any carload shipments. I ship very little by carloads. That shipment was perhaps 4 years ago. I haven't shipped any carloads since.

Q. Now, you spoke of the advantage accruing to you from the construction of the line through connecting up with Klamath Falls. Did that advantage result from consumption at Klamath Falls, or from better availability to California markets?

A. Well, it is both. Klamath Falls is quite a market itself. Their season is entirely different from ours. There is no production down in there of that class of products, and the

916 only competition you have is from southern outdoor crops, and there has been increased consumption there as well as in San Francisco and Sacramento and those districts. We ship into Los

Angeles, but not in any considerable quantity. We ship there through the spring months, from February to April (1678), I should say. We ship to southern Idaho points; to Pocatello, Boise, in through there. We begin in April, shipping through till June, perhaps. That is by express. Transfer would be necessary in fresh shipments. We would have an advantage over the present line to southern Idaho points with the cross-State line as it would be shorter. The shortest line always affords the best service with fresh vegetables.

Q. Well, it doesn't if you don't make the time, does it?

A. It would depend on your transfer. Outside of your transfer it wouldn't make any difference—the matter of hours intervening.

Q. Now, if there was a mixed-train service across central (1679) Oregon, and through limited service from Portland to Boise, if Boise was the destination you would ship by the limited service, wouldn't you?

A. It would depend just on which took the greatest number of hours to get in there. It is time and service, rather than distance.

Population and markets is the problem in the matter of the disposition of produce generally. Without demand there isn't any advantage in rates.

Eugene has grown quite extensively in the last several years. (1680.) I imagine the university has a thousand more students than they did have 4 or 5 years ago. I understand they have there
917 around 3,000 students. That makes some difference in population added there. The local business is a very small factor of our business, and the percentage of the business done locally is constantly decreasing. Certain times of the year around the bay there, California and Sacramento and that district take larger shipments of cucumbers than any other district, but take the year as a whole this State and Washington provide a greater outlet.

We do not ship very much to the Yakima country. We ship into Walla Walla. Spokane is a large market. It is all hothouse stuff that we ship to those long distances. (1681.) The last year or so we got some movement into Utah. It has been rather stiff competition with eastern producers, however. They don't produce locally there to any great extent. Climatic conditions to some extent accounts for that. The climatic conditions haven't proven to be more favorable there for the raising of this product than they are around Illinois, Indiana, and Iowa.

The shipments that were sent to Utah were routed through Portland, then east into Idaho, and down into Utah.

PERCY M. MORSE was thereupon produced as a witness on behalf of complainants and, having been first duly sworn, testified as follows:

Direct examination:

I live in Eugene (1682), in Lane County. I was elected as county surveyor, and appointed as county engineer, market road engineer of Lane County. I am a civil engineer by profession. I

have practiced that profession 29 years, the entire time in the State of Oregon. I have been in railroad employ. I was employed
918 seven years with the Oregon-Washington Railroad & Navigation Company, in relocation and reconstruction and maintenance of way. I was with the Southern Pacific three or four months only, I think. (1683.) That was on the main line through the State, south of Portland, of course. That work was more in the nature of making connections to section owners, replacing maps destroyed by the Southern Pacific fire.

I have been working as county surveyor and county engineer of Lane County for 12 years, so that I think I am pretty familiar with all parts of the county. There is very little of it that I haven't been over.

As to the approximate standing timber resources of Lane County, I can only take the Government reports or viewers' reports—there's approximately 65 billion feet, supposed to be, standing timber in the county. A good deal of that timber is in Federal forest reserves.

Q. Have you made an examination of the country from an engineering standpoint, with a view of ascertaining the (1684) practicability of locating the line of railroad from Eugene to cross the Cascade Mountains and connect up with LaPine, Oregon, on the east side of the mountains?

A. Only as far as the summit, the eastern boundary of the county. East of the summit I am not familiar with the country. I have a map with me that would indicate the approximate location of the proposed route. It is a copy of the Cascade National Forest service map.

Q. Is that the name, Cascade National Forest, of the forest in which the standing timber is located that belongs in the Federal forest reserves, so far as they are contained in Lane County?
919 A. Cascade National Forest. We have the Siuslaw, in the western portion, then some of the Umpqua, in the southern portion. There is standing timber in three separately named national forests in Lane County. Eugent is located just about the center of Lane County. The McKenzie River (1685) flows from the eastern portion to the central portion of the county, where it joins the Willamette. It joins the Willamette just two or three miles north of Eugene.

The route that I went over as an engineer with the idea of ascertaining the practicability as location for a railroad commenced at Eugene or Springfield on the west. From Eugene it went easterly, following the McKenzie River Basin, to McKenzie Bridge. From McKenzie Bridge it left the main McKenzie River and followed a branch, the Horse Creek branch, in a southeasterly direction. It continued that direction until it would reach the (1686) summit of the Cascades near Elk Lake. From Elk Lake it went more in a southerly direction, but still bearing to the east. It would be about 60 miles along the proposed route from Eugene over to the summit

at or near Elk Lake. As to the practicability of that route from an engineering standpoint for the location of a line of railroad, there are no unusual features that would make a railroad location excessively extensive or impracticable. It would be the usual mountain construction.

Q. What timber resources in Lane County would such a line of railroad, if built, serve? Would there be any timber to speak of adjacent or tributary to such a line of railroad, if built?

A. It would be through all the McKenzie Valley holdings;
920 yes, there would be a large amount of timber. The timber tributary to that proposed line is not now served by any existing line of railroad. Some years ago the lower portion of it was logged off by water to Eugene, but—(1687.)

The suggested terminus of the line I mentioned on the east side of the mountains was somewhere in the vicinity of Lapine, in Deschutes County, near the southern portion—near the southwestern portion, near the southern boundary line. In my judgment, I believe there is a feasible route for the construction of a railroad following substantially the route I have indicated between Eugene and LaPine, Oregon, in Deschutes County. (1688.) That route would tap extensive areas of timber west of the Cascades. I am not familiar with it east of the Cascades. I know the location of Crescent Lake. LaPine would be 10 to 12 miles from the route of that proposed cross-State line.

Cross-examination:

The route I have referred to is commonly known as the McKenzie Pass as far as McKenzie Bridge. From there it would follow the Horse Creek branch. There would have to be a development to get a grade suitable for railroad there. (1689.) I went into no details at all about it. It was just a general survey of the country. The distances are such that before you reach the plateau, that the development I believe could be made for a suitable grade. I had nothing but a barometer with me. That was all I used in getting the heights.

I think we can still use up to one or one and a half per cent grades for a main line. I believe they could get a one and a half per cent grade on the route I have been discussing. I don't believe
921 that the cost would run greater than the Natron cut-off cost. The cost of that was pretty large, but they built it. (1690.) The Natron branch was built to handle the north and south traffic. That is very heavy traffic. It is taken from the Siskiyou route and put through this Natron route because of the very substantial economies resulting on that operation. (1691.) It carries the traffic from Oregon and Washington. It was the heaviest traffic that they have. Now I am not qualified to state as to the comparative heavy traffic of the roads here or east, or anything of that kind.

I have been railroading here in the State a good many years and have been a citizen in Eugene. I know there is quite a heavy traffic on the Southern Pacific between Portland and San Francisco.

I personally believe that the line across the State would take a good deal of that traffic that now goes south. The Cascade route, so we have been advised, cost $300,000 or more a mile for miles there between Eugene and Crescent. I don't know. (1692.) I have been over the route. There are tunnels and cuts and rock work; one series of very expensive construction.

Q. And isn't this McKenzie Bridge route considered an even more difficult route than the Natron route that was taken by the Cascade construction?

A. I don't want the commission to think that I am advocating the McKenzie route in comparison to the Natron route. All that I cared to testify was that it was a place that a road could be built to serve as an outlet. There was no examination made to determine the cost or the grades that are possible to be made.

922 It was simply a view of the ground to see whether there were any unusual or outstanding features that would prevent the construction of a railroad.

Examiner ROGERS. Do you know whether the old Siskiyou line had reached its maximum density of traffic that could be handled over that line when the Natron cut-off was built, so that the Southern Pacific simply had to build another line in order to handle the traffic, or was it built simply as a matter of decreasing transportation costs?

A. I would not feel qualified to answer that.

Q. (By Mr. SPENCER.) Now you say there are no unusual (1693) difficulties presented by this route, as I understand you?

A. Yes, sir.

Q. Now every route through the Cascades presents unusual and serious and very expensive difficulties, except perhaps the Hogg Pass, doesn't it? Is there any mountain pass in the West that is as expensive to accomplish as a pass through the Cascade Range?

A. None that I know of. They are all expensive.

I am familiar with the territory in the vicinity of Crescent only in a generay way, on the railroad and in the immediate vicinity. If the proposed line was constructed from Burns to Crane on the east to a point in the vicinity of Crescent on the line of the Southern Pacific, I believe it would be practicable to locate such yards and whatever would be necessary at some point along there. There are yards at Crescent now.

As to whether that is a terminal point, or a division (1694) point on the Natron cut-off, I could not say. I am not familiar with their operation.

I believe it would be practical to put in a yard in the vicinity of Crescent, not necessarily at Crescent.

923 Q. Well, the extent of the development there at Crescent consists of two or three tracks parallel with the main line, doesn't it, and a two-stall engine house?

A. There are other places, though, not very many miles away, where they could develop yards.

There is a great deal of snow there. I know of the snow on the Blue Mountains at Kamela Hill. I did not think there was three or four times the volume of snow here on this Cascade line that there is over there on the Blue Mountains. (1695.) I don't know personally.

WARREN D. SMITH was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live at Eugene, Oregon. I am a geologist. I am now (1696) head of the Department of Geology and Geography at the University of Oregon. I have been on the faculty of that university since 1914, with the exception of two years I was absent. I received my academic training at the University of Wisconsin, Stanford University and University of Chicago. I received my doctor's degree from the University of Wisconsin.

As a geologist I started out as assistant on the Wisconsin Geological Survey, and then I went to the Philippine Islands and was geologist and chief of division of mines there for 10 years; and then I have done a consulting work with the metropolitan water district in Manila, for the various mining companies in the
924 Philippine Islands; and then in this country for the Southern Pacific, for the Union Pacific, for the Oregon Portland Cement Company, for the United States Reclamation Service, and other smaller concerns. (1697.) I have been in China and made a half a dozen visits to Japan, parts of Borneo and the East Indies. I have observed economic conditions in China and Japan to a certain extent. I was in the Philippine Islands nearly 12 years. I made six visits to the Hawaiian Islands.

I have been in every county in the State of Oregon, over every important road in the State, railroad and highway and trail, and some parts of it I know in considerable detail, other parts only by reconnaissance.

As a geologist, it has been my work since 1914 to give particular attention to the geological structure of the State of Oregon. The ascertainment of surface and subterranean water resources within the State is one of our chief interests, the study of structure conditions of the State which would determine artesian (1698) basins. In fact, you can't do that work without a knowledge of structural geology.

Q. Have you been through the portions of the State generally speaking between Crane, Oregon, in Harney County, and westward across there over to Crescent Lake in the Cascades on the west? Have you been to that part of Oregon?

A. I have been through along practically all of those roads. I haven't followed that proposed line throughout, but I have crossed it in various places. I am familiar in a general way with the geological structure and the topography of that portion of the State,

so far as they have been ascertained, the sources of subterranean water supply in that portion of the State, but am not familiar with it in a detailed way, though I have access to the literature.

925 On some of that work we have more detailed information. I have examined and read such literature and think I have most of the information that is available on the subject. I have been through the region in north central Harney County, in northern Lake County, and in the northeastern portion of Klamath (1699) County, and I have material on that region.

My work as a professor in the University of Oregon, and geologist, give me information with respect to soil values or soil characteristics of the soil on the surface of the earth along in that general territory. Soils are all due to the break-up of rocks.

Q. Well, what, generally speaking, would you say of the soil conditions as you have observed them in that territory between Crane on the east and Crescent Lake on the west, of north central Harney County and northern Lake County and northeastern part of Klamath County, with respect to fertility and the ability to grow crops if supplied with water?

A. Well, we have three main types of soil in that region and the region to the south. There the soils on the lake basins, like in the Silver Lake country, we have the soils of the High Desert. Those are mainly adobe soils and not much good; though on the High Desert there are some good soils which if water were accessible would be fertile. Then we have in the western portion, somewhat to the south of this proposed (1700) line, but you do get into a certain amount of it even where the line would cross—you have a large pumice area, which is not very attractive and could hardly be made attractive. It is too porous. That material came probably from the explosion of Crater Lake, and that is marked by the presence

926 of juniper as the principal type of tree. As to what extent of this total area of this so-called desert consists of soil that could be made fertile if water was available, I made no calculations on that, and I could merely make a guess now. Probably with water maybe 30 or 40 per cent.

Q. (By Mr. McCulloch.) Dr. Smith, could you give a more or less general but summarized statement of the topography conditions and the geological structure of the State generally speaking along the line of the proposed route of railroad between Crane on the east and Crescent Lake on the west?

A. That portion of the State is covered by what is generally known as the Columbia lava flow. It is one of the largest lava flows in the world. This lava flow, or series of flows, not just one flow, has been subjected to some folding and faulting, so you have a region there of great undulations in these lava flows with occasional breaks. Those are more noticeable to the south, and there are several places where you can see the material underlying the lava flows, which is made up largely of a volcanic ash, comparable to the famous (1701)

John Day ash beds in the John Day Valley. Now in these depressions caused by the faulting, where one block has dropped down and another stood up, there have been lake-bed accumulations. Those are the fertile areas of eastern Oregon. I would say, in general, that the region is generally misrepresented on the maps. It is rougher than it appears to be. A great deal of the surface of this country consists of lava rock, and a great deal of it has been covered by later accumulations of lake-bed deposits, and then in many places this lava has disintegrated and produced a residual soil. It is not bare rock, except in places. In places there is a lot of bare
927 rock, but in other places you will have quite an accumulation of soil. (1702.) In the main the soil has been the residum of disintegrated lava rock, or transported soils brought down by the streams and deposited in these depressions.

As to information respecting the water resources or the subterranean water resources of this territory, we haven't a great deal of data, but such data as we have indicated that it would be possible, if the proper development work were carried on, to develop ground water resources here 10 times what are now available. But that would be a large-scale development, calling for a State program.

In the Fort Rock country several wells were drilled a few years ago. I haven't paid much attention to this section the last three years, so my information is not of the latest on that. But there were several wells in there around 220 feet deep, one of which yielded 1,000 gallons a minute. Now there are very shallow wells, and I am thinking of a kind of development where wells will go down to 2,500 and even 4,000 feet in depth, as they do in Australia. Then we would get an adequate supply of water.

Q. There has been testimony in this record, Dr. Smith, referring to these wells in the Fort Rock Valley, and the extent to which (1703) they have been used for watering livestock and for the irrigation of tracts running from 80 to 160 or 200 acres of land immediately adjoining them. Do you believe, from the information to which you have had access and the personal observation you have made and your knowledge of the geological structure of this central Oregon county, that the procuring of water from these com-
928 paratively shallow wells you have described, drilled to a depth of between 200 and 300 feet, is generally practicable?

A. Yes. But I don't think they would be adequate, the shallow wells. It is my judgment as a geologist that generally throughout that territory water, at least to the extent obtained in the Fort Rock Valley, might be obtained by drilling some other wells. In other sections farther south, in the Goose Lake Basin, why, they have put in a number of wells since the Fort Rock development. They have got considerable water. There are other sections in the central Oregon country where water could be procured by drilling comparatively shallow wells. The whole of southern Harney is a potential artesian basin. There is a small basin east of that in the White-

horse (1704) region, east of Steens Mountain; there is the whole Goose Lake section, which is not fully developed yet; there is a Silver Lake, of which Fort Rock is a part; and there is a little basin over near Drewsey. Now that is east of the region we are talking about. In my judgment, I consider that the development of the subterranean water possibilities of this territory in central and south central Oregon and southeastern Oregon has hardly begun.

It is my thought that by drilling a 2,500-foot well or a 4,000-foot well, going deeper a flow of water will be struck that would make it unnecessary to pump. I think there are places where they could get artesian flows. For instance, if you go down the Deschutes Canyon, at several places you can see enormous springs, Opal Springs is one of those, where water comes out of there like out of a huge sewer, a tremendous flow of water. The Deschutes is fed largely from such springs, and that whole of eastern Oregon
929 is, in my opinion, at least a large part of it, underlaid by water. And it is a supply that is constantly being fed from the snows of the Cascades chiefly, and I think it can only be reached by deep wells. I think there is a possibility in several of those basins of striking such a flow of water. (1705.) I would not say in every one. It would be expensive. But when they go down in Australia to 7,000 feet to get water, and there is no other way to get it—you can't lift it out of the Snake River or the Columbia River at any price—why, you might have to go down with a well. I can only guess at what the expense would be, as we have no data in the State. We have some reputed oil wells in the State that have gone down 4,000 feet, where they have sunk a lot of money. To sink an oil well 4,000 feet costs somewhere around—it depends entirely upon the terrain, upon the local conditions, labor, and such costs—$100,000, or it might run up to $150,000; it might even be less than that.

Q. (By Mr. McCulloch) Dr. Smith, if a well such as has been put down in the Fort Rock Valley will produce an adequate flow of water for watering large herds of stock, and in addition for the irrigation of alfalfa and other crops for areas from 80 to 200 or 240 acres each, what in your judgment would be the areas that might reasonably be irrigated from the flow of such a deep artesian well as you had in mind, assuming (1706) that one of these shallow wells of 200, 225, or 250 feet will irrigate from 80 to 240 acres?

A. I would not want to testify very definitely on that, as I haven't specialized in that subject. I would say this: That such water should be used mainly for watering stock. That is the way they use it in Australia, and not for irrigation. I think that
930 is a waste of water. But I would say this: You ought to be able to irrigate a considerably greater area than you can from these shallow wells.

As to how, in my judgment, the flow from one of these shallow wells would compare in volume with the flow from such an artesian well as I had in mind, the flow from real artesian wells would be

much greater. That depends upon what you strike, the water stratum, and under what pressure it is, the depth and the structure conditions there, and so on.

Q. Dr. Smith, if the use of water in this south central contry in Oregon and southeastern Oregon from wells were confined to human consumption and the watering of stock with a limited use for irrigation on comparatively small farms, 80 to 200 acres, in your judgment would there be any necessity for the drilling of very deep wells to procure an artesian flow, provided you could get a lesser amount of water for those (1707) restricted purposes from wells from 200 to 300 feet deep?

A. It is just a matter of getting more water or less water. If you are satisfied with a small amount of water, why, they will use the shallow wells. But I am thinking of the greatest possible development of the State in that region, and that can only come about through the boring of deep wells. But you can get a good deal more water than is now gotten from these shallow wells. Nothing adequate in the way of drilling deep artesian wells has been undertaken in this territory. The State began some development in the Fort Rock country, and then, through a reputed program of economy, which I consider to be parsimony and not economy, the State abandoned the work.

Q. In your judgment is the geological formation of this central and south central and southeastern portions of the State such that water and subterranean sources of water can be
931 found in substantial quantities and to a substantial extent by the drilling of wells, either the shallow type from 200 to 300 feet or the deeper artesian wells?

A. That is my opinion, that that can be done and is being done in certain sections now.

I am familiar with the substance known as diatomite. (1708.) I have visited the Harper deposit in Malheur County. Apparently that deposit is extensive. I have made no detailed survey, but the short examination I did make, which was just about a day, convinced me that the quantity there was almost unlimited. As to its quality, that could not be determined without a detailed examination, which I did not make. That deposit was being mined and shipped when I was there. I heard the testimony of Mr. Shelton this morning that diatomite from Harper was used by the Eugene Concrete Pipe Works. That is one of the possible uses of diatomite. To what extent it is being used I don't know. As we call it, diatomite is a rock formation consisting of the remains of diatomes. Chemically the material is about 90 per cent silica, SiO_2, with a small amount of (1709) alumina; that is, Al_2O_3, aluminum and oxygen. All the other ingredients are less than one per cent, even less than a half of one per cent. The color is sometimes a dead white to cream color, depending upon the amount of iron present. Any appreciable amount of iron will color the material. This material at Harper is almost pure white; in places it is dead white, because it has a very

small percentage of iron. It is light; it varies from around 20 pounds to 35 pounds per cubic foot; that is, it is less than water, and that is largely because of the pore spaces in it. It lies in stratified form, and where it has no overburden it can be quarried with
932 a steam shovel. The material can be sawed or shaped into blocks.

The uses of that material in industry are growing very rapidly. There are something over 100 different uses at present. The principal uses are, and the way it is used by this Eugene company is, to strengthen their cement and their concrete. If you add 10 (1710) per cent of diatomite to your concrete mixture, you will increase the strength of your cement about 24 per cent, I am told. I have not made any examination of that myself. That is one of the uses. Another use is for filtration; filtration of oils, filtration of sugar, the clarification of any substances, liquid substances you want to get the impurities out of. Also one of its chief uses, in fact I think its chief use to-day is for insulation in refrigerators, fireless cookers—any number of places where insulation is the object sought. It is exceedingly refractory. You can't make any impression on it with a blow torch, for the simple reason there is nothing there to burn. I am told it is adaptable and is used for the manufacture of such commodities as face powder, polishes, and that sort of thing. I don't know much about face powders, but I should think it would make a good face powder.

Q. Do you know, Dr. Smith, whether there are industries on the Pacific coast, either in Oregon or California, that have occasion to use diatomite in their operations in addition to this cement pipe works at Eugene you mentioned?

A. I know there are a number of industries that use this material and are planning to use it more. I think on (1711) the coast, however, it is still an infant industry. As to whether it is used in the process of refining sugar at the refineries on San Francisco Bay, I don't know about that.

With the growth of diversified manufacturing industries in
933 the Pacific Coast States, I should certainly expect an increasing westbound movement of this diatomite. (1712.)

As to the general topographical features of the country, particularly between the terminii of this proposed line of railroad here, and the character of the country that it runs through as I have observed it in my trips through that country: It is a high plateau, the service of which undulates. There are occasional breaks in it. These breaks are not as large as they are to the south, but there are breaks or canyons. The canyons are not as large in this portion as they are some places to the north and the south. The general elevation is from 4,000 to 5,000. We have the basins around about 4,000 feet, and the high desert, something over 5,000 feet.

Q. As you have observed the country along the route of the proposed line of railroad across the State, are there any decided or sharp breaks in elevation, such, for example, as would be encountered

in a railroad built across the Blue Mountains or across one of the Cascade Mountain passes?

A. Nothing of that kind.

Q. I would like to have you take up, now, please, the opportunities as you have observed them in Oriental markets—when I say that, I will include for the purpose of the question the Philippine Islands, as well as Japan and China—(1713) for products now produced in the State of Oregon?

A. From my knowledge of Oregon I consider that Oregon will ultimately be known as a dairy State. The dairy interests have only begun to be developed, and the one great produce or commodity that might be shipped to the Orient in addition to lumber would be various dairy products. The Orient is conspicuously lacking
934 in dairy products, for two reasons; there is no adequate need for cattle in the Orient, with the exception of Indo-China, and the herds in that part of the world, such herds as there are, are subject to all sorts of diseases. It is almost impossible to maintain a dairy herd in the Philippine Islands. A quart of good fresh milk costs about a dollar in the Philippine Islands. I paid 50 cents a quart for it several times, and some places you can't get it for a dollar. Now, one thing that the Orient needs is milk and butter. The people there are largely under-nourished. Sixty per cent, I believe, and in some cases it has been stated as high as 70 per cent, of the infants born in the Philippine Islands die before they reach the age of one year, and it is largely through lack of nourishing food. I have seen babies fed on condensed milk that was almost sugar, where the baby got too much sugar, and the child died of inanition, and hundreds of thousands of lives could be saved in that part (1714) of the world if they had a good food supply.

The same thing applies, to a certain extent, in China and Japan, and there is a great potential market for dairy products of Washington and Oregon. A lot of this would come from western Washington and western Oregon, but a great deal of it could also come from eastern Oregon and eastern Washington.

Q. When you speak of the dairy products in the Orient, so far as milk is concerned in what form did you have in mind that milk might be supplied to the Oriental markets from Oregon?

A. It could be supplied the way it is now being supplied from Switzerland. The chief brand of natural milk, not condensed, that is in use in the Philippine Islands is Bear Brand milk,
935 which goes into the Philippine Islands under considerable transportation charges, paying duty, from Switzerland,—goes into one of our own dependencies, where the same thing could be shipped from America without duty, and that business isn't touched by American producers. I used that milk for nearly 12 years, carried it by the case with me on my travels. That came from Switzerland. It is a natural milk, and we could put up the same article in this country and get that business if we went after it.

Q. In your judgment, are there possibilities for the development of extensive markets in the Orient for milk and butter (1715), and perhaps other dairy products, such as are produced in the State of Oregon?

A. Well, to show you what could be done, the boat I came back on in 1922, one of the Admiral Line boats, carried fresh milk, frozen, from Seattle for the voyage out and for the time it expected to be in those Oriental ports and the return voyage, seven weeks. They couldn't get it across on the other side. You can get fresh vegetables over there, but it is a very dangerous matter eating those articles on account of amœbic dysentery; owing to Chinese method of agriculture, where they fertilize human waste, you take your life in your hands when you use those vegetables. Every fresh vegetable we used in the Philippines had to be boiled or scalded with boiling water.

As to the possibilities of Oriental markets for hay and feed for animals, such as is produced in Oregon, I don't know what the situation is at the present time, but when I left the Philippine Islands every bit of hay and all the oats and all the grain used by
936 American Cavalry horses (1716) had to be shipped over under considerable expense, because you can't get that over there. You can get a certain amount from Australia, but not much, because Australia hasn't much feed of her own.

Q. Now, Dr. Smith, in the line of your work as Professo rof Geology and Economic Geography in the University of Oregon, from your observations, in your studies, and travels throughout this State, have you formed any conclusions with respect to the desirability in the public interest of the railroad connection that is the subject of this proceeding, and particularly the relation that that railroad development, when completed, would have upon the general development of the State? If you have, I wish you would state them in your own way.

A. Well, I would say that increased railroad facilities would benefit the State, and this particular line, or a line somewhere across central Oregon, would be very desirable, and it would certainly benefit the community in which I live very greatly. My entire testimony is given in the interests of the State of Oregon. In my opinion, the building and operation of this (1717) railroad across the State would unquestionably contribute to the development of the resources of the State.

Cross-examination:

Q. (By Mr. SPENCER.) Well, Doctor, it wouldn't contribute if it wasn't used, would it? It wouldn't contribute to development if it was connected up there at Crescent Lake and no one made any considerable use of it? It would be a waste, rather than a constructive instrumentality is that right?

A. Well, I can't think of it not being used to a certain extent, but certainly if it were not used very much I don't see how it would
937 hurt the State as a whole. It might hurt certain individuals or certain organizations. I don't think this line should stop on

the east side of the mountains. I am thinking of a line that comes clear across the valley and connects with the coast. (1718.) I am not figuring on any competition. I am just figuring on a railroad. I can think of a situation where there might be the proper kind of cooperation between those railroads and still have a line across central Oregon. I don't know how that would be effected.

Supposing that under the transportation act the railroads were to be consolidated and there would only be one line in the State of Oregon, I would still believe that the cross-State line would benefit the State. You have got a vast territory there that isn't served at present, and an additional line, if it could be built so that those building it would benefit, why, it certainly would serve the State. As to whether there should be a merger or not, I don't care to express an opinion on that.

Q. (Mr. SPENCER.) What I wanted to develop is whether or not, in your opinion, you have in mind the construction of a railroad stopping out there at Crescent Lake, in order to develop (1719) central Oregon, the use of the line to be local between Crescent Lake and the East, and depend upon what it could get from local development and what it could bring to western Oregon from southern Idaho.

A. Well, as I expressed the opinion earlier, and as I expressed the opinion to you personally once, I think, I think that if it had to depend upon local business for some time to come it wouldn't pay. I am thinking of a line that would go clear through. It is my opinion that it never could pay unless it had western Oregon business. I didn't mean for all time to come that "it never could pay," because I couldn't say that.

938 Q. (By Mr. SPENCER.) Well, you have had a line now into the best part of the area between Ontario and the Cascade Mountains for 15 or 20 years—extending from Ontario to Crane, and then later to Burns.

A. Well, I don't consider that the best part of that country. I think the best part is around Silver Lake, the Fort Rock country, and to the south of that. I consider that better than around Burns. (1720.) I think there are greater agricultural possibilities. That is just an opinion.

We have a great expanse there in the Silvies Valley and in the Blitzen Valley. I have in mind the country around Silver Lake. To the north of it, and south and west of it. To the south and west of Silver Lake there is some timber.

Q. Now, the big area in the country north of Silver Lake is what is known as the Christmas Lake Valley, and the Fort Rock end of it is the west end of Christmas Lake Valley, and it is a desert area now for all intents and purposes, isn't it?

A. But it needn't remain so. Exploration has to be made to determine whether it would be made so or not. (1721.) I wouldn't say that that area could be reclaimed by a lot of small wells 150 to

200 feet deep, or 250 feet deep. I have expressed the opinion that those wells should be deeper, though a great deal can be done with the small wells. There is a lot of country around Lakeview that is served by very shallow wells, anywhere from 150 to 200 feet deep.

Q. Well, the Lakeview irrigation project, though, has been a success, hasn't it? That is a big project, isn't it, compared with these central Oregon projects?

A. Oh, there are a lot of small independent farmers down there that do their own irrigating from wells.

939 As to whether the big production in the Goose Lake Valley is from that Goose Lake irrigation project, I am not certain of that.

Q. And that country has had great difficulty in sustaining a branch line railroad, hasn't it, although it has got the advantage of the San Francisco market?

A. I don't know to what extent that road has paid. I have no information on that.

Q. Now, these deep wells that you speak of are what you have in mind for reclaiming that Fork Rock country and Christmas Lake (1722) Valley. Now, isn't it true that some of these artesian wells don't flow a substantial volume so as to irrigate any considerable area for any considerable distance from the mouth or outflow of the well; that is true, isn't it?

A. Occasionally you get a dry hole, and sometimes these wells run out of water.

The irrigation I have in mind is from a strong producing well sunk to a substantial depth. I wouldn't say that is the only constructive program of that development, but that is the one that I would favor. I would say that the deeper water must be there if it is to sustain or reclaim that area. The logical thing for a business program would be the sinking of one of those wells to large depth to ascertain whether water is there or not.

Q. Now, I believe that you said that—or did you estimate the depth at 2,500 to 4,000 feet?

A. Well, I am going on what I know about wells in other parts (1723) of the United States and in Australia. It is possible to go down to 7,000 feet. The average depth of well in Australia, I believe, is around 2,500 feet. It would depend entirely on the

940 local conditions as to where you struck water. I would want to go until I struck the water. You have struck water when you get the water coming up out of the ground.

Any development over there in Christmas Lake Valley must compete with gravity irrigation projects.

Q. And, in your opinion, could that be effectively done unless you had a considerable number of strong flowing artesian wells?

A. Well, the point I wanted to make there was that there are (1724) certain areas in that region that can not be supplied with water in any other way than by these wells. As to whether that is true

of the entire Christmas Lake Valley, I am not willing to say that. I haven't made that close a survey of Christmas Valley. A survey is absolutely essential before we can determine what should be undertaken over there. What should be done, the State should make a geological survey of that whole country and determine. There has been something done in that line near St. Mary's, even, but more needs to be done. The United States Government made a preliminary survey as far back as in the early 'nineties, and then they made around 1907, '08, and '09, in Harney and Lake Counties, so we have some information to go on, but that should be followed up now with more detailed survey and actual borings. (1725.) We have two main reports. We have a report of Professor I. C. Russell, who is now dead, former professor of geology in the University of Michigan. He was sent out by the United States Geological Survey in the early 'nineties. Then we had reports made by Gerald Waring; two papers, one on Harney County, one on Lake County, on the water resources. Then the State bureau of mines and geology was making detailed examinations and sinking wells in the Fort Rock country about six years ago; when the State bureau was abolished, work was interrupted.

941 Those investigations showed pretty conclusively that there were artesian basins and the water could be reached. And then I have better information than any of that from well drillers in Lake County, one of whom was a student of mine at the University of Oregon, and he has sunk a number of wells—no deep wells, but anywhere from 100 to 300 feet, all through—well, north and west of Lakeview, and have got water even in areas that the Geological Survey thought were doubtful. They are practically all pumping wells. (1726.)

It is my opinion that so far as this central Oregon country is concerned the first consideration is water before it can succeed. I think a railroad would help those people out while they were getting water. A good many people have left that region for the lack of water. They have left some of the high desert, and some of the lower country. I don't think they have practically all left the Christmas Lake Valley and the Fort Rock country. Most of the people that have left there were on the high desert. There were hundreds of homesteads out on (1727) the high desert, went in there about 1915, and nearly all of them got out. That is all through south central Oregon, east of Christmas Lake, and some west of there, and some south.

Juniper, as I have found it, has been confined to the poorer soils. The main juniper growth, as I found it, is in the region just east of the Cascades, north of Klamath Falls. You get juniper, scattered juniper, all over eastern Oregon, and the big juniper area is in the region of the pumice. I wouldn't say that soil is impossible as far as being productive is concerned, but even with water that pumice soil isn't as good as other soils.

As to whether there is a very extensive stretch of this juniper in hardpan soil for thousands and thousands of acres in
942 the easterly portion of Christmas Lake Valley, I don't know about that. (1728.) I haven't been through there making any detailed survey. I made an estimate that perhaps 30 to 40 per cent of that central Oregon country might be made productive. I don't know whether it would be that high at present.

Q. Now, you proceed from the north end of Goose Lake Valley, at a place where they call Valley Falls, isn't it, where the roads fork, one goes up to Bend and the other goes over to Burns, a so-called road? Now, on that road, as you go over to Burns, you wind around through great upheavals of soil and rock that doesn't grow anything, don't you?

A. There is a lot of unproductive country on that road. I wouldn't say that there is no possibility of cultivating there for a distance of 60 or 70 miles, from Valley Falls, until you get over there near Mr. Hanley's Double-O Ranch. It would be different to produce there as compared with the rich silt soils along the Snake River Valley.

Q. A good deal the same condition obtains as you go over toward Bend (1729) from this country down there at the head of the Goose Lake Valley, isn't that true? You have got a little strip of land there that——

A. There is some of it, some of it in there, but there's a good deal of that that is being reclaimed now. There is quite a little strip of land around Silver Lake, 4,000 or 5,000 acres, perhaps, there is the Chewaucan and the Paisley Valleys, with water on them. Those are the chief areas. I think these are south of the cross-State line.

I consider the Harney and Blitzen Valleys pretty good valleys. That country around Silver Lake isn't barren, it isn't unproductive. It is limited. So are the other valleys limited. (1730.)
943 I don't know about the proportion as to the acres in Silver Lake and Harney Valleys. Blitzen Valley is larger.

Some of this lava soil isn't good. The 'dobe part of it isn't good, but the residual soils, where it is thick enough and you can get water on it it is excellent. There's some places there is no soil at all, but if you can get a couple of feet of soil and get water on it you are all right.

At times north of Silver Lake the winds are very violent.

Q. And they roll this soil from one end of the Christmas Lake Valley to the other, pretty near, don't they?

A. Well, you can't roll that play soil for any distance. In some places there is considerable movement of the soil. (1731.) But that isn't so very serious. If you would cultivate it properly it wouldn't matter.

I made an examination and a report on Alkali Lake.

Redirect examination:

I am not acquainted with the character of the soil around the irrigation projects near Irrigon, Oregon, Hermiston, and those projects.

I don't recall so much juniper around the Bend and Redmond section. The big growth of juniper, as I remember it, is south of this proposed cross-State line, towards Klamath Falls. (1732.) In my testimony I meant to say that we find juniper on our poorest soils. In some cases it is simply due to lack of water, but in other cases it is the type of soil, regardless of the water. The finding of juniper trees in an area doesn't necessarily indicate infertility.

I don't know of any extensive areas of pumice soil along the proposed route of the cross-State railroad.

944 For the proper development of this central and south central and southeastern Oregon country I think that the water is the prime essential. Next to that is transportation. To have a proper development of those sections you have got to either have rail transportation or some substitute. At the present I know of no substitute in those portions of the (1733) State of Oregon for rail transportation. Very difficult to get through there now on account of the lack of highways. To a certain extent a highway would be a substitute for a railroad. It is a substitute in a good many parts of the United States, putting the railroads out of business. In saying that I don't think it is a matter of passengers. It is a matter of moving supplies, commodities, in less or greater than carload lots.

Q. Well, what I was getting at was this, Dr. Smith, do you know of other sections in the United States where such commodities as lumber, iron and steel articles, grain, livestock, coal, are successfully handled in carload quantities (1734) by motor truck, or would you expect the movement of grain, lumber, livestock, and such commodities as that, in carload quantities, to be practicable by motor truck over any system of highways?

A. I know places where they are moving quantities of steel and lumber by motor truck, right in the Willamette Valley, but in general I would say that it was desirable to do the bulk of that by rail transportation, and I don't propose to pose here as an expert on transportation.

I shouldn't think such movement of commodities as I have mentioned would compare, in the volume of units transported with carload shipments of the same commodities by rail.

945 In my judgment one farmer or rancher would not need an artesian well to provide water for livestock and the irrigation of a tract of 80 or 120 or 200 acres. They are now getting along over there with small individual wells.

In my judgment I don't think the exodus of settlers from the Fort Rock Valley that was mentioned by Mr. Spencer in his cross-examination (1735) was contributed by the lack of rail transportation. It was lack of water.

Recross-examination:

There is a good road from Paisley northwest to Bend, and there is a road on the north side of this area from Burns to Bend, but aside from those two there is nothing in there that is comparable to our western Oregon highways. And these are nothing like as good as our western Oregon highways. I think if there were a good highway (1736) from the Fort Rock Valley to the Great Northern Railroad it would help out a whole lot.

Exam. ROGERS. Help out a lot in what?

Mr. SPENCER. In the movement of produce from the Fort Rock Valley, if they could produce. Is there any reason why the produce of that valley, located as it is with respect to the Great Northern Railroad and in respect to Bend, why the people couldn't prosper there if they had water and roads?

A. Well, I might give an example of where they had some transportation down in the case of the Alvord Valley borax deposits, and they had a fair road and they mule-teamed borax out of there down to Winnemucca. They had transportation out, and it was prohibitive. There are cases where proper rail facilities would enable an industry to persist.

946 Q. Well, that is hardly comparable with this, is it?

A. I don't know. It is an example of what lack of transportation meant to an industry.

Q. But you wouldn't speak of settlement in an agricultural area like Fort Rock, if it is to be agricultural, wouldn't speak of that as an industry? It is a development of a community, isn't it? (1737.)

A. Well, that wouldn't be as dependent as an industry moving minerals. Each unit is small in its product, comparatively. It wouldn't be a boxer-car proposition in that region for some time to come. It might be ultimately.

Q. And you know that the great quantity of livestock that comes in from western Oregon into the north Portland yards here comes in to a large extent in trucks, doesn't it?

A. I recall from previous testimony that the movement of a good deal of that stock out of eastern Oregon resulted in a loss due to the fact that a lot of it had to travel on foot a long distance, with the shrinking. I would expect that to be obviated by better transportation. That was a long distance proposition.

Q. But is there any reason why livestock produced in the west end, or in the Christmas Lake Valley, if it could be produced there, couldn't find a delivering station on the Great Northern Railroad, or at any point between that and Bend, at the present time, without any railroad construction?

A. That would be fairly easy, I think. (1738.)

947 Further redirect examination:

As to whether in my opinion the transportation need of an area of 100,000 acres of producing land, say, in the Fort Rock Valley,

can or would be met adequately by motor truck transportation in and out, I would rather not answer these questions on transportation. (1739.)

HAL F. WIGGINS was thereupon produced as a witness on behalf of complainants, and having been duly sworn, testified as follows:

Direct examination

I am a rate and traffic expert. I am employed by the Public Service Commission of Oregon, and I am likewise engaged in independent work. I have been employed in rate and traffic work by the Oregon Public Service Commission between five and six years steadily, and occasionally since, making a total of seven years. Prior to coming with the Oregon Commission I was assistant rate and traffic expert for the Washington Commission for about six or seven years. The work I was engaged in for the two commissions just had to do with rate and transportation matters entirely; that is, the rate departments of the two commissions. (1741.) During that time it was my duty to compile statistical information from various official records.

For something over six year prior to my association with the two commissions I was in the railroad service in the freight traffic department of the Northern Pacific Railway in Seattle, and the Chicago & Eastern Illinois Railway in Illinois. My total years of experience in connection with traffic and transportation matters covers something over 20 years.

I have been engaged in an investigation for the purpose of preparing statistical information and studies in this case.
948 My work in connection with this case has extended almost continuously for several months. In the preceding cross-State railroad case I made a similar study, but not anything like as extensive as in this one. (1742.) I have, as the exhibits indicate, undertaken in the first part to make an accounting for the traffic of western Oregon, particularly the Southern Pacific Company lines in Oregon and short line connections of the Southern Pacific. That first subject I have covered was actual statistics of present movement of Oregon carriers, and particularly over the lines of the Southern Pacific and short line connections. That is one part of the study.

First, as recorded in the first part of the proposed exhibit, I have accounted for the traffic of the Southern Pacific and short line connections, most particularly embracing western Oregon; second, as the second part of the proposed exhibit will indicate, I have shown general and transportation statistics of the Southern Pacific and the Union Pacific lines in Oregon; and, third, compilations allocating traffic and revenues to the proposed cross-State line. I might say that the second part of the study, as proposed in these exhibits, likewise embraces traffic of the Union Pacific lines in Oregon, and, in the main, the studies (1743), unless otherwise indicated, are for the calendar year 1926, the latest available figures that were com-

plete. I have compiled these in three separate exhibits, which I desire to introduce here.

(Said statement so offered and received was thereupon marked "Complainant's Exhibit No. 26, Witness Wiggins.")

(The statement so offered and received was thereupon marked "Complainant's Exhibit No. 27, Witness Wiggins.") (1744.)

949 (The statement so offered and received was thereupon marked "Complainant's Exhibit No. 28, Witness Wiggins.")

I have a copy of that. [Paper passed to Examiner Rogers.] The explanation is not all contained in this. I could not say it is complete. I have briefed it to make it as brief as possible as I explain it. Exhibit 26 is a classified statement of the carload traffic of the Southern Pacific Company lines in Oregon, based upon the carrier's special statement thereof, compiled at commission request, being an actual count for alternate months of 1926 and doubled for the full calendar year. The figures do not include less than carload freight.

In the course of compilation it was found that through using the alternate months of the year 1926 same represented approximately 50 per cent of the Oregon revenues for the year, and it was stipulated as between the carrier and the commission that the multiple two be applied to the results obtained (1745) for the six months enumerated herein to obtain the total figures for the year.

Oregon originations and destinations are by counties and for convenience have designated this traffic by territorial groupings as "local," "intermediate," "transcontinental," "short line connections," passing or "bridge" traffic, etc. As regards the traffic to and from short line carriers tributary to Southern Pacific lines in Oregon, that which undergoes rebilling at the latter's junction point is treated as of Southern Pacific origin, while traffic billed through from short line origin to final destination is stated separately, according to name of such carrier.

950 As the title page of Exhibit 26 indicates, there are series of subdivisions, and for convenience I have designated certain groups or strands of traffic after the terms "transcontinental," "intermediate," and so on, representing in a general way the destination territory to which the western Oregon traffic moved. The term "transcontinental," so-called here, is used in the general acceptation of the term, meaning across country, encountering the Portland, Ogden, or other junctions' gateways. The first page of the exhibit, in addition to being (1746) an index, is also a general description of those terms as I have used them in the compilation. The title "intermediate," by way of explanation, is destination territory that is short of strictly transcontinental, being in the main territory that is adjacent to the Southern Pacific System lines.

Continuing, passing of "bridge" traffic, so-called, is that which neither originates nor terminates in Oregon but moves over the lines of the Southern Pacific Company in Oregon. Local group territory is the general caption under which I have grouped what you might call intra- and inter-county, or intrastate traffic; and, with a few

additions, the last designation, groups any other traffic than already set out.

Now pages 1 to 36, inclusive, show the total carloads and total tons of all commodities, "transcontinental" by commodity groups moving between points on the Southern Pacific Company's lines in Oregon and the various States and countries shown via the Portland, Ogden, and other junctions' gateways; the recap of which, on page 36, accounts for a total of 37,386 carloads or 1,093,458 tons. Of this so-called transcontinental tonnage 8.28 per cent is agriculture; .05 per cent is livestock; 2.18 per cent is mines; 82.26 per cent
951 forest; (1747) 7.23 per cent manufactures and miscellaneous; similar percentages being shown for eastbound as against westbound movement.

As to the relationship in the movement of traffic via the various gateways which I have listed—as shown at the bottom of page 36, bearing in mind that this is a so-called "transcontinental" only, there is for the year 36,434 cars, or 89.43 per cent, moving as eastbound, 1,008,174 tons, or 92.20 per cent of the tonnage eastbound. The first figure is through all gateways eastbound. The percentage of the cars being stated in one instance, and the second percentage being that of the tonnage. The westbound is, for the three gateway designations indicated and accounts for 3,952 cars or 10.57 per cent of the carloads, and 85,284 tons or 7.80 per cent of the tonnage westbound. The totals, both east and westbound, are shown in the lower right-hand portion of the page.

Page 37 shows by counties the total cars and tons to and from Southern Pacific points in Oregon and to and from Oregon points on other roads. The statement is divided into parts (a) and (b) according to direction of movement; part (a) representing (1748) outbound movement by the originating carrier and part (b) representing inbound movement or the reverse movement to that indicated in part (a). As the States and counties involved are lesser distant than the transcontinental I have, for convenience, classified same as intermediate-group territory. As previously mentioned the headings to and from Oregon points on other roads are understood to account for such portions of said connections as is not covered by through billing. Through billed traffic from such short-line connections encountering Portland, Ogden, and other
952 junctions gateways is shown on insert, pages 37–c and 37–d. The total both-way movement for the 12 months accounts for 85,644 carloads or 2,410,508 tons. The traffic to and from Oregon points on other roads (separately stated) amounts to 38,444 cars or 1,193,654 tons. Those figures are given on insert pages you have there, 37–b, c, and d set ahead of page 37.

As a further explanation of this last named traffic, I have inserted supplemental pages 37–a and b, itemizing individual commodities.

Page 38, I have classified or grouped as "local" traffic being the Southern Pacific Company's intra and inter-county local tonnage in

Oregon and totaling for the year 109,766 cars, or 3,959,748 tons. (1749.)

Pages 39, 40, and 41—those are short insert pages, that are under size—represent passing or "bridge" traffic, which neither originates not terminates in Oregon but passes over the Southern Pacific lines within the State and totals for the year 18,276 carloads, which, figured at Oregon annual report averages on traffic other than originated in Oregon, amounts to 342,498 tons. Briefly analyzed 11,208 carloads or 61.33 per cent of the total carloads of this so-called "bridge" traffic moves northbound through Oregon while 7,066 carloads or 38.67 per cent moves southbound through this State. 92.77 per cent or 16,954 carloads of a total of 18,276 carloads of said passing or "bridge" traffic moves between California on the one hand and points in Washington, Idaho, Montana, North and South Dakota, Minnesota, Wisconsin, other Eastern States and Canada on the other, encountering neither Ogden nor El Paso gateways.
953 2.46 per cent moves between New Mexico on the one hand and Washington, Idaho, Montana, and Canada on the other and encounters neither Ogden nor El Paso routing; 4.28 per cent moves between Texas, Louisiana, and other Eastern States on the one hand and Washington, Idaho, and Canada on the other, routed via El Paso, Texas; 0.49 per cent moves between Utah, Wyoming, Colorado, Texas, Louisiana and other Eastern States on the one hand and (1750) Washington State on the other, routed via Ogden, Utah.

The principal commodities moving northbound as against southbound with total cars and total tons of each are shown by the following table, page 41–b.

Pages 42 to 49, inclusive, are condensations in restatement of the so-called "transcontinental" block or traffic classification, showing more readily by commodity grouping, the origination, distribution and gateway routing of 37,386 cars or 1,093,458 tons as treated in pages 1 to 36, inclusive. Average per car loadings are shown in pages 42 to 44 and the percentages of commodities moving eastbound and westbound between Oregon and the various States, territories and countries are reflected on pages 45 and 46 while distribution of all commodities both eastbound and westbound via the Portland, Ogden, and other junctions gateways is indicated on pages 47, 48, and 49.

I can give a summary which will give you an idea of the amount of traffic moving via these different gateways in some relative way. (1751.) That is found on page 49. The recaps that follow along there—you will note the general divisions according to commodity groupings after the Interstate Commerce Commission's classification of commodity statistics, and the recaps are in reality sub-
954 caps for the subdivisions as indicated at the top of the page, but all are drawn in a general recapitulation in the right-hand portion of page 49, the directions being indicated.

Pages 50, 51, and 52 show primarily the distribution of forest products to territory designated "transcontinental" accounting for a total of 27,186 cars or 899,474 tons, averaging 33.09 tons per car.

Pages 53 to 67 show by county origin and destination State the movement of the individual commodities comprising forest products.

Page 68 for reasons indicated segregates forest products from all other commodities, grouping the latter in the lower half of the page. By the same statement totals are shown excluding Klamath County, Oregon, and the right-hand portion of the page shows carloads, tons, and averages per car for each of these commodity groupings for Klamath County only. Briefly, for the year, forest products total 27,186 cars and 10,200 (1752) cars of other commodities, of which 5,292 cars and 418 cars, respectively, were for Klamath.

Owing to weight variations page 69 shows carloads, tons, and averages for logs, ties, and other forest products separately.

The first half of page 70 is an allocation of forest products to Douglas, Jackson, and Josephine Counties, being the three southernmost counties of Oregon immediately west of the Cascade Mountains. A recapitulation of all "transcontinental" by commodity group for east and west movement follows.

Summarizing, from the foregoing figures embracing all traffic reported for the 16 counties, including Klamath, served by the Southern Pacific lines and Oregon points on other lines tributary
955 thereto show: S. P. local—via the gaterways as grouped at the bottom, it might be well to designate via the Ogden gateway 27,218 cars, 318,004 tons; via other junction gateways—and by that it has been explained to mean perhaps chiefly El Paso and more southern routings, that is, the southernmost routings—the entire exhibit is summarized—2,488 cars, 60,258 (1753) tons, or a total of 40,630 cars and 1,192,682 tons. That is the appendix or the folded portion of page 70. No corresponding figures to Item 9, transcontinental outbound, were furnished for inbound traffic, the carrier explanation being that the inbound or received tonnage is negligible. A detailed statement of this traffic is shown on pages 37–c and 37–d.

Pages 1, 2, and 3 of Exhibit 27 embrace a comparative statement of the tonnage of steam roads in Oregon for the five-year period, 1922 to 1926, inclusive, pages 1 and 2 showing commodity detail of the 10 major roads rendering classified commodity statistics, and page 3 summarizing tonnage figures for both large and small roads embracing all carriers reporting to the Public Service Commission of Oregon.

It might be explained here that the United Railways, owing to reclassification, has been included in the so-called "small roads" grouping, although at present rendering its report on steam Form A, large roads.

In Exhibit 28, pages 1 to 3 contain a five-year recap of revenue freight carried by 10 major lines in Oregon rendering on Form A, large steam report, namely, the Great Northern; the Nevada, California & Oregon; the Northern Pacific; the Oregon Short Line; the Oregon Trunk; the Oregon-Washington Railroad & Navigation
956 Company; the Southern Pacific; the (1754) Spokane, Portland & Seattle; the Sumpter Valley, and the Valley & Siletz Railways. Those are all of the large steam railroads serving the State of Oregon, with the exception of the United, as I indicated, rendering on large steam, Form A report.

Page 3 shows the total revenue freight, by commodity groupings, originated in Oregon by all steam carriers of the State rendering the regular annual reports. Pages 4–a to 4–f, inclusive, immediately following, list the 31 carriers embraced in the preceding pages, as well as to show the percentages which each group of traffic bears to the total traffic originated. I think that is self-explanatory. I have used the annual report, commodity classification, the commodity item number as well, for purposes of ready identification.

It is noted that the total tonnage originated within the State on the lines of the 31 steam carriers named herein, increased yearly from 9,171,984 tons in 1922 to 14,238,078 tons in 1926; an increase of 5,066,094 tons, or 35.58 per cent. The total tonnage computed on a five-year basis is 7.87 per cent agriculture; 1.41 per cent livestock; 4.09 per cent mines; 78.05 per cent forests; 6.29 per cent manufactures and miscellaneous; 2.28 per cent less-than-carload merchandise.

Page 4 shows Oregon-Washington Railroad & Navigation (1755) Company revenue freight in Oregon for 1926, setting out in detail the branch line traffic, forwarded and received according to system classification as local, intrasystem and interline. The right-hand portion of the pages shows the approximate percentages of tonnage forwarded and received at the principal stations on the branches named as secured through the auditing department of the company, while the left-hand portion of the pages shows the total freight
957 carried in Oregon as contained in the annual report of the carrier to the public service commission. In relation to the latter this branch line tonnage represents 27.87 per cent of the carloads and 28.9 per cent of traffic originating in Oregon.

Page 5 is a comparative statement of the carloads of commercial freight received from connections by the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line Railroad Company, with summaries by divisions.

When I say 27.87 per cent of the carloads and 28.9 per cent of the traffic, the word "traffic" has reference to tonnage; and that, as explained in the lower right hand corner of page 4, is bearing in mind the possible differences in compilation of the branch line statements and the annual report figures which are submitted in accordance with the Interstate Commerce Commission's classification of commodity statistics. (1756.)

The remainder of the exhibit consists of traffic and operating statistics as abstracted from annual reports of the individual carriers named for the years 1922 to 1926, inclusive. I think the headings in all cases are self-explanatory and the references and authorities therefor are shown in the exhibit. It might be well to explain that the average operating ratio of expenses to revenues is repeated in the freight and passenger statistics.

Exhibit 28, of 16 pages, shows estimated tonnage and revenues on Oregon traffic via proposed cross-State line for the first, second, third, fourth and fifth years following construction. The tonnages conform to the Teutsch report at the then current rates as secured through the commission's rate department, figured on mileages
958 via the proposed cross-State line junctions. The method of allocation to the proposed cross-State sector is that of straight mileage pro-rate based upon percentage relationships of such mileage to the total mileage hauled. By way of recheck, the percentage of total ton-miles of the former to the latter was calculated. To illustrate: Column 1, page 1, first entry, shows the mileage Eugene to Chicago via Crescent Lake; column 2, showing point of origin; column 3, assumed destinaion; column 4, the commodity; column 5, number of carloads; column 6, total number of tons; column 7, the rate per hundred or per car as indicated; column 8, the rate per ton of 2,000 pounds; column 9 (1757), total revenue obtained by applying the rate per ton to the total tons shown while the rate per ton mile as stated in column 9 is the rate per ton divided by the miles hauled.

Columns 11 to 17 represent the remainder of the calculation, including allocation, showing the distance hauled over the proposed cross-State line between points shown in columns 12 and 13; column 14, showing the total ton-miles over such cross-State sector and column 16, stating the percentage relationship of cross-State haul to total estimate haul. Column 16, by way of allocation of revenue to the cross-State line represents this percentage of total revenue or the straight mileage pro-rate of column 11 to column 17. As indicated, column 17 is the average rate in cents per ton-mile over the cross-State sector as obtained by dividing revenue footings in column 16 by total ton-mile footings in column 14.

The term "general average rate per ton-mile" appearing after certain totals throughout the exhibit represents a similar calculation to the one last described based upon all of the commodities comprising one general commodity group, as for example,
959 "Fresh fruits," being occasioned by the variations in the rates therefor.

Pages 1, 2, and 3 embrace eastbound traffic for the first year while pages 5 and 6 similarly figured represent westbound for the corresponding period. A recapitulation appears at the bottom of page 6 following a calculation of first year estimates (1758) figured on the alternative of deducting traffic for Klamath, Jackson, and Josephine Counties from the tonnages shown on pages 1, 2, and 3 on the

theory of immediate construction of the proposed Alturas line. The formulæ are the same throughout the exhibit and the recaps reflect the results of the two bases.

Pages 7 to 16, inclusive, represent in abbreviated form similar calculations for the third, fourth, and fifth years, the second year being the mean of the first and third years.

The details of calculation supporting the rate per ton mile in column 7, pages 7 to 16 are readily traceable in pages embracing the first year traffic. The asterisk indicates where averages have been arbitrarily applied as in the case of Fort Rock.

Inasmuch as there are no published rates from certain of the points or junctions indicated on the cross-State line intermediate application of existing rates as from Eugene or Ontario, for example, have been applied in some instances. In other cases intrastate distance scales for the mileages affected, according to the single or joint line hauls involved, have been applied. References and authorities are shown in the exhibit and by the detail afforded in first year pages are readily checked.

Page 9 shows alternate calculations for the third year traffic due to the proposed construction—Klamath to Alturas.
960 General recaps for the five years at alternate bases follow (1759) at pages 15 and 16.

By separate exhibit of three pages tonnage and revenue calculations, after the method used in the Oregon traffic, are shown for movement from the " ten southwestern Idaho counties " via the cross-State line. The columns, while necessarily abbreviated in typing, were computed in all the detail of first year Oregon calculations and represent all the factors essential to a recheck if desired.

I believe the Idaho figures are in every instance attached to that last Exhibit 3, but I have to state that there are a few revisions which are in the course of properation, and if the exhibit is attached to those exhibits I intended to detach it, but if it is attached to the third exhibit, or Exhibit 28, I wish to withdraw it at the present time until the revisions now in the course of preparation are made. I intend to represent that in a separate exhibit. I wish to present that by way of supplemental exhibit.

The territorial designation, " 10 Southwestern (1760) counties," has been supported by Idaho witnesses, and I understand represents the counties of Ada, Adams, Boise, Canyon, Elmore, Gem, Owyhee, Payette, Valley and Washington. They are not included in Exhibit 28 at the present but will be included. I have included nothing for the southwestern Idaho tonnage at this time. I might explain that that exhibit was attached to the copy that I had. I expect in my supplemental exhibit to have drawn together the total tonnage from Oregon, Idaho, and all States that are involved. There are certain witnesses yet to appear, whose tonnage statistics will figure in that, and I wish to dress it all down in one general summary and summarize it into one brief statement.

961 When I spoke of revisions it had nothing to do with this. It could be stricken from the record, so far as the explanation of the revision. It in nowise pertains to the Exhibits 26, 27, or 28. (1761.) It refers to something to be done. I endeavored to explain, thinking that the exhibit had not been detached from 28. (1762.)

[File endorsement omitted.]

962 PORTLAND, OREGON, *August 13, 1928.*

HAL F. WIGGINS, resumed the witness stand and further testified as follows:

Cross-examination:

The first 36 pages of my Exhibit 26 are analyses of the traffic originating on and destined to points on the Southern Pacific lines in Oregon—traffic transcontinental in character, encountering the gateways indicated. The first 36 pages did not include traffic local to the line. Nor do these pages include traffic originating on the Southern Pacific lines in Oregon and destined to so-called inter-mountain country except as the States grouped in the upper portion of the title page would indicate. It is not the intermediate group so-called. (1763.) Although intermediate group territory shown on the title page is Arizona, California, Canada, Winnipeg and west; Mexico, Nevada, New Mexico, Oregon points on other roads, and Washington, that is not discussed or included in the first 36 pages. Those pages pertain to traffic from so-called transcontinental group territory to Southern Pacific points in Oregon, and from Southern Pacific points in Oregon to the group destinations stated. This so-called transcontinental group traffic includes all points embraced in the 16 counties which the Southern Pacific serves, including Multnomah and Tillamook Counties. (1764.) Tillamook is west of Portland, but for northbound stuff it would come through Portland. There would be no occasion for eastbound stuff coming into Portland. It would come to a junction south of Portland. I believe Willsburg is a junction, or it could come out other ways, but it would come either 12 or 15 miles south of Portland, I would say. Willsburg is 8 or 10
963 miles—I am not certain—from the main yards and shops of the Southern Pacific lines in Portland. It is some such distance as that. However, as I stated, there are other ways out and it would probably go from Beaverton south to Cook and out that way. There are two or three entrances in there; or, it could be routed down the west side, leaving the Tillamook line at Hillsboro. (1765.) I don't know fully the prevailing practices as to routing and handling there. I assume carrier convenience might enter into it to a certain extent. I should say that carrier convenience is reflected by the current operation. It is my understanding that it is through the Willsburg junction, particularly for northbound. That is the junction, I should say, going into Portland.

Q. Now do you have in mind this tonnage thus analyzed, speaking now of the tonnage to and from transcontinental group territory

to the territory served by the Southern Pacific lines in Oregon; do you have in mind the consideration of all that traffic as available for the cross-State line?

A. No; I would not say all, yet it is the so-called transcontinental strand or group which it was the purpose to lift up from the entire traffic so that the commission could see the volume of that tonnage.

Q. Yes; I am not undertaking to criticize the exhibit; I just want to know the fact as to whether in the exhibit and your estimates you have included all this traffic, so-called western (1766) Oregon traffic.

A. Well, the exhibit in its entirety embraces all of the traffic, and that is the one particular transcontinental strand or segregation of that traffic.

Q. And to that traffic you applied the existing rates?

A. No, no; I have applied no rates to that traffic.

Q. Well, how do you get your estimate of earnings there?

964 A. Well, I think, if you will recall the Newell report you will recall his own explanation of the manner in which he has handled such traffic as he has drawn from western Oregon, called "diverted traffic." I have not attempted to rate that traffic in the exhibit there, but I have rated traffic which we style "created traffic," as the exhibit indicates.

Q. Well, how did Mr. Newell get his estimates? I understood him to say that he obtained them from you.

A. He used the count of the traffic as embraced in the exhibit as a basis for the cars which he used.

Q. Yes; but he made an estimate of earnings on the traffic through to destination and from originating points east to western Oregon points, and I understood him to say that he obtained the rate data which he applied from you.

A. Well, that pertains to created traffic, Mr. Spencer, and he has his own formula for any costs or other charges applied to this so-called transcontinental traffic from western Oregon. His report, I think, cares for that entirely. (1767.)

Q. I a mnot asking you about the charges or the expenses incurred in the movement of the traffic, but he does incorporate all of this traffic in his estimate of earnings; that is, all the traffic which he assigns to the cross-State line, he applies the earnings on that traffic all the way through to its destination, in both directions. Now, did you furnish him those figures?

Exam. ROGERS. I think Mr. Newell in his exhibit computed the savings on that certain traffic and not the earnings.

The WITNESS. He has his own formula for the computations surrounding that traffic. I did not give him any revenues on that traffic. I gave him the cars and tons as embraced in the report. The same cars and tons are used as a basis in Exhibit 26.

965 Exhibit 28 carries estimated earnings allocated to cross-State line, traffic created; traffic that we consider would be created as a result of the proposed construction. (1768.) That created traffic is east and west traffic, to and from both directions

across the State line. I go as far east as the southwestern Idaho section for originating created traffic, as indicated in the exhibit. (1769.)

The purpose of analyzing this traffic originating in western Oregon and destined to transcontinental territory, and from transcontinental territory to western Oregon, was to lift up to commission vision the volume of the transcontinental traffic from and to western Oregon. I just wanted to show the present volume of the traffic as is. As to whether I am suggesting by that that it is available for the cross-State line, or would so move, I consider that very largely it is traffic which might properly avail itself of the shortest possible route to destination.

Q. And does your analysis show what part of the traffic would be, in your opinion, available for the cross-State line?

A. Well, I believe that all cars that have been shown here, I think, are reached by the cross-State line the shortest distance.

Q. What page indicates the traffic originating in western Oregon destined to transcontinental territory, or originating in transcontinental territory to points in western Oregon, that would, in your opinion, move by the cross-State line?

A. Well, it isn't exactly segregated in that way. Here is the thought in connection with that, to answer your question: So (1770) far as Oregon is concerned, taking the Ogden gateway east, the point of division, or equi-distant point, for example, going via the cross-State as against Roseville, is well south of the Oregon-California line. I think it is down on the Southern Pacific
966 there about Lamoine, or some point considerably south of the Oregon-California line, therefore, all of Oregon going eastbound in the direction of Granger, for instance, is reached shortest via the proposed cross-State line. That is, as between the cross-State line and as between the Roseville-Ogden line.

Q. But where is that point when you take into consideration the existing railroad of the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line Railroad Company?

A. Well, you come up north of Salem, Oregon—I think it is up north of Fairgrounds, I believe, is the equi-distant point around through Portland and Huntington east as against via Eugene and the proposed cross-State line.

Comr. McMANAMY. That wasn't the question, was it? As I understood, the question was, where was the point as between the Oregon-Washington Railroad & Navigation Company and Roseville?

Mr. SPENCER. Yes, sir; Mr. Commissioner. (1771.)

A. The Oregon-Washington Railroad & Navigation Company and Roseville?

Q. Yes; for the moment, put out of consideration the proposed cross-State line and deal with the existing routes—the Southern Pacific route via Roseville and Ogden on the south and the so-called Union Pacific system route, the Oregon-Washington Railroad &

Navigation Company, on the north, to the east, and tell me where your dividing point would be.

A. Well, I thought I had that here available. I don't seem to—I believe that is—the equi-distant point, I think, is about 260 miles south of Portland.

Q. Around Grant's Pass?

A. No, sir; that would be near a place called Chinchalo, I believe it is. It is in the neighborhood of Leland, I think. That is a little better known. However, the exhibit, so far as that is
967 concerned, or the grouping of the traffic, was with a view to the shortened distance via the proposed cross-State line?

Exam. ROGERS. How far down would 260 miles take you, Mr. Wiggins?

A. It is 198 miles to Roseburg. Leland is intermediate Roseburg to Grant's Pass. Roseburg shows on most of the maps. (1772.)

Q. Take you down to about Glendale somewhere, wouldn't it?

A. Well, every map seems to differ a little bit in the naming of those stations, but——

Q. Well, you know the distance from Portland to Roseville, do you not?

A. Yes, sir.

Q. It would be half that distance, wouldn't it?

A. No, sir; I don't think it is quite that. I don't think it is that much.

Q. Well, what is the equi-distant point between Roseville and Portland on the Southern Pacific?

A. Well, it is half of 642 miles. I can——

Q. That is 320 miles?

A. 320 miles, and 320 miles down the line would take you to——

Q. Medford, wouldn't it?

A. Tolo. That is——

Q. Well, Tolo, is just a few miles above Medford?

A. Yes; it is about ten—yes; some ten miles north of Medford. Medford is down near the California line, and that is half way between Portland and Roseville. (1773.) I know how far it is from Portland to Granger on the Union Pacific system lines—it is about 932 miles. From Roseville to Granger, I think it is 822 miles. In my consideration and analysis of this traffic and its possible routing, I have considered the Oregon-Washington Railroad & Navigation Company route from the standpoint of distance,
968 just the same as the southbound routing. We have computed the cross-State distance against both the northbound and the southbound. As between the cross-State route from western Oregon and the existing route of the O.-W. R. & N., I figured that the equi-distant point would be something north of Salem—that is where the mileage would break. Fairgrounds is a few miles north of Salem, 5 or 6 miles, as I recall. (1774.)

Q. And the route through Portland from all Willamette Valley territory, north through Portland from all points of origin now in

the Willamette Valley, is much more favorable from an operating standpoint to Portland than it would be up to Crescent, isn't that true?

A. Well, I could hardly undertake to say as to that. I consider the——

Q. Well, how many years have you been acting in traffic matters in this territory, Mr. Wiggins?

A. Over 15.

Q. Yes, sir; the rates on the Southern Pacific lines in the Willamette Valley are influenced and limited by water competition, both actual in the past and potential now, isn't that true, on the Willamette River?

A. At various times in the past there has been some boat operations on the Willamette, yes.

Q. And you know that it is a moderate water level grade——

A. Yes.

Q. From Eugene to Portland?

A. Yes; the Willamette Valley is——

Q. And you know that you are climbing on a 1.7 grade from Eugene to the summit of the Cascade Mountains to reach Crescent Lake?

Mr. DEY. 1.8. (1775.)

969 Mr. SPENCER. 1.8 grade?

A. About that.

Q. Yes; and you say that you hesitate to express an opinion whether it is advantageous from an operating standpoint to operate from Eugene down to Portland on that water level grade, on an old seasoned main line track, as compared with the movement from Eugene up over the Cascades to Crescent Lake?

A. No; I don't, but you are not taking into consideration the Blue Mountain section of the Oregon-Washington Railroad & Navigation Company operation.

Q. I am just asking you about the route from Eugene to Portland?

A. As against Eugene to——

Q. Crescent Lake; yes, sir.

A. To Crescent Lake. Well, the former is a water grade; the other one is up grade about what you stated.

Q. Now, the climb—it is about 350 elevation at Eugene, is it not?

A. I think something like that.

Q. Above sea level?

A. I think something like that.

Q. And it is some 4,800 or 4,900 feet elevation at the summit of the Cascades on this existing Southern Pacific line to (1776) Crescent Lake?

A. I don't recall exactly, but something like that.

The Southern Pacific folder shows the elevation at Crescent Lake to be 4,779. Cascade Summit is stated as 4,840. The elevation on the Blue Mountains, to which I referred, at Kamela, I think, is something over 4,000. (1777.)

As to where the heavy volume of traffic originates in western Oregon on the Southern Pacific lines, I think that the Willamette Valley might be considered the hub of the traffic. The heavy
970 producing counties, simply from an agricultural standpoint, are Lane, Linn, Marion, Polk, Benton, Yamhill, and Washington—they are among the heaviest. Those are Willamette Valley counties principally; and the heaviest tonnage originating in lumber.

Q. And, as manufactured to-day, the lumber from western Oregon originates largely in Lane, Coos, Columbia, and Tillamook, does it not, and Clatsop?

A. Douglas—I have those arranged in order, I think, here. (1778.)

Q. I am not asking you about the stands, but the lumber really is manufactured and mills operated and the tonnage afforded originates in those counties?

A. Yes; Lane, I should say, is representative; the Coos country feeding in through that way. (1779.)

On page 37–a of Exhibit 26, I list traffic which originates on some of the small railroads in western Oregon, certain short-line connections, and which is delivered to the S. P. lines in Oregon. I gave a list of all of them; they are listed alphabetically on page 37–c. I would not say they are all the roads originating traffic in western Oregon other than the Southern Pacific lines, the Oregon Electric, and the S. P. & S. They are the principal ones. There are perhaps some additional lines, but those are the short-line connections, as listed by the Southern Pacific, delivering traffic to it.

Q. Now, there is not any interchange for eastbound business between the S. P. & S. or the Oregon Electric to either the Southern Pacific or the Union Pacific, is there?

A. Well, there is a general—I don't know just what the——

Q. I mean through rates. There is an interchange, of course (1780), but I mean, do you know whether there are any through joint rates from points on the Oregon Electric Railway in western Oregon, or on the S. P. & S. lines in western Oregon and
971 the Southern Pacific or the O.-W. R. & N. for eastern destinations?

A. The lumber rates in the main from western Oregon apply by either the north gateway or the south gateway. As to your physical connections, I am not just positive about those.

Q. I am not asking about physical connections, but I am asking about the joint rates and whether any arrangement obtains now whereby this business originating on the S. P. & S. or the Oregon Electric in western Oregon can go via the Southern Pacific east or via the O.-W. R. & N. east.

A. I have just forgotten the tariff provisions in regard to that. Generally speaking, we can route either way.

A large number of the cars on page 37–b of this exhibit undoubtedly is local to the lines here in Oregon. The division, however, is later segregated according to the gateways, as the Ogden gateway,

which they encounter. Pages 37–c and 37–d set out what I am mentioning; 37–d, for example, indicating the routing eastbound.

Q. Well, that routing as reflected by page 37–c is all routes, is it not—routes Portland gateway?

A. Well, if it fell short—if traffic went out and fell short (1781) of the Ogden gateway, it would not be shown there, see!

Q. On page 37–c?

A. No, sir.

Q. But this includes, 37–c, Ogden and other junctions gateways, does it not?

A. Well, yes; used in the transcontinental sense.

Q. Yes; now by that statement of the Exhibit, 37–c, there originated eastbound on these various small carrier's short lines, as I understand this statement, at Portland, there originated a total of how many cars via all gateways—3,244 cars?

972 A. A total of 3,244 cars, or 99,224 tons, encountering the Portland, Ogden, and other junctions gateways. That is so-called transcontinental purely. All the other would fall short of these gateways.

Of that 3,244, there would be moving via all gateways east through Portland—that would include the Northern Pacific, the Great Northern, the S. P. & S., and the O.-W. R. & N.—722 cars. That is the total for 12 months via the Portland gateway. (1782.) And via the Ogden gateway from this carload business moving eastbound originating on these short lines, 2,430 cars, and via other junctions, 92 cars. Other junctions, besides Portland and Ogden, for that business could be El Paso or California junctions. Bearing in mind that is must be understood in connection with this exhibit, page 37–c, that this is so-called thorugh billed traffic. It is not all of the traffic that the Southern Pacific receives from these designated short-line connections, for the reason that if there are no through billing arrangements, as in the case, probably, of a great number of them, the Southern Pacific has reported it as originating on the Southern Pacific and it would, therefore, be embraced in pages 1 to 36, inclusive. But this is so-called through billed, being some instances of through billing arrangements with such short-line connections. (1783.)

Page 37–d shows at a glance the distribution by State or county, of the traffic which is eastbound traffic that is contained on page 37–c. It is that portion of through transcontinental traffic from these short-line connections that go via these gateways designated. And so far as I know, that through Portland goes via all routes.

To explain again, this page 37, to begin with, it represents a general territorial designation which, with the exception of the northern territory, is directly contiguous to Southern Pacific

973 lines or Southern Pacific system lines, and in addition to the traffic from these counties indicated at the head of the page in Oregon to these States and countries designated is shown the

(1784) traffic from Oregon points on other roads; in other words from these short-line connections, that being traffic presumably which the Southern Pacific Company took into account at the junction point and probably went forward on S. P. billing; in other words, traffic which, so far as we were enabled to learn, did not carry through billing.

Q. Well, there is not anything in this traffic you have analyzed and presented on page 37 that affects the cross-State line, is there?

A. Well, there is none I believe that encounters the Ogden gateway—the Portland or Ogden gateways—as I understand this. I think that in most instances there—in California, for example—there would be no occasion to go through the Ogden gateway. Nevada, Arizona, might go through southern California connections; New Mexico likewise; Washington——

As to whether Nevada traffic westbound would go through the Ogden gateway, it might or might not. I don't think that it would necessarily. It was styled as that segregated from the Ogden gateway routing. (1785.)

Comr. McMANAMY. Before we get away from this exhibit, page 37–c, I notice you have under the heading "Westbound" the statement "None reported." Does that mean that for lack of records or other reasons you gave no consideration to traffic which originated in the East for points in central Oregon?

A. On this westbound accompanying traffic there, manifestly there is some. We accepted, however, the Southern Pacific's explanation, and the fact that they recorded it negligible. Under the cir-
974 cumstances, we have not endeavored to secure detailed figures on that. Certainly on these short-line connections where the mills are in operation there would be some commodities.

Comr. McMANAMY. I don't refer to that; I refer to the through traffic that moves to all western points in considerable volume, such as, for instance, farm machinery, logging machinery, mill machinery, furniture, and commodities of that kind, which do move westbound in considerable volume and which of course move to all important points in the West.

A. That is exactly, your honor, what I had in mind in my answer, traffic of that character. But, as the exhibit indicates, this block, if I may classify it so, of transcontinental traffic in connection with these short-line connections was not originally secured or reported. It is supplemental, and the detail involved was considered disproportionate to the volume of westbound that would go in there. Under the circumstances (1786) we accepted the carrier's explanation of it.

Comr. McMANAMY. I was trying to get away from short-line connections and take the main-line movement. The Union Pacific originates and handles for at least a portion of its line a large share of the traffic that comes to all parts of Oregon?

A. Yes, sir; it is reported; the both-way movement is reported in the first part of the exhibit, pages 1 to 36. In the main, as regards the Southern Pacific proper, but not to these tributary or short-line

railroads, due to the explanation offered. The westbound transcontinental traffic movement and the transcontinental strand, which we hope to hold up to the view of the commission, is shown in the exhibit.

Q. (By Mr. SPENCER.) Now right in that connection, your explanation as to the lack of traffic westbound for these des-
975 tinations on the short-line railroads, isn't it true that the (1787) commodities that move in would, as a rule, move in less than carload?

A. Well, in some instances. In other instances I would not say so. Take the matter of mills and their supplies and machinery, and so forth, that would not necessarily; it would probably be carload. There would be a mixture. As to whether it would be any substantial volume, I haven't the figures in connection with the short line connections, as the report indicates, but I am positive there would be some. That westbound traffic would move to the end of the joint rate, wherever the joint rate carried it. It would be billed that far.

Q. And ordinarily as to miscellaneous freight of this kind moving transcontinental, the destination would be Portland or some of these points on the Southern Pacific, would it not?

A. It might be anywhere in the western Oregon territory, Willamette Valley, Eugene.

Q. It would not be, unless these small roads had joined in the tariff and had become parties to the joint rates, would it?

A. Oh, it would be billed through to the termination, as far as the joint arrangement carried it. It might be rebilled. (1788.)

Q. If it is rebilled it is reflected in your statements 37–a and b; is that right?

A. 37–a and b plus the through billed, 37–c and d, would account for all of it.

Comr. MCMANAMY. Now will you clear up one point for me. You say that it would be billed through to the junction point with the short lines. Have you in mind the approximate number of
976 short lines out here that have combination rates, that do not have through rates to destinations? What do you mean by the short line which would not handle it under the through billing?

A. Well, there would be roads, Mr. Commissioner, which are not a party, perhaps, to transcontinental tariffs, some little sprinkling; but I think in most instances that there are either through rates or arbitraries over certain Willamette Valley points which would carry this traffic to destination. To illustrate my point, I have in mind roads which would not. I have in mind what I would call a sprinkling of short line logging roads, particularly, in some instances perhaps not measuring up to so-called standard operation, which might not be parties but which the tributary to junction points in western Oregon, that perhaps mark the terminus of transcontinental through rates, or might even be intermediate thereto but who have not come into full tariff recognition. (1789.) In those instances they would undoubtedly move up to or out on local roads.

Comr. McMANAMY. That would be roads which are not common carriers?

A. I don't believe even that all common carrier roads are parties. I have not checked for all of those, but as this exhibit indicates here there are other roads than those named here, some in fact that are not listed at all, which are in a sense feeders, undoubtedly move up to the point at which they connect with transcontinental carriers. It would move beyond under additional charges locally. It would be in excess of the through rate.

Comr. McMANAMY. Yes; but the through rate up to what point? It would not be paid out of the through rate, in other words?

977 A. Charges would simply be, of course, additional to the through, which would maybe land in close proximity, if it happened to be on a line that was in full standing or recognized as a party to the tariff. (1790.)

The through lines, the transcontinental lines have performed their full service and they are turning the shipment over to some line or company which does not participate in the through rate. That would be the practice. I might say by explanation, it has been my observation in the northwest here that there is more or less leniency toward this scattering of small lines that come into existence as lumber feeders of sawmills tapping new lumber and the exaction of standards by way of operation have not been very great. There comes a time in their evolution when they seem to logically become a party of controlling tariffs, but sometimes there is a long period of years when they go along and in some instances reporting to neither interstate nor State commissions.

Comr. McMANAMY. How can there be leniency in this respect? They are either interstate carriers or they are not; they are either common carriers or they are not. They either participate in the through rate or they do not.

A. That is true as to the tariff. There is pretty much a distinct line there that can't be crossed; certainly as to the filing of concurrences which serve to draw the line pretty closely there. But my point is that oftentimes in the past rather than work undue hardship on those roads that are boosting and helping these (1791) mills, and are in a way incidental to the milling operations, they have not been pressed on standards of operation and that sort of thing to

978 rush them into the common-carrier class as quickly as possible.

Comr. McMANAMY. But all that we are dealing with, so far as I understand it, is the rate. Now, if the transcontinental carrier moves this carload traffic to the junction point with the logging road, that is not even a common carrier, consigned to a mill up on that logging road, which perhaps is the owner of the logging road, so far as the transcontinental movement is concerned the shipment has reached its destination at that junction point, hasn't it?

A. Yes, sir; I believe that is true. And I think it is true that what is done with it beyond that does not affect it in any way—the transcontinental rate or the provisions of it. As I understand it,

you understand, of course, there are some instances in which there are arbitraries over the so-called transcontinental lumber rate from western Oregon. I have in mind, if I am not mistaken, the instance in which there was a cent and a half per hundred on the Valley and Siletz Road over and above the through transcontinental rate. As to whether that was absorbed by the through carrier, (1792) I don't know as to the disposition, but that was an instance, and I believe that it reached the attention of the Interstate Commerce Commission.

Comr. McManamy. I was thinking more particularly of westbound traffic which is in carload lots, where it moves and is distributed over these small lines, and I was trying to get an understanding of just how that fact would affect the rate or its divisions.

A. Perhaps an example like corn from Nebraska, that might move westbound and filter into western Oregon, of which there is a substantial quantity at the present time; there it would come as
979 far as the transcontinental rate would carry it, say Eugene, or some point like that; intermediate it might encounter a short-logging railroad that had been in existence for a number of years. There might be some dairying, and agricultural, and general pursuits slowly set up along there——

Comr. McManamy. Without wanting to interrupt, would that be intermediate or would it be beyond Eugene after the shipment had reached Eugene?

A. Well, it would in a sense, of course, calling for further transportation, be beyond, the example is typical throughout western Oregon; the logging road might be anywhere tributary to the branch, I would not say that of the immediate basin of the valley, but outlying lines of the Southern Pacific system. (1793.)

The situation with respect to the short line railroads is that in the main they *ogirinate* lumber traffic. That traffic in the main is eastbound. With respect to that eastbound lumber traffic, as they became parties to the tariff they have for a number of years uniformly enjoyed the group rate that obtains in the lumber producing areas west of the Cascades. I mentioned an exception, as I recall, in the case of the Valley and Siletz. There I think is an example in which there was an arbitrary, as I stated, over the so-called transcontinental lumber rate.

Q. Well, I am wondering whether there is any exception to it since the decisions of the commission here in numerous cases known as the Tap Line cases?

A. I don't know how many there are. I haven't checked those up. As to whether there is any arbitrary for lumber originating on the Valley and Siletz over the coast group rate, it may have been corrected. I am not certain as to that. (1794.) Generally
980 speaking that is the situation.

Q. Now of course they are parties to this transcontinental tariff covering the transportation of this lumber if they enjoy through group rate?

A. They would be parties to the tariff. They get their division on that commodity, whatever it may be, out of the through rate.

Q. Now they are small institutions, without extensive organization or accounting facilities; that is true, isn't it?

A. Well, a good many of them render annual reports, so far as that is concerned. Some designate auditors, some not. But manifestly it is not elaborate, and, for that matter, they usually render on a simplified or abbreviated annual report form. In fact, that is the very explanation of why the detail is not greater in this classification. The annual report does not carry the detailed statistics for the smaller lines that they carry for the large steam roads. (1795.)

I think it is true with respect to that traffic westbound, and practically all traffic that they handle, except the lumber, which is in volume, it moves for all intents and purposes to the Southern Pacific junction point as the origin point or the Southern Pacific junction point as the destination point, as far as the rate of a transcontinental haul is concerned. I think in the absence of a filed tariff that the rate over that covers the local haul out on this short line railroad.

The summary on page 36 includes only carload freight. Eastbound and westbound, through the gateways that are designated. There are 37,386 cars involved, 1,093,458 tons. I gave Mr. Newell that tonnage and those cars for him computations, plus the
981 similar traffic which is designated farther on. (1796.) Mr. Newell has a copy of it all.

I give no consideration whatsoever to less than carload traffic, neither eastbound nor westbound. I so stated at the outset.

Of the total tonnage on page 36, 82¼ per cent is forest products, lumber. As to the routes that take it to the destinations I specified in detail on pages preceding page 36, beyond the gateways indicated, I don't have the routing. The rates apply in the main through the Portland gateway and via Ogden. Either way. The rates, as a rule, apply, en route from western Oregon, either north or south bound. (1797.) Without the tariff I can't undertake to enumerate what lines other than the Union Pacific system lines that lumber can move east over originating on the Southern Pacific in western Oregon. As to whether it can move east over any other route through the Portland gateway, I wouldn't say, no. There is a division to the territory. I can't undertake to enumerate the routings, however, offhand.

Exam. ROGERS. I want to know whether different routing beyond Ogden is permitted if the shipment went by Roseville as distinguished from going via Portland?

A. Well, there would be some territory south, perhaps, to which the Southern Pacific would, you might say, control the routing, or would be typical Southern (sic) routing. I haven't concerned myself in this column with the routing beyond the gateways in common. (1798.)

Q. (By Mr. SPENCER.) Well, but you are an experienced rate expert, Mr. Wiggins; and lumber, of course, has been the subject of rate discussions in this territory in hearings for many years. Now, as I understand the inquiry of the examiner, it is whether or not a shipment of lumber moving eastbound through Ogden has any greater delivering trade territory over any greater number of other lines than a shipment moving to the same destinations through Portland. Is that the question?

982

Exam. ROGERS. Well, take two shipments, both going east through Ogden, but one moving south over the Southern Pacific to Roseville, and the other moving north through Portland down to Granger, over the Oregon-Washington Railroad & Navigation Company. Now, whether one shipment, because it went Southern Pacific, Roseville, to Granger, would be different routing permitted beyond than the shipment moving O. W. R. & N. and Portland?

A. I think most of this, this block, might be either. I think that the intermediate block that I have shown here would be that that (1799) would of necessity cling to the southern routing.

Q. But is it your opinion that the routing is the same east of Granger, no matter which way the shipment goes; is that your answer?

A. Well, there is a great diversity of routes. Certainly there are thousands of designated routes in connection with the originating carriers. Now, as to this, it simply embraces more voluminous tariffs and detailed study on the east end than I have undertaken and given in this.

Taking a shipment of lumber from Booth-Kelly's mill at Springfield, near Eugene. It is, as I understand it, the rates apply, joint through rates, to transcontinental territory and the east via Ogden; that is, Roseville to Ogden, on the one hand, and via Portland, say, and the Oregon-Washington Railroad & (1800) Navigation Company and those connections on the other. The same destination territory is embraced in both tariff routings. The shipper, the Booth-Kelly people, I understand, could route that shipment through Portland to any line, or to any destination, east of Granger, irrespective of whether it moved through Roseville and Ogden or whether it moved through Portland.

983

If it is limited to the inter-mountain country there might be some territory intermediate, as I stated, that would be peculiarly or particularly Southern Pacific routing.

Exam. ROGERS. By "inter-mountain territory" you refer to west of what point in that question?

Mr. SPENCER. Well, west of Denver. West of the Rocky Mountains, generally speaking, and east of the Cascades.

A. Well, there would be intermediate territory there that would be logically southern or logically northern via the existing lines, the rates themselves largely dictating to that extent. (1801.)

Take a car of lumber loaded by the Booth-Kelly Lumber Company at Springfield, consigned to Kansas City; the Southern Pacific hauls that to Ogden, which is the end of its line, at that point it is free to either turn it over to the Union Pacific for movement to Kansas City or to the Denver & Rio Grande Western and Missouri Pacific for movement to Kansas City, as I recall.

Comr. McMANAMY. And the Southern Pacific can do that, can turn it over to the Rio Grande Western, without short hauling itself, and the possibility is there that it may do so; but the Union Pacific once it gets that lumber, having its own line to Kansas City, wouldn't give it to anyone?

A. That would be a matter of course. I understand that situation exists with respect to traffic which moves through the Ogden gateway.

984 Comr. McMANAMY. Now, when we get to Granger we have a different situation, because there isn't anybody there to give it to but the Union Pacific—there is no other line. (1802.)

A. That is true, of course, except that the Short Line reaches the Ogden and Salt Lake gateway by its own line. On the example cited, that is my understanding of it. I wasn't making a point of the rates in this study, and for that reason I didn't go into that and make a check of that.

Q. (By Mr. SPENCER.) On that same shipment of lumber going to Kansas City, originating at Springfield from the Booth-Kelly mill, it could move via either the Northern Pacific or Great Northern through Portland to Billings, Montana, could it not, and thence via the Burlington to Kansas City?

A. Well, I am not certain as to that routing.

Q. Did you use this data, pages 1 to 36, in Exhibit 26, as the basis for any computations or estimates farther on in any of your studies that you have introduced, either Exhibit 27 or 28?

A. No, sir; Exhibits 27 and 28 are wholly separate, except as the annual report figures of one or the other of the carriers would naturally embrace total tonnage, but they are not in anywise (1803) related.

On page 37 I have a total in carloads for the 12 months of 48,580 cars. That total is stated exclusive of the Ogden and Portland gateways.

That 48,580 cars, however, *os* one part, Part A—Part B—There would be 37,064 cars under Part A—which would make a total of 85,644. That is greater in volume than the total east and westbound transcontinental business.

Q. Practically double. Well, what relation does that have,
985 if any, to the cross-State line?

A. Well, merely to try to make up, so far as possible, a complete consist of the traffic in western Oregon.

I haven't used it as the basis of any estimates or computations further on in Exhibit 26 or in Exhibit 27 or 28. On the other hand, I have excluded it. (1804.)

I think there are 19 counties in western Oregon. And 16 served by the Southern Pacific. I do not believe Curry County is served by a railroad. I think there would be Clatsop and Columbia Counties not served by the Southern Pacific.

Page 38 of the exhibit reflects the business in western Oregon counties served by the Southern Pacific, that is local to its lines. That includes Klamath County local traffic, also. That would be intra- and inter-county. That would be local to its line. (1805.) It would not include connections it has in that same territory with the short line railroad I refer to. I understand that this is strictly Southern Pacific.

Q. I see. You say, then, if there was something from the connecting line it was taken in by Southern Pacific billing, the Southern Pacific has accounted for it as such.

A. Klamath is included in this. Seventh column. I don't understand that there is any duplication in any of the classes of traffic we have considered to this point.

I classify as bridge traffic, traffic either originating or terminating in Oregon but passing over lines of the Southern Pacific Company in Oregon. That is on pages 39, 40, and 41. That traffic would not be related to the proposed cross-State line except as it might offer desirable routing, shorter routing.

Exam. ROGERS. Why wouldn't that be related to the cross-State line, the same as any other traffic?

986 A. Well, Mr. Rogers, I perhaps should have said that it stands (1806) in exactly the same position as any of these other units. The thought of it is, I was trying to hold up to view these segregated strands embracing the whole, and in that sense the relationship is the same.

Page 39 states it is northbound and southbound commodities. As to how that could be related to the cross-State line, as I stated, it might be desirable to route something over the cross-State line as against the present routing; it would afford a shorter distance to some of the territory designated.

Q. Well, it has been delivered to the Southern Pacific from an originating point indicated in the first column on the table, hasn't it?

A. Delivered or received. Originating at the point in those designated territories, or received at a point in those designated territories, passing through Ogden.

Q. Now, if it originates in Washington and is delivered to the Southern Pacific southbound it wouldn't and couldn't move via the cross-State line, could it?

A. Between Washington and California it would probably move as is shown here.

Q. And if it was received by the Southern Pacific from a point in Idaho to a point in California as it at present (1807) moves it couldn't go any other way than via the Oregon-Washington Railroad & Navigation Company and the Southern Pacific, could it?

A. Well, manifestly the rates apply that way now, but it might be entirely logical to move it across State. That is, the southern Idaho territory at an advantage, or take territories like Minnesota, Wisconsin, other eastern territory, it might move
987–988 through the cross-State at an average. If that traffic originated on a northern line, the Northern Pacific or Great Northern, or Milwaukee, the tendency would be that they would hold it for their own haul and deliver it to the Southern Pacific at Portland.

Q. Now, the carload traffic, the large carload traffic, other than livestock or products of agriculture, originating in Idaho would be in the Camas Prairie country around Lewiston or up in the mining district in the north end of the State, isn't that right?

A. That would be lumber and ore area.

Q. Yes; and that traffic couldn't move via the cross-State line, could it, if you were to use the Southern Pacific as a bridge?

A. Well, some of it might take central Oregon routings. I wouldn't say that it would come onto the cross-State at the (1808) Ontario entrance.

Q. Well, where would it enter? Have you got another entrance than the Ontario entrance?

A. Some of it, I think, might—I have considered for certain areas up north of—in northeastern Oregon, might come that way. Some of it might come onto the Oregon-Washington Railroad & Navigation Company lines in central Oregon at Sherman and go south, which would be merely skirting portions of the cross-State. Some of it inbound to the interior would be logical for routing the cross-State, but those lines not being in existence and there being no rates it would remain to be seen what would be established there.

989 The cross-State line, as petitioned for in this case, is located approximately 5 miles sout0h of Bend. The Oregon-Washington Railroad & Navigation Company operation terminates at Bend from Sherman on the Columbia River.

Q. Well, then, how could any O.-W. R. & N. traffic be delivered to the Southern Pacific through that gateway as a bridge to southern destinations?

A. Well, it may not necessarily route O.-W. R. & N.

Q. Well, you mentioned O.-W. R. & N. (1808.)

A. I mentioned it, but unless they participated in joint rates meeting the rates of the other carriers.

Q. Now, if it originated on the Northern lines and came up the Deschutes Canyon, to California, where would they deliver it to the Southern Pacific?

A. That could be exchanged at the southern terminus of the Northern lines. In the case of the Great Northern that terminus would be Klamath Falls. However, there are connections at Bend.

Q. Well, there isn't any connection at Bend with the Southern Pacific, is there?

A. Well, the line parallels all the way from the river throughout the north and south limits or area of Oregon.

Q. Now, are pages 40 and 41 a detail of page 39?

A. They set up the both-way movement. The movement is consolidated in 39 and it is given in each direction in 40 and 41. Those totals, 39, 40 and 41, are by carloads and not by tons.

Q. Now, by page 42 you return to your transcontinental (1810) movement and analysis, and present it, as I understand it, by
990 commodities and by counties in Western Oregon?

A. That is summarized according to commodity groupings, in which, of course, we lose the destination territory aggregation as carried in the early part of the exhibit. That includes traffic in both directions.

On page 45 is a further development where I use the same commodity grouping and determine the State or territory to or from which the products move. This summary at the bottom there corresponds with the summary at the bottom of page 36 of the exhibit. Page 46 summarizes or consolidates groups 1 to 5. In other words, all other traffic embraced in 45. If you will take together pages 47, 48, and 49, you have the statement of the same transcontinental strand of traffic, but showing more graphically and feathered to a little greater refinement through the gateway designations. That indicates, I maintain, at a glance the origin and destination (1811) territory by commodity groups via the particular gateways. It is summarized in the right hand portion on page 49.

I did make an analysis of page 37, that bridge traffic—I mean by commodities. Page 37 carries commodity consist in the preceding insert pages there. Only as to the Short Line, however, the other figures not being further dealt with in the exhibit.

Q. There is such a large volume of it there, seemingly about 75,000 cars or more. There is a consist on page 37–A for the Short Line——

A. Well, that is true. There is no further segregation of 37. That is virtually deposited in a block.

Page 47 is a consolidation of the commodities and the territory from and to which they move, and (1812) that comprises all
991 commodities in the so-called transcontinental group, by groups.

You will note commodity group 1 to 16, inclusive, for instance, embraces, generally speaking, the products of agriculture. Those are listed and are drawn into a recap, at the foot. Then the right half of the page is given to commodities groups 17 to 28, inclusive, animals and products, and are likewise summarized at the bottom of the page, and so on through the five general groups. This is limited in its scope to the tonnage that is analyzed in the first 36 pages. That is also true with respect to pages 48 and 49. Forest products are segregated from other traffic and treated separately on page 50. Page 50 designates the counties in which these forest products originate, and pages 51 and 52 the destinations to which the same moves—they are accompanying statements, the one being a condensed statement of the origination, and the other contains a state-

ment of distribution or destination. That is speaking, of course, in a sense of eastbound (1813) as controlling. The both-way movement is shown, but I mean the origination and distribution feature of the exhibit as dealing with the Oregon traffic originated for eastbound movement. Page 52 accompanies page 51 as the remaining portion of the distribution. The two pages are occasioned by the listing of the destination territory, as you will note.

Returning a moment to page 50, which was eastbound, 150 carloads of lumber from Multnomah County via Ogden, that is listed for the county as a whole, further detailed designation not being shown. (1814.) The major portion of the mills in Multnomah County are in Portland. I don't know if all Multnomah County mills are in Portland.

992 Q. Well, if those Portland mills ship via Ogden, through Roseville, to the extent reflected on this page 50, Multnomah County mills, how can you expect mills located local on the Southern Pacific, having a much shorter haul to Ogden, to route their lumber via a cross-State line, turning it over to another carrier?

A. Well, they would have open to them a shorter route if they inclined toward the south.

Q. You have got a much shorter route open from Portland, her mills right there at Portland?

A. This is for Multnomah County, as a whole.

Q. Well, Multnomah County.

A. I would not say it was entirely confined to Portland.

Q. All right, Multnomah County. What is the difference in distance to Granger via the O.-W. R. & N. and the Oregon Short Line from Portland as compared with the distance from Portland via Roseville and Ogden to Granger, Wyoming?

A. I can give you that. Well, I make the distance from Portland to Granger via Roseville as 1,464 miles, and from Portland to Granger via O.-W. R. & N., Huntington, Oregon Short Line (1815), as 932 miles. That is a difference of 532 miles, if I figure it correctly.

Q. All right. Now this lumber moves, according to the statement on page 50, from the mills there in Multnomah County eastbound, 6 cars via Portland and 150 cars via Ogden, and the difference in mileage to Granger is five hundred thirty some odd miles. Now they both have the same rating privilege, but the mills are on the Southern Pacific, are they not, as a rule?

A. Yes; this traffic is from points originating on the Southern Pacific lines.

993 Q. Yes; these mills are on the Southern there in Portland, but rates obtain from Portland to these destinations, the same basis of rates, via the O.-W. R. & N. and the Short Line as via the Southern Pacific and its connections at Ogden, but 150 cars of it from Multnomah County moved through Roseville and Ogden as against 6 cars via the O.-W. R. & N. and its connections. Do you know whether the 6 cars moved via the O.-W. R. & N. or the Northern lines?

A. No; I can't tell you.

Q. They might have all moved to destinations on the Northern lines?

A. I can't say.

Q. But the fact is that practically all the lumber manufactured in Multnomah County originating on the Southern Pacific lines moves now, 530 miles farther to Ogden, in preference to taking (1816) the much shorter route of the O.-W. R. & N.?

A. Well, these cars of course embrace forest products as a whole. That is understood; not necessarily lumber alone. The compensations, and the traffic solicitation, whatever goes with holding business to its line, I presume, is reflected in it. I would not undertake to say.

Q. Now with that precedent confronting you, how will this traffic in western Oregon, 82.25 of it being lumber, how do you expect that the mills will route that via the cross-State line when they disregard a difference in distance here of over 500 miles?

A. Well, I think you have to take into consideration all that goes with the origination and holding of traffic, to answer that; all of the compensations that go with the traffic. That is difficult to answer.

Q. Well, there will be the same compensations that go with
994 the traffic after the cross-State line is built that obtain now; isn't that true?

A. I think if you are to give heed to economies and desirability of shorter routes, less expense, shorter time, direct cut to markets that are competitive, I think all of those things would argue in favor of the cross-State routing.

They did not argue as effectively (1817) for the use of the existing railroads as they would by the cross-State line. I think that you are overlooking a world that goes, as I say, with the first grab at the traffic. As to whether the same advantage of the first grab at the traffic will obtain in the cross-State case as obtains now at Portland, as to that originated by the Southern Pacific, it will be expected to exert every influence at the first direction of the traffic. I should say that is pretty effective. That is the difficulty. I could not say what part of the traffic is routed by the shippers. All of those compensations enter into this thing and they are undoubtedly numerous.

Q. (By Mr. SPENCER.) Well, you would not expect any of those 150 cars to go via the cross-State line, would you?

A. I surely would.

Q. From Multnomah County?

A. I certainly would, if they originate on Southern Pacific line, as they do here. Why wouldn't they all go?

Q. Well, if you are going to be governed by economies, the saving would be accomplished by moving them on the present line (1818) of the O.-W. R. & N., isn't that true?

A. No. You would be offering me there a dual line haul, or a two-line origination, you might say, as against a single. This originates on the Southern Pacific. There would be the matter of
995 terminals and the passing of the traffic through the Portland terminals to reach the O.-W. R. & N. Company. That may or may not be a switching operation. There may be a line haul plus the switching operation. As to whether there are much more advantageous conditions at Portland for interchange of traffic, than there will be up at Crescent Lake—it is ordinarily put up to us in the other light, and that is that the expensive Portland terminals ought to be avoided in the interchange of this traffic—keep all traffic out of the congested areas. As to whether the shipper or the consignee concerns himself with that feature, he might.

Q. How are you avoiding the expense of the Portland terminals by diverting the traffic to the Crescent Junction rather than at the Portland Junction?

A. Invariably when depression has existed in the country, I am positive that the analysis has been that of diverting the traffic around the congested centers, diverting it via gateways that are not so congested, to avoid any terminals. (1819.)

Q. There is not any congestion at Portland terminals, and has not been any, has there, for years?

A. Well, they are the expensive terminals involved, as explained to us. It is true, up to a reasonable point of saturation, that the more business they had to handle the less the cost per unit. As to whether I think any saturation point has been reached with any of the carriers in Oregon in the handling of traffic, I would say, yes. Since you mention it, I could not say definitely about that, but we have been of the opinion that the O.-W. R. & N. Company might represent some such congestion. As to whether the O.-W. R. & N. is to-day not handling to exceed between a third and a fourth of the traffic that it has handled as a maximum, I haven't checked
996 the figures recently on that, but I would not think that it would be so small as that. However, it would surely be desirable to route via the cross-State as against the Portland terminals and over the Blue Mountains.

Q. You know, from the financial statements of the O.-W. R. & N. and from knowledge obtained for fifteen or twenty years, don't (1820) you——

A. I know what the annual reports reflect with the State commission; yes.

Q. That it is operating at a heavy deficiency most of the time?

A. Well, that was not true in 1926.

Q. No.

A. I haven't checked the 1927 figures.

Exam. ROGERS. What is the difference in the distance to Granger by the proposed line and by the O.-W.?

A. The point equidistant, as I believe, I stated before, is a few miles north of Salem, in other words, intermediate Salem to Portland, as to whether you go cross-State or go Huntington.

It is 51 or 52 miles from Salem to Portland. As to whether it is 105 miles longer to Granger from Portland via the proposed cross-State line than it is via the O.-W. R. & N., I don't understand that it is that difference. I understand that the point equidistant is, as I stated, north of Salem, to Ontario, which would be the point that you would meet the (1821) O.-W. R. & N., or the O. S. L. main-line traffic. From Portland to Eugene it is 123.7 miles. From Eugene to Crescent, 95.5 miles. From Crescent to Crane, 185—185 or 9. From Crane to Ontario, 127. That would be from Portland 412 miles as against 535 or 536. The total, then, from Portland to
997 Ontario, via the present line, is 432 miles as against 536 miles via the proposed cross-State line; that is a difference of 104 miles in favor of Portland—I believe that is correct. As to whether on a haul of that length, I think that there would be any inducement for the shipper or consignee to move that via the cross-State line instead of via the present route of the O.-W. R. & N., I think it would. I would still feel that the way under the circumstances, (1822) might be much clearer for the traffic. As to why the shipper or consignee would route that via the cross-State line instead of the O.-W. R. & N. and its connections, I think that he would avoid, as I say, the unknown quantity of terminal handlings at Portland; he would avoid what he might or might not feel would be congestion or difficulties in the Blue Mountains of the O.-W. R. & N.; he would probably reason that time would be a factor in his favor; and there might be other compensations. I can't say where he would get any quicker time than he would have via the present O.-W. R. & N. line; the cross-State line not being in operation. I say what I believe he would find.

Now going down here to Tillamook County, there are big milling operations; there are large milling operations on the Tillamook branch of the Southern Pacific, and it produces eastbound, by this page 50, 241 cars (1823) that move via Ogden eastbound and only 95 cars through the Portland gateway. I do not know, without going back to the detail statements as to destination how many of those 95 cars move into Minnesota, the Dakotas, Montana, or destinations on the northern lines. The detail will show that; that detail is in my exhibit; showing the destination States. As to whether I think that would be routed the same way that the Portland traffic would
998 be routed, I would think, in the main, that substantial similar compensations would accrue to that through the cross-State.

Washington County joins Multomah and produces a lot of lumber. As to whether the lines serving Washington County come right in there to Multnomah County, they skirt it. (1824.) But they would go out the same way, via the same junction as the Tilla-

mook traffic; they could go the same. I have 543 cars from Washington County that are routed via Ogden and 228 cars via Portland. As to whether all of this traffic from Washington County could move a very much shorter distance if it went through Portland, it would be shorter certainly than the Roseville routing. In fact, I think the Roseville routing is a wholly abnormal routing for it. It would be something shorter than the cross-State line, but with the same objections as stated to routing it that way—the terminal situations at Portland and other difficulties.

Q. What are the other difficulties? You have got a more serious mountain to climb east of Eugene than you have over in the Blue Mountains by the O.-W. R. & N., haven't you?

A. No; I don't understand, in a way that that new Natron cut-off has been held up to us in the compensations that it would be so. I think it would be a desirable route for that direct east and west line. (1825.)

Exam. ROGERS. Mr. Wiggins, in this Portland traffic originating on the Southern Pacific is there a switching charge by the Southern Pacific or the O.-W.?

A. There would be switching, which I understand—well, it might or might not be absorbed. There would be switching service.

999 Exam ROGERS. Do you know whether that switching charge is absorbed by the O.-W.?

A. It would be—I understand that that would be absorbed—well, I can't say offhand as to the tariff. I haven't checked it up recently.

Mr. DEY. Why, don't you know, Mr. Wiggins, having been in this traffic game as long as you have been in it in this territory, that the coast group rates apply, no matter what gateway you use?

A. I do, Mr. Dey, but——

Mr. DEY. And there is no switching charge? Isn't that a fact, and don't you know it is a fact?

A. To this extent: Wherever the traffic is competitive in character. In Oregon we expect to see the switching charge, but that might not necessarily hold true as to all of this, and where it might not be so the general rule is, as everybody knows, it is common knowledge, to not absorb it. Wherever it is truly competitive and open to equal solicitation we expect it, and that is the prevailing rule. (1826.)

Mr. DEY. We are talking about transcontinental traffic.

Mr. SPENCER. Colorado and east.

Mr. DEY. Colorado and east; and isn't it true that the rate applies, the same rate applies, on a car of lumber originating in Washington County or Tillamook County or Multnomah County, going through either the Portland gateway or the Roseville gateway, and the shipper pays exactly the same money, doesn't he?

Exam ROGERS. What does the Southern Pacific get for its switching from the originating point to the O.-W.?

Mr. DEY. They get a division of the rate.

1000 Mr. SPENCER. That is right, isn't it?

A. Why, that is right as to your statement with respect to the through transcontinental rate.

Mr. DEY. Well, that is what we are talking about, is transcontinental traffic; that is the traffic that you expect to support your cross-State line, isn't it?

A. That is a part. That is one block of it; yes, sir.

Mr. DEY. Yes.

A. But you are lumping in one sum a similar situation of all mills, which I maintain may not be true.

Q. (By Mr. SPENCER.) Well, your analysis here on page 50 obtains to transcontinental traffic?

A. This is the transcontinental strand.

Q. Transcontinental lumber? (1827.)

A. Yes, sir.

Q. And transcontinental lumber enjoys the same rate from all points of origin from the western Pacific coast group, doesn't it, to transcontinental destination?

A. Generally speaking, I should say that it is the same.

Q. There is no exception, is there?

A. Yes; there would be—there might be exceptions to it.

Q. Is there any on the Southern Pacific Oregon lines? You are analyzing Southern Pacific traffic here originating on the Southern Pacific rails, and is there any exception?

A. Well, I don't recall, offhand. I have not checked that. But I would not necessarily expect but what those very obstacles might exercise some influence in this heavy routing that way.

The rate to Chicago from this Pacific coast group on lumber is 72¢, I believe. It applies from Pacific coast points, generally speaking, Pacific coast common points to Chicago. Traffic 1001 originating on the Southern Pacific can be routed either north or south, as I have stated, via the Union Pacific or Southern Pacific, and probably the Northern (1828) would come in wherever they—I don't recall the tariff, would not want to quote it offhand; it is too voluminous.

Exam. ROGERS. Mr. Wiggins, is the answer to this question in your exhibit anywhere: As to how many carloads of traffic destined to points, we will say, between Klamath Falls and Salem, were turned over to the Southern Pacific at Ogden by the Union Pacific during any given year?

A. That is shown by county boundaries. In other words, we have in the exhibit, and it can be computed from the county segregations for pretty nearly any territorial designation that you may wish.

Exam. ROGERS. Is that substantial, or does it amount to anything, or is it negligible in carloads, or do you recall?

Mr. DEY. Where do you refer to the exhibit to find it?

A. Well, I would turn back to the exhibit which reflects all commodities for that. My thought is that the lumber exhibit itself

would not be typical, for the reason that there would not be (1829) heavy lumber movements westbound of course. I have set out on pages 45, 46, and 47—for example, on page 46 I have summarized the total cars east and west—let me see, though. I think we go back just a little bit further. Page 44 is a brief summarization, which will show the westbound to the particular counties via the Ogden gateway. In that instance there are 1,226 carloads of freight coming to the sixteen counties served by the Southern Pacific via the Ogden gateway, westbound movement. That is in the fifth double column to the right, 1,226 carloads westbound received by the Southern Pacific at Ogden.

1002 Q. (By Mr. SPENCER.) And delivered to western Oregon counties?

A. And delivered to the sixteen counties designated in the left-hand margin of the page—

Exam. ROGERS. Does that include territory north of this equi-distant point, Salem, you might say?

A. It would, and certain counties would have to be eliminated. But, as I say, by county designation, territorial designation, is the smallest unit that I can give that.

The two counties there receiving the largest number of cars west are, first; Multnomah County, 168 cars. As to whether they would move via the cross-State line (1830), I think it would. As to whether I think that it would go into Multnomah County coming westbound, to industries located on Southern Pacific tracks, I think it would; I think it would be logical for movement via the most direct route there. I would not consider the present O.-W. R. & N. line to be the most direct route for the reasons or objections that I have mentioned.

Q. Well, it has got to be delivered to the terminal, hasn't it, whether it comes via the cross-State line or via the Columbia River route?

A. No, not necessarily. This is to Multnomah County as a whole.

Q. Well, what advantage is there in Portland of making delivery of that car from the fact that it comes via the cross-State route instead of the Columbia River route?

A. Well, assuming that your car reaches its destination on Southern Pacific tracks in Multnomah County, I don't understand why it is not logical and wholly reasonable that it should come through what I would consider the clearest route for it to move.

1003 Exam. ROGERS. Do you think the terminal saving would be sufficient to overbalance the extra 104 miles?

A. I would, your honor, coupled with the advantages of empty (1831) car movement in the reverse direction, and that sort of thing. I think those compensations would be considerable. I could not say exactly, but I would consider them substantial.

Q. (By Mr. SPENCER.) You would not haul those empties over a longer line, would you?

A. I would think that the cross-State would be ideal for that empty movement to western Oregon as a whole.

Q. You think if the Union Pacific wants to get some empties into Portland, Oregon, by the O.-W. R. & N., or the Oregon Short Line, that it would have the Southern Pacific haul them in part of the distance and pay wheelage on them, do you?

A. I think that there would be compensations; in fact, I think that those compensations have probably been pointed out by a previous witness, Mr. Newell, that would warrant the movement that way.

Now, the next important destination county in that column is Klamath, that is 129 cars. It should be understood in these numbers that we are using, however, that both the 168 and the 129 should be doubled. You see they are doubled in the totals only. (1832.) Therefore these quantities as set out individually are all to be doubled. But the relationship is the same. 129 cars for six months there, and you double it for the year; and you double the 169. Surely at present I should consider it logical to move that traffic via the cross-State line. What I mean by that is, surely the Roseville routing would have no claim to it as against the
1004 proposed cross-State routing. If the proposed Alturas line were constructed that would give whatever of claim might be to that routing. As to whether the Alturas line would pretty effectively take it away from the cross-State line, well, I am not prepared to say what the difference would be there.

Returning again to this page 50, where 150 lumber cars moving from Multnomah County via Ogden are referred to (1833), that should be doubled. Practically in every instance throughout the report that is true, when you are dealing with other figures than totals. Tillamook 473, of course, should be the same way.

On page 51 is a large volume of business moving to Minnesota via the Portland gateway. My analysis here is dealing with the same cars we have been talking about as handled through the Portland gateway, that is, the forest products portion. As to whether I think the O.-W. R. & N. handles any of that business to Minnesota destinations, I don't know the routing of that. I do know that the Northern Pacific and the Great Northern have through rates, and they serve this territory; and they are the delivering line to Minnesota. The O.-W. R. & N. and Union Pacific have no connection up in there—I would think this would be largely Northern line connection traffic.

Q. So that there are 1,438 cars right in that one item that there is not any prospect of going either via the Columbia (1834) River route or the cross-State line; isn't that right?

A. Well, I don't know what the determining factors in the routing of that were.

Then there is North and South Dakota; they are also served by the Northern lines.

1005 Q. That is shown on page 52. On page 53 do you have local business in this analysis as well as through business?

Take logs, for instance; you have got logs from Douglas County; do they move logs eastbound to Colorado?

A. I have noticed that occasionally there might be a slip of a column there in the classification, but the thought of segregating the lumber products was the controlling one in compiling this and it can be verified by other sections of the report. I believe the item you mentioned as a matter of fact is ties.

I did not intend to put any local traffic in here at all on page 53, 54, or 55; in fact this segregation carries on to and including page 67. It was not the intention to put any local in that and I don't believe it is. I believe, as I say, any apparent discrepancy of that kind is probably due to a shifting of the commodity column (1835), commodity entry, on the left. As is apparent it was extremely difficult to follow those four lines all the way across the page. I was discussing this and I mentioned page 67 as the last page on that particular analysis; there is no summary of that. It is really of minor importance, I take it. I merely compiled it for convenience and, as I say, it is covered by a preceding check.

Now on page 68 I have made a summary of forest products moving east and westbound to and from all counties served by the Southern Pacific, 16 counties in western Oregon, and then a separate statement of Klamath County. I segregated Klamath County owing to the pine lumber. But Klamath County is embraced in the first computation there, 13,593 cars, but excluded in the second and set out separately in the third.

1006 Q. What is the third column on the tabulation of all other commodities which you have, number of carloads, number of tons, (1836) and average tons per car, making a total of all other commodities of 10,200 cars; then you analyze that as to—what is the second analysis, 9,782 cars? Would that be in all the counties except Klamath?

A. The heading at the top governs. 418 cars, Klamath, would be other commodities than forest products from Klamath County. As to what figures I gave Mr. Newell for this page 68, well, I have given him as a matter of fact a copy of the exhibit; I have given him all. But I think, if you care to go forward to page 7, that the individual classes or classifications, or strands of traffic are summarized a little bit more fully.

Exam. ROGERS. Mr. Wiggins, do you know whether Mr. Newell's savings were computed on this traffic from the sixteen counties? What I am getting at is, do Mr. Newell's figures include certain traffic from Multnomah County?

A. I can't speak for his report off hand. I think that it is explanatory as to that. I understand that it embraces substantially the Southern Pacific counties that are named. (1837.)

Now there is a large log movement on the Southern Pacific. As to whether it constitutes a volume in numbers, probably thirty-five to forty per cent of the loaded cars annually, I don't recall off hand what that is. I think there are milling-in-transit rates on that. I

could not say that there are low rates on the logs into milling points; I would not want to pass upon the reasonableness of those rates.

Q. Now as a traffic expert you have got a mill that is not a tidewater mill; you make rates on logs within reason comparatively low, if you can get a good output from the mill of lumber
1007 to haul a long distance transcontinentally, wouldn't you?

A. Well, I could not not answer as to the policy of the road on that. I could not say.

Q. Well, the shipper would attempt to obtain as low a rate as he could, wouldn't he, on his logs in? (1838.)

A. Oh, I would think so.

Exam. ROGERS. They usually do, don't they, Mr. Spencer?

Mr. SPENCER. That has been our observation.

Mr. DEY. On the logs in and the lumber out.

On Exhibit 27 I have the revenue freight carried to Oregon by the large steam roads. That is taken from the annual reports. Those cover the years '22 to '26 inclusive. The significance is, I wanted to give a five-year comparative statement of those tonnages and, as I have already pointed out, indicate the increase over the period. The roads involved are set forth on page 4–a of Exhibit 27. That page lists large and small roads. The 10 roads embraced in the so-called large road statistics are listed on page 4–b. (1839.) Pages 4–a to 4–f, inclusive, are more or less explanatory as to the consist in the recap. In other words, it identifies the commodities, revenue freight originated on the roads named within the State of Oregon and, as is shown on page 4–b, in commodities No. 1 to 16, for example, show that total for the year 1926. Now without encumbering the exhibit for the detail of the remaining features, it likewise lists comparative figures for the years '22, '23, '24, and '25; and it also reflects the percentage that the different traffic groups bear to the total traffic indicated in the right hand column, commodity classifications being used. It goes further, however, on page 4–d, and in addition to indicating the traffic originated by these ten roads in the State of Oregon, it shows all other revenue freight carried
1008 and brings down the total carload and less than carload traffic carried for the same years. It indicates the carriers that carried them collectively only. I may say, however, that the detail of the O.-W. R. & N. lines and the Southern Pacific is shown further on in the exhibit. Page 4 of Exhibit 27 is an analysis of the tonnage (1840) handled by the O.-W. R. & N. System in Oregon, the branch lines, however, being Oregon branch lines, but the figures show at the bottom, for example, the total originated on the O.-W. R. & N., Portland, and likewise the total of all revenue carried within the State.

Starting with the Deschutes branch, column 1, the year 1926, 5,615 cars were forwarded from that branch. According to the statement as shown under the caption intra-system, 488 of those cars reached the Union Pacific Company's rails; the Short Line 210;

the Los Angeles & Salt Lake 53. The others are included in the block of local, 816. Then inter-line eastbound would be 3,511; westbound 537. That 5,615 includes westbound as well as eastbound traffic, also local traffic. (1841.) I understand that, in fact, it includes all the traffic on the Deschutes branch for the year 1926.

Q. And that is true with respect to these other branches you have enumerated, of course?

A. The same compilations, I understand.

Exam. ROGERS. Is there any explanation as to what territory constitutes these various branches?

A. No territory is designated in connection with the branches set forward as itemized there; just the fact that they are Oregon branches.

Exam. ROGERS. There is no showing where they run, from where to where?

A. I haven't designated here the main line junction point and the termini of the branches.

1009 I say there that 5,615 cars were all the cars handled on that Deschutes branch. As to whether those are all the cars forwarded, certainly the portion—the report is divided there in the recap.; it is in three parts, as you notice: Forwarded i none instance. second group is received, and the recap. down (1842) midway of the page there, combines the two.

Q. Of the 5,615 cars forwarded 3,511 cars were forwarded eastbound? No, that is not right.

A. No; that would be the inter-line block only.

Q. Yes, but you say westbound. How could anything move westbound inter-line from the Des Chutes Railroad? Well, it could to the Southern Pacific or the Portland connections; that is what you mean?

A. Yes, sir.

Concerning the letter quoted on page 5–a from the Western Pine Manufacturers' Association, I am not positive who signed that letter or that there was any signature on it, but then I know the statistician of the Western Pine Association who compiled it and wrote the letter, and the man with whom I dealt in securing the figures. (1843.) This is my language down to West Pine Manufacturers' Association, where I say that "Eastern Oregon traffic or traffic generally designated as east of the Cascades and contiguous to proposed cross-State line, is recorded in different sections of this report and accompanying exhibit," but it is in reality an ex'erpt from the report covering western pine tonnage. (1844.)

Q. Well, you make an analysis of lumber from the Bend mills, is that it?

A. Well, further on, in pages 5–C—on page 5–C you will note a partial year check which I took from the records of the mills

1010 located at Bend. That was taken just after the securing of the report from the past in page 5–A.

Q. Now, these shipments on page 5–C, they are all the shipments from the Shevlin-Hixon and Brooks-Stanlon Mills in Bend, I assume, and the destinations of those shipments; is that right?

A. They are what I would call the transcontinental shipments.

Q. Well, you have a got a lot of Oregon shipments and Washington shipments, too, haven't you?

A. Well, I don't know of any locally outside of that. So far as I know, they are the records month by month to the States indicated. I took them first hand, from the statements of the company.

Q. You got them from the Western Pine Manufacturers' Association, didn't you?

A. No, sir; I took them from the records in the office of the Shevlin-Hixon Company at Bend, in the one instance, and in the offices of the Brooks-Stanlon, in the other, but the 35–A is secured through the association, and likewise 5–B.

Q. I notice on 5–A here a letter which you quote, with 10,962 cars. You got those from the Pine Association, didn't you? (1845.)

A. Yes, sir. I simply wanted to supplement that statement with the then most recent figures available up to the date that I took them, which is indicated at the head of the page. I gave Mr. Newell these figures.

As to whether this traffic is a partial traffic, I would contemplate as a resource of the cross-State line, I don't know just fully how he has treated in his report, but I think whatever portion he has used is indicated.

1011 Q. Indicated in his report; but what you had in mind in repairing it was giving it to Mr. Newell?

A. I wanted to show primarily the cars through the Huntington, Oregon gateway, namely, the 3,410 cars shown on page 5–A.

Q. 3,410 cars, and shipments through the Northern gateway, 7,032 cars. Now, what is your idea of showing those cars through the Huntington gateway? What relation does that have to the cross-State line?

A. Well, I have made no further disposition or treatment of these figures.

Q. Do you consider it traffic for the cross-State line?

A. Oh, there might be some of those cars that would be logical for cross-State line movement. In fact, I think there would be. (1846.)

Exam. ROGERS. Did you send these various data over to Mr. Newell and let him figure out what he thought should be considered, or did you determine that in the first place, as to what cars he should take, or shouldn't take?

A. Oh; no, sir; I gave these figures to Mr. Newell in the minutest detail, discussing them with him in every instance, so as to enable him to determine what cars he used, what the traffic was, its origin and destination.

Exam. ROGERS. Well, do you know whether in Mr. Newell's computed saving that he has computed—or, rather, computed savings on Multnomah County shipments, originating?

A. I think the report will show to the extent that that has entered into his calculations.

Exam. ROGERS. Do you know whether he did or not?

A. I believe that he used those.

1012 Comr. MCMANAMY. You are not certain as to what Mr. Newell did?

A. I intended to add, your honor, that I would like to leave to Mr. Newell his own explanation as to the blocks that he has taken, and his reasons therefor.

Mr. SPENCER. Well, Mr. Newell stated, as I recall, that you furnished him the traffic and he applied the rates which you furnished him. Now, you say you discussed it with him in the minutest detail. What purpose did you have in this discussion?

A. To the extent of fully explaining the figures, where they (1847) were secured from and how they were handled, what classification and segregation was made of them, and so forth.

Q. Well, as a traffic man, you were his traffic man, were you not, in the preparation of his exhibit?

A. Well, to correct your statement at the outset, Mr. Spencer, I applied the rates to that block of traffic which is embraced in Exhibit 28. I think that is what Mr. Newell had reference to by way of my giving the rates or the revenues itself to what is embraced in Exhibit 28.

Q. Well, why was it necessary or appropriate for you—what reason did you have for discussing in detail with Mr. Newell this tonnage originating on the Southern Pacific enrouted via the Northern lines to Minnesota, South Dakota, Montana, and various eastern destinations, traffic originating from western Oregon counties closer to Portland than to Crescent Lake? What was the purpose of presenting and discussing that with him?

A. The same as here, to hold up to the view of the commis-
1013 sion these different strands of traffic, so that all might see, it being, so far as I know, the first and only comprehensive count via the gateways involved.

Q. Well, didn't he ask you, and didn't you tell him, in your opinion, what portions of this traffic should be assigned to the cross-State line as a resource for the support of the cross-State line? (1848.)

A. Why, we discussed—that received general discussion and consideration by all concerned, by the commission right along, debated everything in behalf of and against it that we thought worthy of consideration.

Q. Well, have you got any statement here showing what all this traffic you said there should be, or determined should be reckoned with as a resource for the cross-State line?

A. Well, I think Mr. Newell's report is entirely explanatory of the cars that he has taken from here and readily identified the traffic that he—tonnage he has used.

Q. I know, but I am asking you whether you made any analysis of the traffic for the cross-State line.

A. Generally speaking, the block that was of especial consideration is the block I have designated as transcontinental group traffic—transcontinental group territory, embraced in the first thirty-six pages of the exhibit, and summarized at the bottom of page 36, namely, 37,386 cars, 1,093,458 tons. Now, there is additional traffic even, as the short line connections' traffic, which I have set out in detail. That is summarized on page 70, and identified by territorial grouping and classification.

Q. Page 70 to Exhibit 26?

1014 A. Yes, sir. The lower right hand statement to the exhibit, setting out, insofar as possible, the accounting for the traffic as a whole. (1849.)

1015 Q. Did you furnish this information—also furnish this information to Mr. Teutsch and discuss with him the traffic that was available for the cross-State line?

A. No; I didn't give this to Mr. Teutsch, that is, these exhibits. I did give Mr. Teutsch a statement which summarized, I believe, the total traffic of the Southern Pacific for the 16 counties. It was a very, very brief——

Exam. ROGERS. What I was getting at, Mr. Wiggins, when we come to cross-examine Mr. Newell as to why he took certain of this traffic, do you suppose Mr. Newell is going to say that he took it because Mr. Wiggins felt that that is the way it was going to go, or do you think that he is going to use his own judgment about it?

A. I believe that Mr. Newell will support his every usage of this by his own reasons.

Comr. MCMANAMY. Well, if there is any doubt about that, would it not be well to wait until we hear from Mr. Newell and see what his answers are, and then, if necessary, this witness can be recalled for further cross-examination; but I think it might be in the interest of saving time to allow Mr. Newell to answer those questions that relate to his exhibit.

Mr. SPENCER. He said, as I recall, that he got his traffic figures from Mr. Wiggins, and I assume that was the natural source that he would go to get them.

Comr. MCMANAMY. If Mr. Newell doesn't make those matters (1850) clear to you, we will let you have the privilege of recalling Mr. Wiggins.

The WITNESS. On page 5 of Exhibit 27, I have a summary of commercial freight handled by the Oregon-Washington Rail-

1016 road & Navigation Company during the years stated; it is a connecting line statement received by the O.-W. R. & N. Co.

from connections by junctions. That is compiled from a daily report which the Public Service Commission of Oregon receives from the carriers. Here, again, I might direct attention to the exchange via the Huntington gateway first, the years 1924 to 1927 being shown in the lower left-hand portion of the exhibit, and going from 57,453 cars to 68,580 in 1926, and 61,623 in 1927. Those figures are under the word "System lines." And first junction is Huntington, and those figures range to the right. That is the Huntington exchange with the Oregon Short Line Railroad Company by the Oregon-Washington Railroad & Navigation Company (1851) east and westbound totaled, the Oregon-Washington Railroad & Navigation Company being shown in the upper left-hand portion of the page opposite the town Huntington. The short line is shown directly below, opposite the junction Huntington. You are to understand, then, that the Oregon-Washington Railroad & Navigation Company received from the Oregon Short Line in 1927, through the Huntington gateway, 42,276 carloads. And the Oregon Short Line Railroad Company received from the Oregon-Washington Railroad & Navigation Company at Huntington, 61,623 cars, yes, loaded cars only here. The Oregon Short Line Railroad Company received from the Union Pacific Railroad Company at Granger, for illustration, in 1927, 37,676 cars; that is right according to the report. I don't know how many it delivered to the Union Pacific Railroad Company at Granger; that information wasn't shown. (1852.)

Q. Now, at Ogden the Oregon Short Line Railroad Company received from the Southern Pacific Company in 1927, 50,437 cars; is that right—50,435 cars?

A. Well, that is System lines you are reading under now.

1017 Q. Oh, yes.

A. That is divided as between system lines and foreign roads.

Q. Well, the Oregon Short Line wouldn't receive those there; that 50,435 is received by the Union Pacific Railroad Company, isn't it? Is that right?

A. That is as I understand the system.

Q. The Salt Lake interchange—that is between the Oregon Short Line Railroad Company—it received that number of cars from some railroads at Salt Lake; whether it was the Southern Pacific or Los Angeles & Salt Lake or the Denver & Rio Grande or what railroad, this report doesn't undertake to determine or show, does it?

A. It doesn't indicate by name the particular carriers, groups in this——

Q. Well, is that 36,754 received by the Oregon Short Line?

A. Well, that is grouped as system lines, according to your own classification. (1853.)

The heading says here "Oregon Short Line Railroad Company, Carloads of Commercial Freights Received from Connection via

Junction," that is the way it reads. As to whether the Oregon Short Line received any 50,000 cars from anybody at Ogden, I have to take the report for it. As to whether that Salt Lake interchanges with the Oregon Short Line, I have no means of going back of the report, Form No. 1308, which is rendered daily.

Q. Well, this total, grand total, on page 5 of this Exhibit 27 includes 425,141 cars. Now, were those cars handled by the Oregon Short Line? What is that last summary there?

A. Well, that is just a summary by entire divisions. I make no particular point of that there, so far as detail of the figures and
1018 the left-hand half of the page is concerned, but set it in because they were shown in that summarized form in the report. I can't tell you what company handled that. I have got it by divisions, Utah division, Idaho division, and Montana division.

Q. Looking at this same page 5, the Oregon-Washington Railroad & Navigation Company received, as I read your report, from the Southern (1854) Pacific, at east Portland—that is the interchange between the Southern Pacific and the Oregon-Washington Railroad & Navigation Company, is it?

A. I understand, east Portland, yes, sir.

Q. Yes—in 1923, 14,247 cars; is that right?

A. Well, that is foreign roads. Now, I wouldn't say, nor have I any means of knowing, just what road or roads delivered those, unless you would take them off. There is the Portland Electric Power Company, which I style P. E. P., also, delivers at east Portland. I can't say how many cars the P. E. P. Company handle in there in a year; I can't segregate that because the report doesn't.

Anyway, the same carrier, whoever delivers it, whether it is the Southern Pacific or some other road, it shrunk over 4,000 cars from 1923 to 1927—the figures so show.

This page of Exhibit 27 is a statement of cars loaded at stations on the Oregon-Washington Railroad & Navigation Company for the two years 1925 and 1926. (1855.) As to what purpose that serves in this question as to whether the cross-State line should be built, 1-b in the exhibit was the equipment—to show the equipment classification, as much as is shown.

Now, this average traffic, tons, I believe that is the gross of the car loads. They are both, as a matter of fact. The contents are shown similarly in separate columns.

1019 Q. Now, on page 7 you are settiing up the total freight revenue by years from '22 to '26, inclusive, that is, total operating revenues and operating expenses. Now, that is in Oregon alone. Why, when you include in the other statement here all divisions, analyzing the traffic both on pages 5 and 6, when you get to page 7, the financial statement, do you eliminate all the mileage of the Oregon-Washington Railroad & Navigation Company which is in Washington and Idaho?

A. No, I include it in a subsequent page there, page 9—page 9 embraces the system figures. They are segregated, freight and passenger, State and system. Both are shown. (1856.)

As to whether the Washington traffic practically all comes down into Oregon, that is, the eastbound long-haul traffic of the O.-W. R. & N., I haven't checked that up at all, nor have I undertaken to show that in here. These are selected items, as I say, operating statistics, and so forth, according as the captions indicate, and they are rendered on this basis of segregation because the reports so render them.

Exam. ROGERS. Is that a fact, Mr. Spencer, that all the westbound traffic, the largest part of it, destined to Oregon comes around through Washington.

Mr. SPENCER. Well, no; but the Washington traffic, from Puget Sound on the north and eastern Washington territory in the eastern part of the State, the Yakima branch and all of it, comes down onto the main line, through the Huntington gateway, and runs through Oregon, and in that way Oregon gets a division, under your accounting divisions as prescribed by the State Railroad Commissions, that makes the operation very profitable in Oregon, but at a great loss in Washington, isn't that true?

A. Oregon, according to the accounting classification, would receive a mileage pro rate on such traffic as moved over mileages
1020 in Oregon.

Q. I notice on this page 7 of this exhibit that you eliminate (1857) from the revenues and expenses of the railroad the revenue and expenses involved in the operation of the water lines of the O.-W. R. & N. Co. Mr. Newell made the same comment, that it didn't belong in the railroad operation. Do you have any opinion on that? Was this note yours, or——

A. This note is as carried in the annual report, from which the figures were abstracted. It wasn't by way of elimination. It was rather by way of getting up with sufficient detail as to identify it.

As to whether, as a matter of fact, that water line is operated up on the Snake River to take the wheat from Garfield and Asotin Counties in Washington across the river and deliver it to the railroads, I don't know just what that operation is, and I can't say whether it is an additional necessary service, without additional charges to rail.

Pages 8 and 10 relate to passenger (1858) statistics, pages 7 and 9 to freight. That is State and system. According to this, your passenger revenue shows $4,134,000 practically, in 1922, to $3,103,000 in 1926, and the increase seems to be progressing each year. Passenger train miles per mile of road remained almost constant. Referring to the revenue passengers carried, the shrink is approximately 50 per cent between 1922 and 1926. As to whether that indicates that the local business is gone, and that this long-haul business with the revenue keeps up even to the percentage they have,

I haven't analyzed it nor attempted to analyze all that feature, but I assume that that is at least a partial explanation of it. While something might have been said in Mr. Newell's exhibit about
1021 passenger business for this cross-State line, I did not make any estimate for that. While on that subject, however, the passenger business as reflected by the steam roads would be for rail operations, and the same carriers, of course, render reports covering the bus operations which (1859) have been inaugurated during those same years, that is, during the past few years. They render separate reports; the bus operations of the Southern Pacific and the Union Pacific in Oregon are rendered by report. (1860.)

Acting for the Public Service Commission of Oregon, I have been in charge of assembling and preparing the traffic data for this hearing, after the manner explained. I made a request upon the Southern Pacific Company for a statement of its traffic to and from western Oregon which is the basis of the main portion of the figures that I have presented here in Exhibit 26. I did not make a similar request upon any other railroad. We obtained first-hand from the Union Pacific, O.-W. R. & N. lines, statements which I have likewise put in, but not in just the same detail or the same manner. I did make an effort to procure a statement of the traffic handled by the Oregon Electric Railway Company in western Oregon. (1861.) In fact, I might say that we went a little further than that, and I should correct my previous statement to say that we requested similar information of the S. P. & S. Railway and the Oregon Electric and the United Railways, but were unable to get that in time. In other words, it would involve abstracting it first hand and we could not at the time, in view of the date that the hearing was tentatively considered. We did make the request at approximately the same time we made it upon the Southern Pacific—I believe it was a little bit subsequent to that. I might explain that our offer even as to your [Mr. Dey of the Southern Pacific Company] own
1022 lines, as you will recall from the correspondence, was to take the data first hand; that in lieu thereof you volunteered to have the accounts compiled from your auditing office records or auditing department records. That the other carriers we requested similarly, declined to furnish it, that is by their own man power, and offered the alternative of taking the data we estimated the cost at figures that we felt were perhaps prohibitive, both as to time and money. But the auditing department of the Southern Pacific worked for a number of weeks or months preparing this data for us.

As to wether I have any knowledge as to the amount of east and westbound business originating upon and destined to the Oregon (1862) Electric Railway Company in western Oregon, I have some idea of it, but not detail figures because of the fact that their information rendered throughout the years has been on an electric form, as you know, which does not carry the segregation the steam roads furnish.

Q. Well, it is substantial in volume, is it not, handled over the Great Northern and Northern Pacific, which indirectly own the Oregon Electric?

A. Well, there is some volume. I would not say that I think it is so very great, for the reason I don't see how it could possibly be, bearing in mind the line, its character and its charasteristics.

Q. Well, it runs through a large number of principal cities on both the west and east sides of the Willamette River between Portland and Eugene, does it not?

A. It touches places like Albany and Salem and Eugene on down through the valley; and Hillsboro and Forest Grove, small towns to the west; Corvallis, Junction City, and other towns of
1023 that size. As to whether that business moves to and from the East by routes in many instances as circuitous as the Roseville route of the Southern Pacific (1863), I don't know where it all goes, but I had not thought of it as circuitous as the Roseville; certainly not at the start. What I mean is that it could not come farther north than 123 miles before it heads east, for instance, over the S. P. & S. Railway. It is 123.7 miles to Eugene, which is the southern terminus. As to why I haven't figured that traffic in among the traffic that I say should go to the support of the proposed cross-State railroad, believe me, I would if I had it. If I had the traffic so I could lay it out in strands or blocks like this and see it. That is, if I had the actual records to gauge it from. I don't know what that would be or what it would not.

Exam. ROGERS. You would have to turn it over to the Southern Pacific in order to get it to Crescent, wouldn't you?

A. It would have to be turned over to some connection at Eugene. Certainly the Oregon Electric does not go to Crescent. But I understand there is a physical connection between (1864) the Oregon Electric and the Southern Pacific at Salem, Albany, and Eugene. And if circuitous routes are what we want to avoid then I think that traffic should move over the proposed cross-State line if built, if it could be justly handled; that is, if it could be reasonably taken that way from the carrier that originates it.

Respecting the procedure I would adopt as a traffic man to put the business that originates upon the Southern Pacific lines in western Oregon over this cross-State line, if built, that is a traffic matter pure and simple that originates between the carriers
1024 involved, as a rule, and which the public generally, as a rule, does not initiate the arrangements, but I would think that some joint rate arrangement would be the means by which it might be routed that way, if it could be reasonably done; that is, if it could be done with justice to the Southern Pacific Company. As to whether it would take some voluntary action on the part of the carriers, ordinarily the negotiations for arrangements of the kind originate with the carriers involved.

Q. (By Mr. SPENCER.) In this Exhibit 27, on page 11, you have consolidated there, as I understand it (1865), the operations of the four Union Pacific units, the O.-W. R. & N., the Oregon Short Line, the Los Angeles & Salt Lake road and the Union Pacific Railroad Company?

A. Yes, sir; as embraced in the stockholders' report, some 9,647 miles of railroad.

Regarding Exhibit 28, that is headed "Statement showing estimated tonnages and revenues created by proposed cross-State line in Oregon, eastbound traffic." By the term "Created," I mean traffic that would come into existence as a result of the proposed construction.

Q. And it is not in existence now?

A. Traffic additional to what is existent, so far as the west side is concerned.

Q. And traffic that is not in existence now?

A. Yes; that that is not moving at the present time. Not moving by any route anywhere, and not in existence. In other words, from the estimates for the total traffic has been deducted existing traffic. (1866.)

Q. You make a deduction from Exhibit 28 of the existing traffic; is that right?

A. Well, we might have gotten to that phase of the explanation first. This is merely the raking of the tonnage embraced in
1025 the Teutsch report. Explanations as to the manner in which the tonnages originate were made at the time of the introduction of that report. The Teutsch report covered agricultural tonnage, livestock, and so on, that he considered might move by a cross-State line—created by the cross-State line.

Q. Well now, created; did he undertake to show the total tonnage production of these various counties and allocate to the cross-State line a part of that tonnage?

A. After the deduction, so far as the western Oregon traffic embraced herein is concerned, of existing traffic. By the Teutsch report I mean Exhibit 1 in this case.

Now take apples, for instance, I have got five carloads of apples from Eugene as created traffic, going to Chicago. That is fresh apples. (1867.)

Q. Now isn't it a fact that all these Oregon counties north of Josephine are practically going out of the apple business, don't ship to the apple markets of the East, and can't compete with the fine qualities of fruit packed and shipped from Jackson and Josephine Counties in southern Oregon, and from Hood River, the Milton district, the Wenatchee district, the Yakima district, and the like, east of the mountains?

A. Well, I can't say as to that. My line of investigation did not extend to that; in fact, I did not concern myself with the agricultural conditions supporting these tonnages.

Exam. ROGERS. Mr. Wiggins, just as an explanation, who allocated those five cars of apples to Chicago from Eugene? Did you do that or Mr. Teutsch?

A. Mr. Teutsch vouched for the tonnage used as a whole. I took an arbitrary—took apples, for example, and made a division as to the Chicago and New York markets for the purpose of rating,
1026 it being necessary to subdivide the tonnages according to the probable marketing destination, at least a representative one, due to the variation that goes with the rates. So I divided these tonnages as set up here.

Q. (By Mr. SPENCER.) Did you make this same arbitrary division for pears as between Chicago and New York?

A. You have reference to the six and seven cars?

Q. Yes.

A. I did. (1868.) And green prunes, two cars to either, it being understood that Chicago and New York are being used as typical examples only with a view to obtaining average rate per ton-mile to lay against the haul over the proposed cross-State line. I did not allocate any of that revenue that I put on top of this arbitrary tonnage to the Southern Pacific via the Roseville or Alturas gateways. I left all of it to existing carriers except a very small, meagre sum that is claimed in column 16. The Southern Pacific is not going to get all of that revenue except what I have in column 16, but all that might accrue to it as a result of any arrangement that might be made for moving it that way.

I figure the total revenue, for instance, on these first five cars as $2,250. I am going to route them by the cross-State line. (1869.) Then the difference between $2,250 and $188.77 is divided between the Southern Pacific and the Oregon Short Line, the Union Pacific, and the Chicago North Western, if it happened to be routed that way. That is, other than the $188.77 in column 16. That is all I laid claim to there, was $188.77 out of a total of $2,250. Under the present operating conditions I think that business would move through Portland via the O.-W. R. & N. and the short line, Union Pacific, or via the Southern Pacific and the Union Pacific from Ogden.

1027 Q. Yes; and you are in effect taking from the existing railroads that serve the territory and originate the traffic all of the haul, as the case may be, from Eugene to Ontario, if you would proceed over the O.-W. R. & N. and the Columbia River route on the one hand, or from Crescent Lake to Ogden on the other?

A. Well, in the first place I am not taking this from anyone, and in the second instance, it falls into the same lap anyway, so I am merely allocating for that cross-State sector or distance to the proposed construction. That allocation is on a straight mileage (1870) prorate. The Southern Pacific does not also get a mileage prorate; I have attempted to make no division of the remaining revenue.

I have discussed this division on mileage prorate basis with Mr. Newell. It was my suggestion as to the basis that I thought would be proper to use on the cross-State sector, even though I don't think that it properly reflects what the traffic is entitled to, but I considered it as most ultra-conservative and used it for that reason.

Q. And this created tonnage, I assume, is not Mr. Newell's report, in your Exhibit 28?

A. The created tonnages are shown in there, yes; accordingly as set out in column 16. Now, this is limited to transcontinental business on the eastbound. Of course, the westbound statement begins with page 4 and is different points of origin and destination.

Q. I wonder whether you have anything—I suppose all of these traffic items here, that is the tonnage produced, are taken (1871) from the Teutsch report. On page 2 here, for instance, I notice you have several carloads of nuts originating from Eugene, Albany, and Corvallis, going to Chicago and going to New York. There is not any such movement, is there?

A. There might not— I don't know, at the present time. There might not be. But, as I say, it is traffic that is considered——

Q. You planted some orchards in theory, and harvested nuts 1028 from them and sent them to Chicago and New York——

A. Oh, no; I did not.

Q. And collected $7,000 created revenue; is that it?

A. No, sir. These tonnages are supported by the Teutsch report, with explanation therefor.

Exam. ROGERS. Do you know whether there is now a customary movement from this territory to New York, in nuts, Mr. Wiggins?

A. I would assume that there is some eastbound; I don't know to what destination. But the nut industry has been a growing one in the valley and is considered, I believe, as a very likely source of development.

I think it is a fact that the canned goods of the Willamette Valley and western Oregon country in the main, especially to New York, go by water. And yet I have destined to New York (1872) from Eugene, Albany, and these other towns enumerated, some 67 cars of canned goods. I think there certainly would be some. All allowances have been made for existing traffic going as is.

As to where I get 169 cars of eggs out of Eugene, as appears on page 3 of my Exhibit 28, I get those from the Teutsch report, as explained. As to where the Teutsch report says anything about any such egg production at Eugene, Exhibit 1 I believe covers that. I might say, however, if you care to accept my understanding of it, that eggs at the present time are concentrated at Portland, but that it is reasoned with the proposed cross-State line that this assembly would take place at Eugene; that it is logically located with respect to the most likely development, and that it would be the place for cold storage houses, and so forth, for the future movement. That is, to concentrate at Eugene, from the valley. While there may be no

statement indicating that in the Teutsch report, I am sure that the tonnage is supported there.

1029 As to when I calculated that these revenues would be derived, that is, what period would have to elapse (1873)—as indicated in the individual pages of the exhibit, the first, second, third, fourth, and fifth years following construction. That is indicated on the first page, immediately below eastbound traffic, first year. This Exhibit 28 covers not only the first year, but all five; pages 1 to 6, inclusive, deal with the first year, eastbound and westbound. The remaining years are in the short pages following. As to whether this is additional tonnage that will be produced in one year as a result of the inspiration from the cross-State line, it is the tonnage embraced in the Teutsch report for the first year. I could not undertake to go into detail. And this increased tonnage will amount, according to this exhibit, on page 5, to 67,168 tons, and produce a gross revenue of $730,650—that is the total gross computed at the full rate, but the allocation to the cross-State line is $201,431.53, column 16. (1874.)

Q. Now you take the top of page 5 there, and in the Fort Rock district, which is used now for grazing purposes in the winter when moisture is obtained, you are shipping from that district 42 carloads of cattle and you are distributing those shipments equally between San Francisco, Los Angeles, Portland, and Seattle. Now the revenue to the cross-State line as reflected in your column 16 varies a great deal as to which destination you take. By what process of analysis did you take those 42 cars and find out that they were going to be marketed and slaughtered in equal amount and by equal percentage in those four Pacific coast terminals?

A. I took them as to general designation according to the Teutsch report, Exhibit 1, and, for the sake of rating, and in order to show thoroughly representative mileages and not lay claim to too short a mileage, divided it as between those four principal Pacific

1030 coast markets, feeling that those could be said to be typically typical marketing points, both as to distance from point of origin and as to location and probable market. Those are typical as to the Pacific coast, certainly. As to whether there is anything typical about it when I am undertaking to show all the tonnage that is created, or whether it is just simply comprehensive, style it as you may, the tonnage in Exhibit 1 is supported to these points and the fact is that manifestly (1875) there would not be 10½ cars, but I arbitrarily divided as between the four and naturally happened to have a half car, if that is the question.

Q. You did a lot more than that, didn't you? You had, as a matter of fact, from that Fort Rock country, you had 84 cars, but you divided fifty-fifty between a routing cross-trunk junction—I suppose that means a junction with the—with the Great Northern.

A. Yes, sir; I give them half of it to go down through Klamath Falls, and give the other half to the Southern Pacific to go through Crescent Lake.

Q. And you take, for instance, San Francisco, you are going to haul that up the mountain and then down the mountain, and then down over the old Siskiyou route to San Francisco?

A. I don't see anything about the Siskiyou route there. I don't haul it over the Siskiyou Mountains; it does not go that way. I turn it over at Crescent Lake, and it moves down via that new Natron cut-off—the flyer—into San Francisco. (1876.)

Exam. ROGERS. (Referring to the Teutsch Exhibit 1.) Show us, on page 5, where you get the carloads of cattle in the Fort Rock section.

A. Fort Rock would be in the northern part of Lake County. Page 10, third item, 84 cars from northern Lake County, we having to establish the station of Fort Rock, which is in line with the proposed cross-State line.

1031 Exam. ROGERS. But there wasn't anything in the Teutsch exhibit showing where these cattle were to go to? You determined that?

A. Oh, no; this was determined in the full detail of the report, which I had to work from and which I obtained from him (1877) by way of designating the marketing and originating points.

Mr. ELLIS. To make that clear, part of it is in Mr. Teutsch's verbal testimony and it does not appear in the printed exhibit but it was all explained I think in his testimony as to why he figured it would move to the given market.

The WITNESS. No; I called upon him for as nearly specific points of origin and marketing destination as possible, in order to get as accurately as possible at the proper rate, there being none published from a point like Fort Rock.

Q. (By Mr. SPENCER.) Well, did he agree with you that you would just take so many head of cattle and divide them equally between the Great Northern junction and the Crescent Lake junction, and then on the volume that went through each junction you would divide that equally between San Francisco, Los Angeles, Portland, and Seattle?

A. No; we agreed as to the marketing destination and the arbitrary split as between the two junction points I made; likewise the selection of the four points, that is to use the four distances, San Francisco, Los Angeles, Portland, and Seattle, for the sake of obtaining a more representative average ton mile rate. (1878.)

These rates—I took the existing published tariff rates, there being no published rate from a point like Fort Rock, for example, would reach back to Ontario, or if it were going eastbound, why, I take the Eugene rate, applying as maximum to intermediate territory.

1032 On cattle I use the commodity rate in some instances, and the distance scale in some instances for joint or single-line haul, as the case may be; two-line haul in every instance, I believe. There is no distance scale for a two-line haul on cattle. I am speaking now of other commodities in there, as hay and grain.

Q. Well, now, you get down to sheep and hogs, you split them—you give them all to the Great Northern at the junction there, do you not, 352 cars of sheep and hogs?

A. Well, shipments of straight hogs were so allocated. There follows shipments of calves and hogs, which should go via the Crescent Lake routing. (1878–a.)

I don't recall any shipment of hogs from Crane in any direction, but, nevertheless, Crane is merely stated there as a logical point for them to come onto the cross-State line. (1878–b.)

I have been to Crane. As to whether I know as a railroad man there is not a chance for 88 cars, or 8 cars, of hogs from Crane—well, I don't know what there is in that line there at the present time, but this is under the created traffic, even at that. As a railroad man I know where the wool goes in this Northwest country—I have been in these wool hearings.

Q. Now, on page 3 you have got the wool going to—where does that go? Chicago and Boston? Every pound of it comes to Portland, doesn't it?

A. No; I don't know that it does. However, I didn't concern myself with that, either, even though I asked the question just as you have asked it. (1878–c and d.) I would not say that this estimate is incorrect. In this limited quantity I wouldn't say so. It seemed to be the general consensus of opinion that there would be some such amount move by rail, and I understand some cars, but I think that most of the wool will go via Portland. (1878–d.)

I don't know the amount of wool that moves east by rail and by water; I couldn't give you that over any recent or compre-
1033 hensive period, except that it is my understanding that a very large percentage moves through Portland, by water. I took this allocation at the hands of (1879) Mr. Teutsch as in Exhibit 1. I maintain my right to my own view of it regardless, but I didn't quarrel about it. As to whether I knew Mr. Teutsch wasn't a wool shipper or a traffic man, either, I know he is an "agriculturalist" through and through. He is all over this State, and he knows just about what is going on.

Q. Sure—and he convinced you that wool from Bend, forty-nine carloads, would go east to Boston and to New York by rail, is that right?

A. No, sir; I accepted his final determination that there would be that quantity move that way.

Q. And you always agreed with him, did you, as to the routing of these different commodities?

A. I didn't in every instance. I think in most instances that the reasons that he has in support of that are sound. I believe that it is substantially correct, but manifestly there might be some difference of opinion respecting a single commodity.

Q. Now, I notice on top of page 4 here of this exhibit you are taking his opinion that there will be 385 cars of new traffic, con-

sisting of corn to Eugene, the first year that this railroad is in operation. (1880.)

A. I took his report for that 385 cars; yes, sir.

Q. What kind of feed is this here right under the corn? You have got several hundred carloads of feed there.

A. That would be largely grain—that is, wheat, and, I think, barley, and that sort of stuff, grain classification.

Q. You are going to bring that over from Crane and deliver it at Eugene, or at these towns mentioned, is that right?

A. As supported by the report; yes, sir.

1034 Q. A hundred cars of it to Corvallis. What is that, chicken feed or—is that mixed feed, or is that a straight by-product from the manufacture of flour, and so forth?

Comr. McManamy. You can hardly expect this witness to answer that question, can you, Mr. Spencer?

A. I took the report for that. I took the report for it. As a matter of fact, my understanding of it is it is largely chicken and dairy and other feeds, but for all practical purposes I took it as grains and gave it a rating accordingly.

Mr. Spencer. The commissioner asked if you would be expected to know about that. Now, you have been over to Crane several times. There has got to be a mill there, hasn't there, to grind out feed, seven hundred and some odd cars?

A. No, sir; this is listed as feed, but I treated it as grain, and I understand it embraces very largely wheat, barley, and that sort of thing, which it is considered would be raised. I have given it the grain, flour and feed rating, and I don't (1881) see anything wrong with that.

Q. Well, it is wrong with the production—that is what I am getting at—at the originating point.

A. I can't vouch for that feature of the exhibit, Mr. Spencer.

Q. Now, Mr. Wiggins, here you have got some horses and mules that are coming across there from Crane, 36 carloads, divided equally 9 cars to San Francisco, and 9 cars to Los Angeles, 9 cars to Portland, and 9 cars to Seattle. Are those those wild horses that are to be made into canned meat, pickled meat?

A. I will tell you, I didn't ask him what kind or brand. I took them, horses and mules, as stated.

Exam. Rogers. Where does he get the mules?

A. They were in the report, Mr. Examiner.

Exam. Rogers. What I have in mind, as to Harney County I don't see any mules, on pages 5 and 6.

Mr. Spencer. Do you know whether they have—of course,
1035 you determined whether they go to Los Angeles or Portland, but do you know whether they eat any horse meat down at Los Angeles, or pack any down there?

A. I have seen a packing plant down there, but then I don't know about the horses and mules. The agriculturalists vouched for them—I rated them. (1882.)

I would like to say, by way of explanation as to these points that are used, right here, that manifestly I contend it is fairer from the standpoint of the per ton—average rate per ton-mile to average in these distances to San Francisco, to Los Angeles, to Portland and Seattle, than to arbitrarily eliminate or select the shortest mileage. I think that the inclusion of those distances is eminently fair.

Q. Whether the traffic moves or not?

A. Oh, I don't—I had nothing to do with the marketing destination of those, but I am merely explaining the arbitrary split as between the markets, so as to take those distances in there. In other words, if I would take the short distance, the Portland distance, and compute it on that alone I would naturally throw against it a much higher rate per ton-mile, but when I take them in I pull down the average rate per ton-mile, and bearing in mind the marketing centers I think it is eminently fair. As the distance increases the rate per ton-mile decreases, and I am laying that lesser average only to the cross-State section.

As to whether the estimated tonnage and revenue created by proposed cross-State line in Oregon, eastbound, referred to on page 8 of Exhibit 28, is local, this is just as substantiated in the report (1883), Exhibit 1, and the witness rendering same, used for the third year, and was ascertained or figured in the same manner as provided in sheets 1 to 6 for the first year, but is stated here in abbreviated form for convenience in typing and reproducing copies. The 1036 calculations were obtained by the same formula as applied in sheets 1 to 6, inclusive—still based on the Teutsch report. I don't undertake to vouch for the traffic, either in volume or destination; I accept the tonnage allocations as to marketing destinations as supported by the report. (1884.)

To explain the reason for not including an estimate for the second year, that is included in the summary, being the mean of the first and the third.

Redirect examination:

Referring to my first compilation, Exhibit 26, and the (1885) numerous questions asked about my Multnomah County traffic, Tillamook traffic, I individually have not in any of my exhibits attempted to allocate in any way traffic from those counties to the cross-State line, as that traffic is set up in Exhibit 26; I attempted to merely show the traffic by origins and destination.

Exam. ROGERS. Now, did you confer with Mr. Teutsch about it. or give him the benefit of your judgment as a traffic man, as to where it should go, or how it should go—I am referring to the agricultural statement.

A. No, sir; not particularly. I did discuss—have discussed—in fact, it has been discussed up one side and down the other for the very best information and judgment available, and threshed pro and con all the way through, so far as that feature is concerned, but I didn't attempt to substitute my judgment on the marketing destination of this, but I accepted that as his final determination.

Exam. ROGERS. Well, was there any case in which Mr. Teutsch's first views were obtained after conference with you?

A. Well, I don't know to what extent Mr. Teutsch re-worked
1037 or changed any figures. I presume—I don't know as to that,
but I presume that he was continuously after it, and I assume
(1886) that if for any reason there was a reason for changing a figure that it was changed in advance of my using it.

Exam. ROGERS. What I had in mind, Mr. Wiggins, was whether these routings and destinations and split-ups simply reflected Mr. Teutsch's judgment alone, or whether it reflected the combined judgment of yourself and Mr. Teutsch and Mr. Newell and whoever went over it?

A. Well, I think that it is very largely a composite, I should say, as a result of all the pains that could be given to it. That is my—of course, you understand, Mr. Examiner, that you were pointing out Exhibit 26 at the time you were questioning me.

Exam. ROGERS. Well, I meant as to created traffic.

A. As to created traffic; yes, sir. As I stated.

Mr. ELLIS. But as to Exhibit 26, you have not in your subsequent exhibits attempted to apply rates or earnings to any part of that tonnage?

A. No; and likewise Exhibit 28 doesn't embrace any part of it.

Q. Some question was asked about the movement of Klamath Falls tonnage via the cross-State line. Have you in mind the distances to Granger via the cross-State line from Klamath Falls as compared to the distance via Roseville, or have you made any check of those figures?

A. Well, I have—I haven't in mind just the specific, but it is included in the zone that is shorter via the cross-State (1887) line.

Exam. ROGERS. Well, does that have any particular significance to you, Mr. Wiggins, the fact that it is shorter? What I have in mind is what you said about Portland this morning.

1038 A. Only as distance might be a factor. In other words, the
equi-distant point drops, I think, some 20 or 25 miles south into the northern California country out over the cross-State as against the Alturas route—that is, the Roseville routing.

Mr. ELLIS. To clear up a point as to Oregon-Washington Railroad & Navigation Company branch lines in Oregon, could you take your Exhibit No. 27 and describe briefly the territory served by each of those branch lines?

A. Yes; I can do that briefly, I believe. The Des Chutes branch extends from Sherman to Bend, approximately 150 miles.

The Shaniko branch is the next branch line to the east, and extends from Biggs, the main line junction point, to Shaniko, approximately half the distance of the Des Chutes branch. It is in Sherman County. (1888.) From Biggs to Shaniko is 69 miles. The Condon branch is the next to the east, extending from Arlington to Condon, 44 miles. And east of that from the main line at Heppner junction to Heppner is the Heppner branch, 45 miles. All of

these branches I have just enumerated extend in a general southerly direction from a connection with the main line with the Oregon-Washington Railroad & Navigation Company along the Columbia River. They drop off from the river line to the south. The Pilot branch is from Rieth to Pilot Rock—that is near Pendleton— and is approximately 18 miles long.

Then continuing the main line to La Grande is the junction of the Joseph branch, and that extends from La Grande northward through Looking Glass and Wallowa, through Enterprise, to Joseph, in Wallowa County, a distance of approximately 84 miles. (1889.)

That list includes all of the O. W. R. & N. Company branch lines within the State of Oregon—those are the 6 O. W. R. & N. Company's branch lines of O. W. R. & N. Company operation.

1039 There are two other lines, there, I believe, the Homestead and possibly the Brogan, but I believe they are leased to and operated by the Oregon Short Line. All these branches I have listed in my exhibit, except the Joseph branch, extend in a southerly direction from the main line, pointing towards the interior.

Recross-examination:

I don't mean to say that there are not branches from the main line extending up into eastern Washington to the north; there are branches in eastern Washington from the Oregon-Washington Railroad & Navigation Company line that runs to Spokane, or to Marengo.

Q. Well, there is a secondary line from Pendleton up to (1890) Walla Walla, with branch lines—I don't know what is meant by these inquiries about the branch lines in Oregon if there wasn't any in the other direction. You run into the State of Washington when you run up in the other direction, and you find them there, don't you?

A. Well, there is a line that runs northeastwardly from Pendleton to Walla Walla and beyond. Some style it main line, and some style it branch, but I——

Mr. ELLIS. We are willing to stipulate, Mr. Spencer, that eastern Washington is well served with lines of all kinds, so there won't be any question about it.

(Witness excused.)

Mr. ELLIS. The Prineville interveners would like to be heard at this time, and we have agreed to stand aside temporarily. (1891.)

1040 Mr. BECHTELL. If the commissioner please, the city of Prineville, Crook County, and the Prineville Businessmen's Club have filed their petition of intervention, in the main accepting the theory and supporting the theory of a cross-State road, but proposing an alternative route from Burns to Prineville. We expect to put testimony in particularly affecting this road that we propose and the intermediate territory. Testimony has already been submitted by the counties in eastern Oregon and southern Idaho as to traffic

tonnage, which we are willing to accept, and accept that as testimony in behalf of our case, inasmuch as we expect to contend that that will also be served by our proposed route, and it would be only be duplication for us to put such testimony on.

We also understand that the complainant has submitted testimony of a proposed route through the Hogg Pass by the testimony of Mr. Griswold, the engineer, and inasmuch as we expect to use that route, at least to cross the pass to eastern Oregon, but going further north to connect with our route, we are willing to accept that testimony, too, in so far as they join us, if possible, through the Hogg Pass route.

Comr. McMANAMY. That may be done. Proceed.

1041 C. W. WOODRUFF was thereupon called as a witness on behalf of the Prineville intervenors, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Prineville, Oregon. I am manager of the city of Prineville Railroad and have held that position for 4 years. The termini of the city of Prineville Railway are the city of Prineville on the east and Prineville junction on the west, where it connects with the Oregon trunk and the Des Chutes branch of the Oregon-Washington Railroad and Navigation Company. That is a standard gauge railway engaged in the carriage of interstate traffic. For 5 years prior to the time that I became manager of this railway I was resident engineer for the State highway department at Prineville. While I held that position I had charge of the location and construction of the Ochoco Highway from Redmond to Mitchell—that is about 75 miles—with the exception of a small section in the forest reserve; and with the Crooked River Highway, from Prineville to a (1893) point about 10 miles east of Post, which would be about 52 or 53 miles; and then also the market roads in Crook County.

As to the State highway development that has occurred through this particular section of Oregon: There has been constructed the road from Redmond to a point about 10 miles east of Mitchell, on the Ochoco Highway, which is a through highway going east and west across the center of the State. The highway has been built up Crooked River, and almost finished to Paulina, 72 miles. There has been a stub highway built up Bear Creek about 12 miles by the State, and then has been carried on and extended up Bear Creek some 24 or 25 miles by the county. The highway connecting Redmond and through Prineville and Mitchell is part of the Ochoco-McKenzie Highway. It is a national highway east and west

1042 across the State. It connects clear across the State, except for a short gap that is uncompleted east of Mitchell. That is only a matter of completion. It is ordered. I understand it is on the highway system project. (1894.) Between Redmond and Mitchell, I would say over half a million dollars has been spent on

that particular highway. About $400,000 has been spent from Prineville on the Crooked River Highway east.

I am a civil engineer by profession. I am a graduate of the civil-engineering department of Iowa State College, Ames, Iowa. I have continuously practiced my profession. As to my experience in engineering: I worked for some five years in the Middle West for the Burlington Railroad, then I came to Oregon and worked on various logging roads on the west slope of the Cascades in Oregon and Washington, and then after the war I went into central Oregon with the highway department, been there ever since. I have had considerable experience in connection with railway engineering. (1895.) Last week and prior to that time I traversed the territory from Prineville to Burns, and took particular notice of the country with reference to the building of a railroad between those points, but never made an actual survey of it; sort of a reconnoissance.

As to my observations relative to engineering features, topography, and so forth, in connection with the road from Prineville to Burns: There is a very good route going from Prineville connecting with the city of Prineville Railway east up Crooked River to Paulina, and that distance is 72 miles, the Crooked River rising some 800 feet in 72 miles.

Then you take Beaver Creek, a little to the north and still east, on the south fork of Beaver Creek to a place near Howard Valley, at which place you follow the divide into Silver Creek and follow down Silver Creek into Riley, and thence into Burns.

1043 Exam. ROGERS. So that I might understand you a little better (1896), just what is the thought of the interveners, now, as to what ought to be done here. What are you contending for?

Mr. BECHTELL. We propose, instead of a line being built from Crane to Odell, as proposed by the complainant, to take the line from Burns, which connects with the Crane extension to Burns, and carry that through to Prineville, which connects with the city railway, 19 miles in length, which connects with what is known as the Des Chutes Line of the Oregon-Washington Railroad & Navigation Company and the S. P. & S. Railways at Prineville junction, 3 miles north of Redmond.

Exam. ROGERS. And stop there?

Mr. BECHTELL. Well, we stop there, unless it shall develop that it will be possible to continue through to the west over what is known as Hogg Pass to Albany, Oregon.

Exam. ROGERS. The complaint in this case goes from the Point near Crane west to a point on the Southern Pacific.

Mr. BECHTELL. Yes; well, that is true. We attempted to avoid any common user rights by connecting up with the same railway, rather than a rival railway.

Exam. ROGERS. You don't intend to connect with the Southern Pacific, then?

Mr. BECHTELL. No; it isn't possible. I presume it wouldn't be feasible, I wouldn't think. (1897.)

Exam. ROGERS. What was the purpose at the outset in referring to Mr. Griswold's testimony? I think at the start you referred to accepting Mr. Griswold's testimony.

Mr. BECHTELL. Well, with this exception, I believe that his testimony took it to Bend, which is approximately 20 miles farther south. His road could be swung from the town of Sisters, east of the Cascade Mountains. Our connection would be almost directly
1044 east to Sisters. His swings south to Bend.

Exam. ROGERS. What I am trying to get at, what would the commission grant in this case to follow your suggestion, to follow your case?

Mr. BECHTELL. Well, we feel that we can serve the eastern Oregon territory and Idaho from that standpoint with a shorter route to Portland and a very little longer route to California points, and by the extension through to Albany over the Santiam, a connection with the roads in the Willamette Valley can be made in that way.

Exam. ROGERS. Are you going to contend here for a connection right from Prineville to Albany?

Mr. BECHTELL. Yes; ultimately that is the idea.

Exam. ROGERS. Well, are you going to contend that in this case?

Mr. BECHTELL. Yes; that is what we ask in our petition. We
(1898) cover that.

Exam. ROGERS. All right.

Mr. BECHTELL. However, we figure that immediately at least a part of the relief can be obtained by connecting with the Des Chutes line of the Oregon-Washington Railroad & Navigation Company, and if not possible at this time, the ultimate possibility of a connection with Albany.

Exam. ROGERS. Well, you didn't think Mr. Griswold's testimony would be sufficient to justify the extension from Prineville on over to Albany, did you? Did you hear it?

Mr. BECHTELL. I don't know how comprehensive that was. There has also been a prior survey, what is known as the Corvallis and eastern road, that surveyed through there at one time, a number of years ago, but I don't know as to its feasibility. It is gen-
1045 erally presumed to be feasible. I can't say from an engineering standpoint myself.

Mr. MCCULLOCH. Well, Mr. Bechtell, wouldn't Prineville's intervention be satisfied if the commission ordered the construction of a line of railroad from Burns to Prineville?

Mr. BECHTELL. Yes; I might add that that would give us at this time the Great Northern—we have a connection by the extension of the Great Northern from Bend to Chemult, on the Southern Pacific route. I was in error when I said we couldn't connect with the Southern Pacific, but we can through that way; that gives us a Southern Pacific connection by way (1899) of the Great Northern through a connection with the Southern Pacific on the Natron cut-

off. Would you state how, in your opinion, Mr. Woodruff, the purposes of this petition and the providing of adequate railway transportation for these various territories may be served by this proposed Prineville-Burns route?

A. This line of connection from Burns through Prineville to the main line, the two lines in the Deschutes, would then give you a connection south to Klamath Falls and to the Southern Pacific line just the same as if you connected directly. It would be a little longer—it would be from 60 to 75 miles longer from Burns around through Prineville than the other way. I think the distance to Portland from Prineville Junction is a little greater than the distance from Crescent Lake, but it would give this advantage, that anything that originated on the Union Pacific in the eastern part of the State could be handled by them into Portland over their own line.

Comr. McMANAMY. Is that longer or shorter than the Columbia River line?

1046 A. Well, at the present time you go down the Columbia River, and then down the (1900) Deschutes and in.

Comr. McMANAMY. From where you leave the main line at Ontario, how long is the line by way of Prineville as compared with the line over the Blue Mountains and then in?

A. I don't think there would be a great deal of difference.

As to the advantage of going through Prineville: If you are going to build the cross-State line you would develop a country that is now further developed than any other country east and west, anywhere in that section of Oregon, and a country that is capable of greater future development and greater through tonnage than any other route that you can pick across there. If you will look at the map you will see that the forest area in central Oregon lies north of the line there from Prineville to Burns, and that in that area there is much more agricultural development at this time than in any other section that you will take across the State. In the timbered areas you have the watered areas, and that country is now dotted with farms and stock ranches all the way through, and, if you take your line, the topography of the country in there is such that Crooked River is the dividing line between that tonnage and the south; there is a range of hills from the south of Crooked River, between there and the desert, that there are only two points of entry—one is at Prineville, and the other is through Silver Creek, and any (1901) line that is built on the so-called desert, or skirting the so-called desert on the north, wouldn't get this tonnage in the Ochoco district, as it is called, and the line that would be built across there would still leave that country open for a line that would enter by the way of Prineville. The grades are quite easy. You would have as a maximum not to exceed 1½ per cent, and that only for a few miles. I don't know what the maximum grade is on the Columbia River route of the Union Pacific. (1902.) It is my understanding that it is more than that.

1047 Q. How does that territory that you are describing lie relative to the surrounding railways, particularly the Union Pacific system?

A. The map indicates that very well. The branch that comes in from Burns cuts off the territory to the north. The line of the Union Pacific skirts all around that territory. Then they have the branches into it from the north. You have got your Shaniko, Condon, and Heppner branches going in there. And you have an immense territory there in the center that is now not served by any railroad. Take Wheeler and Crook Counties, they are without any railroads at all—a little stub end of a railroad in Crook County, and one in Wheeler, very little in Grant, just on the east side.

Q. Has the building of the Great Northern extension to Klamath been a factor in location of this north and south road over the former original petition, it having been built in the meantime since the original petition was filed?

A. Well, it now gives you a connection from Prineville to the south, to the San Francisco market. It would make a stronger case on that account for the proposed Prineville-Burns line. You can now route it south. (1903.)

The map shows that if you had the completion of a line from Burns to Prineville you would have that northeast quarter of Oregon entirely surrounded and served by the Union Pacific Railroad, especially with the extension of branch lines. Those branch lines of the Union Pacific only touch the outer edge of that territory and do not fully develop the intervening territory.

I just have a knowledge that there is a great deal of land in our country that comes under the Federal Government grant to the Willamette Valley and Cascade Mountain Wagon Road Company, made a great many years ago. (1904.)

1048 (The map so offered and received in evidence, showing the routing of that road grant through central Oregon, was thereupon marked "intervener's Exhibit No. 29, Witness Woodruff.")

This grant was made some time prior to 1870 and was for the purpose of connecting eastern and western Oregon and developing the territory between. This grant was for the purpose of constructing a wagon road, and the terms of the grant were to build a road from Albany to the Harney Valley to the eastern boundary of the State; and there were no strings on to the location in between. These people were to be paid—they were to construct the wagon (1905) road; they were to receive as pay three sections of land, which were to be odd sections, three sections of land for every mile of road constructed.

Now, they had but two things to do: One was to pick a reasonable route for a road, and another one was to get the most valuable land that they could, because in that way they got their pay. And it is noticeable that they started from Albany, went directly over the Santiam Pass, through Prineville, to a point about 13 miles east

up the Ochoco, which took them about to the edge of the timber; then they turned south into Crooked River to skirt the timber on the south, followed up Crooked River until they almost reached the timber, when they swung south through the open country, around what is known as Suplee, then through the timber in the Snow Mountain district, in the Silver Creek Valley, and thence to Burns.

And it is also noticeable that through this district—and this land, I might say, was to be taken in a strip 6 miles on either side of their located lines, and it is noticeable that in this grant, on the map showing the land that they have taken up, that wherever they had any land left, or any land that they could not get, they have gone into this district, and that through almost the entire distance between Prineville and Burns they have taken, not three sections
1049 along each mile, but six, showing that at that time they considered (1906) that the better land along their route, and they have sidered (1906) that the better land along their route, and they have chosen this, if you will notice, with particular reference to getting agricultural land rather than timbered land. The greater proportion that they have taken is agricultural land; that is, land at least other than timbered. The greater part of it that is not agricultural land would be grazing land. There is a vast amount of timber land. The most of their timber land is where they cross the Cascade Mountains. As to how that route compares with the route I have specified here as the possible railway route from Prineville to Burns, it is approximately the same route. (1907.) It is the Oregon Western Colonization Company now. That is the balance that is left. I think the greater part of it has been sold; at least through Crook County. And that is held by individual owners. The bulk of the land along the Ochoco and Crook River that is tillable land, is now under cultivation.

The forest products would be by far the greatest products of traffic that would be available to this Prineville-Burns route, if constructed. You would have the livestock and dairying and agricultural products, and some minerals. That traffic in that particular section would not be available for routes further south located on what is known as the desert. As to whether it would have to find an outlet in other ways, there are just two openings through that country: One is through Silver Creek, at Burns, and the other is down Crooked River through Prineville.

There is planty of water practically all the way from Burns (1908) to Prineville, even for railroad purposes. As to whether it would not be similar to the desert country in the operation of the railroad: That country is well watered.

1050 As to whether I have heard of mineral resources in Crook County, in the Ochoco country: We have two quicksilver mines now that are operating and shipping quicksilver. There is an old gold discovery on the Ochoco which has been mined and worked for, I don't know how many years; a good many years apparently.

They tell about it as far back, I guess, as 30 or 40 years or more. They have shipped some ore out of there. At the present time it is not working. I am quite well acquainted with one of the owners of that particular property, and it is a low-grade ore, which has to have pretty good facilities for shipping to make any money. There seem to be possibilities of mineral resources if transportation is available.

This territory is not adequately served by the railroad which you have, the Prineville Railway, at the present time (1909) because the distances are too great. The city of Prineville Railway now draws from a territory 70 miles or more to the east and to the northeast, but their pricipal products are products that they can bring out on their own feet, cattle, and sheep. There is very little agricultural development. They don't raise grain in there because they can't afford to haul it to the railroad. A railroad only develops a territory within a reasonable distance on either side of it or past its end.

I have heard of the diatomite deposit near lower bridge. That would be very close to where any extension west from Prineville junction would be. In fact, it is very close to the railroad right now. It should be a possible tonnage for a railway. I am sure I don't know where the market would be for that. (1910.) I don't know if it would be probably east. I could not say.

My proposed route would extend easterly from Prineville up Crooked River. It would reach its highest elevation at the head of Silver Creek, somewhere near the Allerson ranger station. It would reach an elevation of about 5,350. The elevation at Prineville is about 2,800. I did not make any estimates of the
1051 cost of construction of a line through that territory. (1911.)

From the head of Silver Creek it is my proposal that the line should follow generally down the course of Silver Creek to Riley, and then would go south of Riley a little and then into Burns. You encounter nothing exceptionally difficult in getting into Burns on that route. There is rather a sharp fall in the topography as you near Burns from the direction that I suggest for a few miles. You would have to support your grade down Silver Creek.

Q. That would require rather heavy construction and fills at that particular point?

A. Yes; that would be heavier construction than where you can follow water grade or the bottom of a stream.

As to whether we would find it necessary to construct many trestles or fills along other parts of our proposed line: You would have to support up on the north side coming out of the South Fork of Beaver Creek, but not so far as you would on the Silver Creek side. At the same time, you would have either a very heavy cut or you would have a short tunnel, and the rest of the line I (1912) don't believe offers any particular obstacles.

As to the type of line I had in mind when I made my observations through that section of the country: I figured a good line. I would say that such a line as I was thinking of would be a better line than either line up the Deschutes Canyon. I could not give any estimate of the cost of construction per mile. Such a line would not be readily accessible from the south on account of the rough broken country south of Crooked River. As to whether that is also true from the north, not to such a large extent. The Crooked River country is all rather rough and broken. My proposal would place the line down in the canyon, in the Crooked River Canyon.

1052 As to what proportion of the (1913) timber tonnage indicated in the green area on the map before me, which is a duplicate of Exhibit 17 in this case, would, in my opinion, be accessible to our proposed line: I would say that you take the timber, that is, from the very beginning of the timber directly north of Prineville, following through this line would go through the Ochoco Forest, and you go through the timber that is on the head of Silver Creek, and I would say that about two-thirds of that timber would be accessible to this line; that is, that would be logged on to this line. Now that would leave out the timber from directly north of Prineville east to the east watershed of Mill Creek.

Mr. BECHTELL. That might help you (passing map to witness).

The WITNESS. No; I have it in my mind; and that timber which would be logged down McKay Creek directly north of Prineville.

Q. (By Mr. ELLIS.) To what extent do you include in your figures the timber adjacent to the line now extending north from Burns to Seneca?

A. Well, the timber naturally divides there at the South Fork of the John Day River.

Q. And to what direction will that on the South Fork of the John Day River go?

A. The timber on the east of it would naturally go into Burns. The timber on the west of it would naturally come into the (1914) Prineville district.

I could not tell you how near that dividing line is to the present terminus of the Sumpter Valley. Of course, you understand, now, there is some timber on the north slope of that watershed that would naturally be logged out to the north, probably by the means of small mills. I don't know how near that dividing line is that I spoke of on the John Day to the present line at Seneca. It lies a consider-

1053 able distance west of Seneca. The line that we propose, in my opinion, would be of no value or service at all to the Fort Rock Valley, or to the area in the vicinity of Alkali Lake.

Q. And the tonnage that you had in mind, that would be served by your proposed line, would be largely timber and agricultural tonnage along the Crooked River and immediately adjacent to your proposed survey?

A. Well, the same answer is true of an east and west line going through the Fort Rock district. That is of no value to us, except that we would want to send something around that way east. They could send something around our way east as well as we could send it around their way east, but on this line of ours you have a timbered and agricultural country practically (1915) the entire distance.

It would not be necessary, in order to serve all of the timber area that I refer to, to construct a logging, or some other type of railroad, generally along the course of the Ochoco Highway. As to whether the timber along the course of the Ochoco Highway would be tributary to our proposed line without additional construction, you have to construct your logging roads into your timber, no matter which way you go in. But this timber could be developed to the south as well as to the east; that is, into Crooked River as well as into the Ochoco; and for the man that owns the timber it would cost him less money, I mean less main line for him to bring his stuff out to Crooked River rather than to bring it out to Ochoco; understanding, of course, that the timber now west of Mill Creek would not log that way at all. There is a large unit that is directly north of Prineville, and that would come into Prineville and would not come in either to the Ochoco or Crooked River; it would come down McKay Creek into Prineville and would be milled at Prineville. After being milled, I presume it would all go east. (1916.) It would go over the new line that we propose.

1054 With reference to this wagon road land grant, I did not testify concerning the extent to which that road was actually constructed.

Q. Do you know anything about whether it was constructed?

A. Why, I know in a general way that a good part of it. It was through our country. I can route it for you.

It generally follows the course of our proposal, with the exception that it goes up the Ochoco about 13 miles and then goes across into Crooked River. I can't say whether there was any substantial construction on that line. That portion through our country is in use to some extent today. It is just a rough forest road. There has been a new road built around through Crooked River, up the Crooked River, that takes the place of that road that they built from the Ochoco across the hills into Crooked River. I don't know whether that was one of the first roads authorized and built in the State of Oregon. It dates some time prior to 1870. The fundamental reason which was back of (1917) that project was none other than to connect eastern and western Oregon.

As to whether these quicksilver mines that I refer to would be served by the proposed route that I suggest: Not any more so than at this time, except that if their product went east then it would be on the east and west line when it was delivered to the carrier. It would be delivered to the carrier at Prineville, and the materials and supplies that they use would be received by them at Prineville,

whether it came from the east or the west. It would merely be served on its ultimate haul from Prineville. That would also be true of the gold mines I referred to.

Q. Did you have in mind any other milling point for your timber than Prineville?

Mr. McCULLOCH. The timber tributary to this line you have advocated?

A. I presume that the Silver Creek timber would be milled at Burns; the other would be milled at Prineville. It might be milled in the timber east of Prineville.

1055 The longest distance that you would get over our proposed line from Burns to Prineville would be (1918) around 160 miles. I believe that could be shortened considerably. In shortening the distance you would not increase the grades. I think your shortening would be particularly done between Prineville and Paulina.

The sawmill at Prineville would bring the logs in from this timber and saw them into lumber and move them back over the line east; that is my idea. That log haul would have to extend about 30 miles out into the timber east of Prineville. They might haul some farther. It might be practical to go farther east and tap the timber rather than to build extensive logging lines. And it would be entirely possible that some of that would be logged farther east than the city of Prineville. When I say "logged," I mean milled.

I cannot say how the cost, in my judgment of getting out the logs and then shipping the manufactured lumber to eastern markets over the line from Burns to Prineville, or from Prineville to Burns, as I advocate, would compare (1919) with the cost of providing that same timbered area that would be tributary to our line with extensions and branch lines of the existing line from Burns to Seneca and with extensions and branches from the existing terminus of the Sumpter Valley Railway. That is something that we have never had the time nor the money to investigate. I believe it is entirely possible to get a line across from the Seneca line into Prineville that would mean considerably less construction, probably would be a very good line, but it takes time and money to investigate that. We feel that this line we have presented is a line of good trade, on which a good line of road can be constructed. I have not made enough investigation to be able to give an opinion as to whether the route that I have advocated here would be the most practicable and the most economical means of getting the logs to a sawmill and sawed lumber to eastern markets.

1056 Q. The timber in southern Grant County and in northern Harney?

A. No; I have not.

It would be somewhere in the neighborhood of 70 miles farther from Crescent to Crane over our proposed route than it would (1920) be over the direct cross-State line. The distance would be 30 miles via our route from Crane to Burns. It is 160 miles across there.

It would be 190, and it is 90 miles to Prineville Junction. It would be about 210 miles to Prineville Junction. Then you would have to figure from there down. That would get you to Crane, or, if you are going to Burns, it would be 30 miles less.

I understand it would be an advantage on that distance via the Crane route where to cross the Great Northern you have to go some 18 miles west to an elevation of 4,700 feet, whereas by the Prineville connection with the Great Northern you would stay 18 miles farther east, at a lower elevation, and have that less distance than that triangle up to Crescent Lake. That would be an advantage to that extent, to the Prineville line. (1921.)

Cross-examination:

I have been operating in that country there for a number of years in highway construction and in timber properties, and in the management of a railroad in there. I know that country fairly well between Burns and Prineville, or Burns and the Cascades.

Q. Is there any line in your opinion that can be sustained to the point of paying its operating expenses across there unless it has timber traffic in large volume?

A. I don't believe it can.

It is correct that if a line were built across the State from the Crane-Burns line to Crescent Lake, that you can't reach it from the timbered areas along in north of Crooked River. The timber in Crook and Harney and Grant Counties, in my judgment, must come out through Prineville, through Silver Creek, or through Silvies Creek as that line now runs north from (1922) Burns; then as you come west from Burns the next opening is Silver Creek, and then you have no other opening to the north.

1057

Q. In what connection did you use Mill Creek? What relation does that have to the problem?

A. Well, the question was if this timber would log—what part of this timber would naturally log onto a line up Crooked River. It would be that timber that is east of Mill Creek. The timber that is west of Mill Creek will come down McKay Creek. The timber on the Mill Creek and the Mill Creek watershed is really a small amount and will probably be cut some day by a small mill and hauled by trucks to the nearest line, wherever that might be. The timber west of Mill Creek would be carried in the log over a logging railroad down McKay Creek. (1923.) There is a little scattered timber on Bear Creek, and then there is the Maurys Mountain forest reserve in there that has, I think, a half or three-quarters of a billion feet in it. The timber that would be available for log haul would be the timber east of Mill Creek, the timber on Mark's Creek, the Upper Ochoco, the Summit Prairie district. That would take you back to the headwaters of Crooked River.

There is no timber on the South Fork of Crooked River.

Q. Now I don't know whether you heard the testimony here or not, but it has been estimated the cross-State line would take timber,

or sheep and cattle, from Crook County, Wheeler County, Grant County, in preference to existing routes. You stated, I believe, that you have cattle feeding into Prineville that you ship out over your Prineville Railroad that come for a distance of 70 miles?

1058 A. Yes, sir; as to how far sheep will drive, some of them are driven further than that.

There are grazing lands in this country largely along this ridge or this mountain, this Crooked River drainage, and so on, east—grazing lands for stock—and from there north. I don't think there is very much resource in the way of grazing lands down on the desert.

This old map, I did not say it was published in 1870; I don't know the date of that map. I said that that grant was established in 1870.

Q. (By Mr. SPENCER.) Well, I notice it designates the center of the State there, and this is not on the other maps, as a Great Sandy Desert. Have you ever been down through there?

A. I have been through part of it. I haven't been all over that district. I think our country is watered a little better than it is down there.

I know only by hearsay whether there have been any sheep or cattle lost out there on that desert. My hearsay on it is that they have lost sheep and cattle on the desert. (1924.)

As to the number of shipments of sheep or cattle we have had to California destinations, central and northern California, since this Great Northern line was extended and open for operation, we had two cars of cattle go to Klamath Falls to graze in transit for San Francisco. No sheep. There is no movement much of sheep or lambs to the West from our country. The ultimate destination, I think, of all the sheep since I have been there in Prineville has been Chicago. Sometimes they go by the Northern lines to feed in transit in the Dakotas or Northern States, but usually to feed in transit in Idaho.

This Great Northern line has been in use since about the first of the year or a little later.

1059 Mr. DEY. Some date in May of this year—two months. (1926.)

The wool goes to Portland. As to the season that we ordinarily ship cattle and sheep, we ship the feeders until along in June and then the grass cattle are just beginning now. By grass cattle I mean cattle that are fed and got fat on grass. April, May, and June would actually be the months for feeder cattle if they were going south to the San Francisco market. They might be fed in the northern part of California. Usually they are fat when they leave our country. I mean the fat cattle that are fed there; the bulk of the cattle that go out of our country are fat cattle. May, June, and July is the last of them. Then the grass fat, the cattle that are fat on grass, begin in the latter part of June or sometime in July.

(1927.) Cattle moving into the Klamath Falls Basin for fattening would move from our section along in May or June. Two cars have moved; that is all. (1928.)

Q. (By Mr. SPENCER.) What is the elevation of the Crooked River Valley as compared to the Great High Desert and the Fort Rock country?

A. I don't know as to Fort Rock, but the Crooked River Valley is, of from 600 or 700 to 1,200 and 1,500 feet below the High Desert. Our elevation at Prineville is about 2,800. You get 4,000 feet after you leave Paulina. It is 3,600 at Paulina, 5,350 at the summit between Silver Creek and the South Fork of Beaver Creek. The snow conditions at the South Fork of Beaver Creek are not bad at all.

I have had some experience in building highways over there (1929) and as to the cost of moving lava rock compared with ordinary
1060 rock, lava rock is the hardest rock you can handle. It doesn't shoot, and it is hard to drill.

We handle a little over 400 cars of cattle and sheep out of Prineville in a year. The cattle, most of it, goes West, and the sheep go East.

Redirect examination:

One reason why there has not been more traffic passing south over the Great Northern Railway is that at the present time the rate is a combination of local rates, which makes a high rate to the South. (1930.) I know of no movement on foot in that country for any revisions of rates over that connection. I know there has been considerable talk about getting a cattle rate, or a livestock rate south, so that in the event they wanted to ship to San Francisco they would have what they consider a reasonable rate. There has also been some question of getting a rate through there on permitting the movement of sheep and cattle to and from the feeding and grazing grounds. That is, at the present time their sheep leave Prineville and go south into the Cascade Mountains and graze, and then come back into Prineville in the fall, and it is getting increasingly difficult to trail those sheep, and those men have been trying to get some kind of a rate that will permit them to ship their sheep down there, for instance, to Klamath Falls or some place north of there, and take them to their grazing allotments in the forests and then come back in the winter, load them and bring them back to Prineville. (1931.) Apparently there is some dissatisfaction with the existing arrangement. (1932.)

1061 Recross-examination:

That should not involve any combination of rates with the Southern Pacific with respect to that livestock; not as far as Klamath Falls. I said Klamath Falls or some point north thereof towards Bend. That would not involve the Southern. Purely a Great Northern haul.

Redirect examination:

As to what extent shippers of our section are interested in moving cattle to northern California points: They never have, of course, shipped any cattle there, because they could not. But I don't know. I have heard that discussed back and forth. Some say they would not care for the California market; others say it would be the thing they want the most. I think that remains to be seen, once a through rate is established. (1932.)

I mentioned an effort being made to get through rates; it is a fact that that was the subject I had in mind, desirable through rates to northern California points. I do not know what the rate situation is now routing via the junction at Klamath Falls, as compared with the present or the old route through Portland.

Q. You would not know whether the rate through Portland for the additional 400 miles is more than the short route or not?

A. As a matter of fact, I had occasion to get some rate a few days ago, I don't recall what it was, and the cheapest rate we could get was via boat to Portland nd then via rail up the Deschutes Canyon. It was cheaper than coming all rail from San Francisco.

1062 W. B. TUCKER was thereupon produced as a witness and on behalf of the Prineville intervenors, having been duly sworn, testified as follows:

Direct examination:

I am agricultural agent for Crook County, headquarters at Prineville. (1933.) I have held that position since February, 1921. Immediately prior to coming to Oregon I was agricultural agent in Ada County, Idaho, from 1917 until February, 1921. My education has been along agricultural lines. I attended the University of Illinois.

With respect to the agricultural resources of Crook County: The approximate area in acres of Crook County is 2,000,000. These figures are taken from the assessor's reports, actually being 1,990,000. Of this amount there are approximately 85,188 acres of tillable land, 735,819 of land that is classified as nontillable, 134,360 acres of timberland, and 107,143 acres of patented agricultural land.

Of this patented land there is approximately 60,000 acres under irrigation at the present time. In addition to that there are several proposed projects, divided into several projects by the U. S. Reclamation Service. This is given in their 1914 report, on page 143, in which it is divided into the west side project of 20,000 acres, principally in Deschutes County; the north unit, of 100,000 acres, which is principally in Jefferson County; the south unit, of 48,000 acres, practically (1934) all in Crook County; the east side unit of 35,000 acres, portions of which are in Deschutes, Jefferson, and Crook Counties; making a total of approximately 203,000 acres that have

been set aside for future irrigation development. That is segregated under Government segregations. Not patented at this time.

1063 This 735,819 acres of nontillable land is used chiefly for grazing purposes. It is very good grazing land on the whole, ample water for the most of it, and furnishes very good grass for the stock that are pastured and run on it.

Q. This Deschutes project, how is that served, or how is that affected by the proposed Prineville-Burns Railway?

A. The proposed road would practically bisect this entire area. In other words, equal agricultural land would be on either side of this proposed road.

Bend is on the extreme south of the agricultural land of central Oregon. Madras is practically on the north side of (1935) this proposed and already developed land.

A large portion of the agricultural land of Crook County is devoted to the production of forage crops, alfalfa being the chief one.

You will notice, those of you who have this report, that there are two estimates. The first column, I should say, is an estimate that I have made from circular letters and personal inquiries among the farmers of the county. The estimate on the second column is a report from the U. S. Bureau of Agricultural Economics, 1926. There is some wide variance between those, which I think I can explain.

The tonnage in Crook County of alfalfa is set at three tons on the average. This figure was arrived at by a forage cost survey conducted by the Oregon Experiment Station in 1926 and '27. There are other hay crops such as wild grass, meadow grass, and tame mixed pastures that are sometimes harvested for hay, as well as rye crops, and some other grain crops, making the total approximately 17,000 acres of hay land producing 2.1 tons per acre.

We have approximately 9,000 acres of spring wheat, yielding about 35 bushels to the acre, 800 acres of winter wheat with

1064 a yield of 20 bushels per acre. (1936.) All of the agricultural land is in the central and western portions of the country—farm land, I should say.

The result arrived at by the U. S. Bureau of Agricultural Economics is not as thorough as the methods which I took, and are probably not as accurate. For example, the way those figures were arrived at was the enlisting of reporters in the county, who periodically send reports to him in Portland, and in many instances there were only two or three such reporters in the county. The potato acreage he lists in 1926 as 250 acres. I can cite two men in Crook County that had an acreage exceeding this total for the county that he has reported.

Beef cattle is the leading livestock industry in the county. The figures giving the number of cattle are shown in this report. A large per cent of beef cattle are fed in the vicinity of Prineville.

They are grazed in the timbered areas that have been mentioned in the previous reports and on this nontillable land. Cattle are fattened and marketed as grass fat and feed-lot fat cattle. (1937.)

The sheep population is estimated on the report, and the bulk of the lamb crop is marketed as feeder lambs—feeder and breeding stock. There are very few feeding operations for feeding and fattening lambs in central Oregon at the present time.

The dairy cattle situation has increased materially in the last 7 years and is still on the increase. We have dairy cattle operating a distance of 70 miles from Prineville, and cream is being shipped by stage to Prineville, paying a charge for trucking it to Prineville equal to that of the freight or the express from Prineville to Portland. In spite of that heavy cost, dairying is still on the increase.

1065 The figures show the amount of butterfat that is produced in the county at the present time. Practically all of the butterfat is marketed in Portland, outside of the local consumption in a few of the surrounding towns.

In my opinion better railroad facilities would help the local situation out, stimulating more dairy development in the Crooked River section, as well as furnishing competitive markets. (1938.)

I have not investigated the California market in reference to central and eastern Oregon, but I would think that it is more a competitive market to stabilize prices rather than an actual market. There would still be a considerable quantity move in other directions in any event.

As to how the products raised in the eastern part of the county, the southern part of Wheeler County and western part of Grant County would be affected by this proposed Prineville-Burns route: It would change the agricultural production considerably, in that there would be more diversified crops produced in that district than are being produced now. It is impossible to haul grain great distances, and if such a railroad were constructed it would be possible to produce those crops that are usually grown tributary to a railroad.

As to my experience with figures and estimates of the United States Bureau of Agricultural Economics in other instances than just these that I cite (1939), I think as a rule they are under rather than overestimates.

I have not made any estimate of the amount of agricultural tonnage that might be expected to move over a line constructed east and west through the State. I am not familiar with the estimate made by Mr. W. L. Teutsch. With reference to Prineville, the area of agricultural land that I say would be changed to produce other

1066 crops than are now being produced is principally east of Prineville, that section not served by a railroad at the present time. That would be mainly along the course of the Crooked River section. As to what kinds of crops or products I think would be produced there in the event of railroad construction: All of the grain

crops that are now being produced in the vicinity of Prineville; that would include wheat, oats, barley and rye. Clover seeds would be produced. Alfalfa is now being produced in that section as a hay crop. These products along the Crooked River there move into Prineville something over 70 miles. (1940.)

Cross-examination:

At the bottom of page 3 of my exhibit I give butterfat produced in 1922 as 47,000 pounds, and in 1927 as 1,050,000 pounds. That is correct as near as I am able to determine. Crook County is estimated to be reflected by those figures. Redmond is in Deschutes County. They raise all this butterfat in the vicinity of Prineville, both north and south and east as far as Paulina. There are approximately 30,000 acres of irrigated land in the watershed of the Crooked River from Prineville to Paulina. The water rights along there have been adjudicated. As to whether that is the capacity of Crooked river, there are no storage rights provided. It is simply direct flow of Crooked River and its tributaries. (1941.) I do not know the capacity of the run-off of that stream for reservoir purposes. The valley is fertile down to Prineville. West of Prineville the cultivated area extends to the county line. As to the inspiration that jumped up that dairy production so rapidly from 1922 to 1927, it was the only thing that was paying good return. I know where
1067 we got our dairy cows from, we imported most of them from the Willamette Valley. We ship our product to Portland, except such as is made by the citizens in those cities and used locally. Some of the product from the Bald Butte section goes to Bend (1924.)

As to whether I am familiar with this desert country that is referred to in paragraph V of the petition of intervention of the Prineville people, I have been through that territory several times.

Q. (By Mr. SPENCER.) It is described in the petition here as a barren waste, with but very scant possibilities of any agricultural development, and without local tonnage. What do (1943) you know about its condition?

A. About the only available use that I know that it is being put to at the present time is a little spring grazing before the water hole drys up.

Mr. SPENCER. I think that is all.

Comr. MCMANAMY. Mr. Tucker, for my information, will you tell me something about agricultural agents—that is, by whom employed, and their duties in general?

A. The agricultural agent is employed by the U. S. Department of Agriculture, the State agriculture college and the county cooperating, each contributing funds toward supporting that work. His duty is to work with all agriculturally inclined people in the county in any way to increase the agricultural condition. There are agents only in those counties which have petitioned for an agent.

(The statement referred to by the witness was thereupon received in evidence, marked "Intervener's Exhibit No. 30, Witness Tucker."

(1944.)

1068 Exam. ROGERS. Mr. Tucker, are you familiar with the proposed location of the cross-State line as proposed by the public service commission?

Q. Only in a general way. I have never followed the route. I have crossed it going north and south, and been along a portion of the way east and west.

Exam. ROGERS. I notice that Mr. Teutsch, in his Exhibit 1, in estimating the present agricultural tonnage available from four counties—that is on page 13 of Exhibit 1—does not include any of several of the commodities that you have on your Exhibit 30. Would you think that any of the commodities which you have shown on your exhibit would be tributary to the cross-State line as proposed by the Oregon commission?

A. I do not. It wouldn't be available for a road that far distant. It moves now over the Deschutes road to Portland.

As to what I think of what Mr. Teutsch has shown there as sheep, sheep for breeding, clover seed, (1945) and wool, my own opinion is that there would be very few sheep from Crook County moving over that road as proposed by the commission. I do not think there would be any more from Deschutes County. Wheeler County would be clearly out of line, no physical connections whatever, and it would be much easier to transport their commodities to the Condon branch of the Union Pacific than go to the south. My judgment as to the clover seed is, clover seed is a concentrated crop, and might be transported in any direction. However, the quantity is so small that it would be insignificant. Respecting wool, the natural movement of wool is to Portland.

Mr. ELLIS. You will recall, Mr. Examiner, that Mr. Teutsch eliminated the wool from that estimate entirely during his testimony.

(1946.)

1069 As to what we do with the 54,000 tons a year of alfalfa, we feed it to sheep and cattle, dairy cattle and feed cattle. Very little of it is shipped from Crook County. We do not sell any of it over in Coos Bay or Tillamook because they won't pay us enough to make a profit on it. We have not reached the alfalfa possibilities there with 54,000 tons; we could double that production and have 54,000 tons for sale if there was a demand for it.

(1947.)

1070 Redirect examination:

The principal market for our sheep is in Idaho and Washington. (1947.) The Idaho market compares fairly favorably with that in Washington. We ship more to Idaho than to Washington. We do not ship any sheep to eastern markets. We ship perhaps one or two cars of lambs a season. They are practically all marketed as feeder lambs. And their market is in Idaho and Washington.

Idaho and Washington produce a lot of sheep of their own, but they buy the central Oregon lambs and feed them out and then ship them on east. On the sheep that are shipped to Idaho, I think they should move east from these counties of Deschutes, Crook, Jefferson, and Wheeler, if it were possible to get them to a railroad without a long drive. They, of course, are going to be loaded on the nearest railroad available.

Q. If they could move from Prineville over the city of Prineville Railway and then through Bend with a shorter distance over the cross-State line than via the Deschutes line and the main line of the Oregon-Washington Railroad and Navigation (1948) Company, is there any reason that you know of why they wouldn't follow the cross-State line?

A. They probably would if that road was constructed to Bend.

V. V. HARPHAM was thereupon called as a witness on behalf of the Prineville intervenors, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Prineville. At present I am supervisor of the Ochoco National Forest. I have been on the Ochoco as supervisor 11
1071 years; since October 15, 1917, to be exact. (1949.) I entered the Forest Service as a fireguard in 1907. I have practically been in the work since 1907 with the exception of about two years, two seasons.

I think I am familiar with the timber resources of Crook County and adjoining counties that come under our jurisdiction. The figures of the forest resources of the Ochoco National Forest, and particularly Crook County, are given on page 4 of this exhibit.

Mr. BECHTELL. Well, on page 4 of your exhibit, Mr. Harpham, the statements 11, 12, 13, 14, and 15, estimating timber in those counties, apply only to timber actually in the forest reserve, does it?

A. That is my understanding. Government timber within the forest. Then in addition to that each of those counties have considerable areas of privately owned timber.

The Forest Service figures that approximately 3,050,000,000 feet could be consistently milled at Prineville coming from the forest proper, and about 2,050,000,000 could also be milled there that would come from adjoining timberlands. Privately owned timberlands contiguous with the forest. That would be approximately 6,000,000,000 feet in all. And Prineville, or the approximate location, would be the logical place for that to be handled. That is governed by the watershed and the lay of the land. The timber easterly from the watershed division line between Ochoco and the north fork of Crooked River could be taken southerly to Crooked River proper if there were railroads (1951) down the river. But it also can be pulled to Prineville by extension of the railroad. That is, it would be either at Prineville or some point on this railway between Prineville and Burns, and not elsewhere.

I am very well acquainted with the country to the south of the Crooked River territory. As to whether I consider it possible that this timber could be moved from a railroad south of the territory of the Crooked River territory: The Government has
1072 never figured it that way. I know, of course, there is a line from Burns to Seneca. I might modify my statement slightly and state that timber from what we call the Snow Mountain division of the forest, that is the unit near Burns, could be taken to any railroad that might pass westerly from Burns. Of course, whether a railroad goes from Burns to Crane directly into Odell or Bend, or whether it would come by way of Prineville to a connection, the route from Burns westerly for 25 or 30 miles would very likely be pretty much the same course (1952), and that Snow Mountain timber could move south to that railroad wherever it might be.

Q. Well, it could move to Burns just as well at present, with the present railroad, could it not, as to a line that came up through it north?

A. A line would have to be built from Burns, of course.

Q. But, for instance, the line from Crane to Odell, would that serve it any better than it might be served now with the present extension to Burns coming down——

A. Well, spur lines, of course, would have to be built from the main line that would extend directly from Crane or Burns to Odell northerly into the Snow Mountain district.

Q. Yes; but I mean across here [indicating on map]. A line from Crane to Odell across here wouldn't help this that you are speaking about?

A. Not without branch lines.

Q. But there is already a line to Burns. Wouldn't that serve better than this would down here?

A. Yes; that line to the south wouldn't help. I have been assuming that a road, no matter where its western terminal might be, would take off from Burns rather than from Crane. (1953.)
1073 Q. Then this extension north into Seneca—that is here [indicating on map]—in order to get this timber in what you call the Snow Mountain territory, which is in here, it couldn't go directly across from Seneca, but you would have to come back in these connecting valleys and then go north again?

A. That is the way the Government figures their railroads, I believe.

This line from Burns to Prineville—this Snow Mountain timber would be more available to it than it would be down the Seneca route.

I am familiar with the privately owned timber. There is a unit of privately owned timber, also, in connection with the Government-owned timber, on what is known as the McKay watershed. That is a desirable milling operation. As to how much timber that contains: We have no detailed estimates, but comparing that with timber that we do have estimates for I should judge that the volume

would be better than two billion. (1954.) And that might be ready for immediate operations if transportation were available and other conditions were favorable.

There is also another unit, privately owned, what is known as the Ochoco timber holdings, that are also ready for development. The Ochoco Timber Company have approximately 50,000 acres, I believe, on the Ochoco watershed outside of the forest boundary. Those figures are approximate, but not very far off. Their other holdings are within the forest boundary. They are in the same unit, though. That would be available for a very immediate operation in case conditions were favorable due to transportation. (1955.)

It is my understanding that the present policy of the Government would be to require milling in Crook County, but not at any designated place within the county. The county would be about as small a unit as they would attempt to define.

1074 "Y. P." signifies yellow pine; "D. F.," Douglas fir; "W. L.," western larch. The other species would consist of white fir, lodgepole pine, and others.

The forest reserves in our jurisdiction are extensively used for grazing.

Those figures of the amounts of livestock in my exhibit are for the calendar year 1927.

With reference to this policy to mill in the county in which is located the timber, as to whether that would mean that that we would have to get some sort of facility into every one of these counties where the timber is located: I can't say whether that policy would apply to every county or not. I understand that the policy of the Forest (1956) Service so far as Crook County is concerned would be to require milling in Crook County. That is unwritten information, but I think it is reliable. The Washington office of the Forest Service have those rulings to pass on. That was handed to me by mouth from a superior officer. I believe, if I may disgress a moment, that that policy so far as Crook County is concerned would be applied in this case, because of past reverses of this particular town. There have been some disasters there that they feel justify that requirement. (1957.)

Those boundaries have changed very little in the forest reserve in the last few years so far as the Ochoco is concerned.

(The map, showing the forest reserve timber and outlining the privately owned timber adjoining, and also giving the watersheds through the forest reserve, showing the Prineville-Crooked River country and that to the north, was thereupon received in evidence marked "Intervener's Exhibit No. 31, Witness Harpham.")

On the map just referred to, marked Exhibit 31, you are correct in understanding that the green portion would move toward the Crooked River watershed and through Prineville.

Q. Is the green portion the 6,000,000,000 feet that you suggested would be tributary to Prineville for milling?

1075 A. That would include the 4,000,000,000 within the forest, and within the boundaries of the purple line. The purple line boundary that I have shown indicates the approximate boundary of the contiguous privately owned timberland that could be consistently logged into Prineville. To include the entire 6,000,000,000 you would include not only the green area but the area within the purple boundary. (1960.)

The Prineville operation—which could not be handled from a Prineville operation, would necessarily have to be handled by small mills, probably, and the timber taken out—it might go some other way. Part of it would not move out through Burns and Seneca. It would have to be either logged down the John Day River, driven down that stream, or some other means of logging devised to care for it. A very small portion of it might be reached by logging railroads which would cross the summit, representing the summit dividing the John Day water shed from the Crooked River water shed. I would not say that none of the red or green area on the easterly end nearer the branch extending north from Burns would be milled at Burns and transported over the Burns-Seneca line.

The Snow Mountain timber with reference to the (1961) colored area on this map is represented by this southernmost unit of the forest. It is south from the most extreme colored portion on Exhibit 31, approximately 7 miles. I stated it as my opinion that the Snow Mountain area would be milled logically at Burns.

In the event the cross-State road suggested by the Prineville interests were not constructed, all of the 6,000,000,000 feet could be handled by a Prineville operation. The longest logging road would need to be approximately 75 miles long to handle that timber into Prineville.

1076 Q. And how long would the longest logging road out of Burns (1962) have to be to reach the timber on the easterly end of the Ochoco Forest not now served by the line from Burns to Seneca?

A. You mean how much of a mileage extension would have to be made to the present Seneca line?

Q. Either from the present Seneca line or from Burns to reach the easterly portion of the Ochoco timber that you haven't included in your estimate as going to Prineville?

A. I don't figure that it would be practical to log any of this Ochoco territory into Burns that is shown as not logical for Prineville.

Mr. ELLIS. Well, the portion that you would log to the south, and that you haven't included in your area as going to Prineville—in your estimate as going to Prineville?

A. It would take approximately 50 miles of logging railroad from Burns to serve the furthermost portion of the Snow Mountain unit. (1963.)

Cross-examination:

I said there were approximately 2,050,000,000 feet in the Snow unit there.

The red line running through the map indicates the summit of the mountain where the ridge breaks.

Q. And on the north side you say, of course, that it isn't practical to haul it over here to Prineville? Now, is there a large area tributary to the John Day on the north side over there?

A. It is comparatively small within the forest. There are several thousand acres of privately owned adjoining it on the north.

1077 Q. And some of these railroads from the other side are headed toward that? Where are the people that are starting their (1964) mill—the Kinsue Lumber Company, about 25 or 30 miles south from the end of the Condon Branch, that are just starting in operation? That is private timber, isn't it?

A. That wouldn't affect this. We figure it wouldn't affect that, because of the deep, rather deep chasm of the John Day River Valley.

Mr. ELLIS. Just a question as to the pink area on the south side of the map, where would that logically move to?

A. That is limited in volume, and would likely be largely used by local people.

It could be logged by trucks on the Bear Creek Road to the Crooked River Highway. Logically it should move to the south or west.

There are approximately 25,000 acres in what is labeled pink in this lower colored diagram. I am having to (1965) guess. That would be perhaps 150,000,000 feet or thereabouts down in that country. That is pretty low—not enough to speak of. (1966.)

PORTLAND, ORE., *Aug. 14, 1928.*

I. M. MILLS was thereupon produced as a witness on behalf of the Prineville intervenors, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Paulina, Crook County, Oregon. I am engaged in the stock business. My lower ranch, that I call my home ranch, is located 12 miles east of Paulina, about 58 miles east of Prineville, on Beaver Creek. (1967.) I would think it was close to 100 miles from Burns.

I have holdings right both in Grant and Harney and Crook County. I would think my home ranch was 25 miles from the Grant County line.

1078 The boys and me, we do our business together—I have two boys, and we have about 20,000 acres. We cultivate part of our land. I have about 500 acres of land that I raise meadow, oats, timothy, red-top, and such forage for stock. Then I raise on both

of my ranches, wheat, oats, and barley, also what potatoes we use, and garden stuff. I could cultivate a great deal more than I do, and I don't cultivate this land year after year. I just raise enough from one year, 2,000 or 3,000 bushels, maybe 4,000 some years, that's all the grain that I have use for, because (1968) we have no market for grain in that part of the county, as we have no transportation, therefore, I don't, maybe, thresh the next year at all, as I have plenty of grain. We raise it practically for our own use. If I had transportation I could raise thousands of bushels of grain more. I have threshed as high as 80 and 90 bushels to the acre there in oats. I have threshed 40 bushels of wheat. There are other stockmen and farmers there that have the same experiences.

I could cultivate a good many thousand acres on my holdings that I just use for grazing purposes, if I had transportation to get this grain out of the country. We can't haul it. Everything that I haul from Prineville costs me a cent a pound by trucking.

I built a house there—I think maybe I completed that in '16, which was rather an expensive house for a ranch house (1969), $16,000 to $20,000. I hauled the material there with a 6-horse team from Redmond. Mr. Lister has built a very modern house there as well, which cost him a great deal of money; I don't know how much.

My holdings and other holdings around me at my other house have been run over several different times in the last 3 or 4 or 5 years by geologists, and this year there was a man in there
1079 representing the Standard Oil Company, having credentials, who has leases on all my holdings at my upper ranch, and several geologists have told me that the lime and lime rock were millions upon millions of tons if we only had some transportation, because they claim it is a cement rock of a first class product. Mr. Conley representing the Standard Oil Company this year was one of those men. (1970.)

Professor Packard, of the University of Oregon, told me there was great possibilities there for cement and lime, millions and millions of tons, and he has told me also, that there wasn't—this lime is just filled with marine fossils; in fact, they had a bunch of boys from the Oregon University there, and I don't know how many hundred pounds or maybe thousand pounds of them fossils that they have taken out of that country, and he told me that that was the only lime in the State of Oregon that there was a fossil in.

Geologists have told me that the marine fossils is also one of the surface indications that have interested oil geologists; but I know nothing about it. We have every surface indication of oil, but what there is underneath I don't know. It never has been prospected.

I am familiar with the country to the south of (1971) me to practically the southern border of the State. I came to Crook County in '85, and have rode that desert for the last 43 years. I am pretty well familiar with all parts of it.

Assuming that a railroad were built from Crane to Odell, as proposed in this proceeding it would be of no benefit to the portion of

the country where I live at all. I would still continue to drive my stock to Prineville, if I were coming west, and I would still
1080 continue to drive my stock to Burns if I was going east. That is about 68 miles in one direction and less than 100 miles in the other; I think we call it 150 miles from Burns to Prineville. My upper ranch is practically half way, and there is where my stock generally originates from when I start on my drive. At my lower place I raise feed, but my upper place when I start my stock to the market they start from the upper (1972) ranch, both sheep and cattle, about 75 miles.

Exam. ROGERS. But how close would a railroad have to come to your place before it would be of benefit to you?

A. Well, of course, I could go if I had a railroad within 25 miles there; I got good water 15 or 20 miles; and I guess if we had a road that I could truck grain, it would be rather expensive. You take where I live our roads there are country roads. After the middle of December unless it freezes up very hard we can't get out.

Exam. ROGERS. Well, what I had in mind, of course, out in this great open country it is practically impossible to build a railroad on everybody's place.

Oh, certainly. (1973.)

The road would be of benefit to me if I can get any distance closer than it is, if I can get the facilities so that I can drive my stock there, now, it would be a benefit if I can't get water I can't go that way.

Q. (By Mr. BECHTELL.) Is not a considerable portion of Grant County that would be served by this road from Burns to Prineville?

A. I would think that everything west of Izee would be served by a road, east and west road, because there would be Izee cattle, a great many of them, if they came west there would ship from Prineville, a great many times, but if they are going east now they are loaded to Bear Valley, over to this other little road; they were loaded there last year.

There isn't much chance for Wheeler County to come in if a
1081 railroad were put through the eastern part of Wheeler County, because they have a mountain to come over there; they would have to go to Prineville.

Q. Do you know of any great amount of local tonnage that would be served on this country that is to be traversed by the (1974) road from Crane to Odell through the High Desert?

A. I wouldn't know where they could get it. I don't know where they can get tonnage across that desert.

There are some little valleys there that would have agriculture, providing they had water to irrigate it, and that is out of the question.

The distance from my ranch to Seneca is 75 miles, over two mountains. It is practical to drive stock in that direction; you can drive stock in any direction, providing you can get water. I have drove to Pendleton for years, I have drove to The Dalles, so it is practical,

but I supposed we would be getting in an age where (1975) we don't have to drive them across the continent.

Q. Well, would you have in mind in figuring the mileage that you would think was reasonably practical in driving stock, so you can get them there in a fat condition?

A. Well, I will tell you, it's just conditions; if you had the conditions—you can't drive them without feed and water. You can go a long way with cattle or sheep if you have feed and water, so they can get plenty of feed and plenty of water.

Cross-examination:

I raise wheat and oats up here. I can raise wheat and oats on both ranches, which I have done. And barley and alfalfa. I irrigate my lower place, and I don't irrigate any of my grain. I irrigate my meadows, but I don't irrigate any of my grain, because I have a sub-
irrigation system that there's quite a lot of my grain subirri-
1082 gated. (1976.) I irrigate my meadows, and of course it don't quite get down into my grain and it subs through underneath. That is what I mean by subirrigated. I raise 40 bushels of wheat to the acre with only this subirrigation. I raise beef for the market. I have just enough dairy cows for my own use. I run one good band of sheep. I run about 1,000 or 1,200 cattle and about 1,550 sheep. (1977.)

As to how far I am from the highway which extends east from Prineville and that goes over to the Canyon City country, I am, from my lower place, I judge it is 68 miles, because Prineville is the closest that I can get. I have never discovered any highway along that ridge that comes out to Paulina there. There is a highway that comes up about to Bear Creek; I would judge it is 20 miles. They call it a highway now, but there was no construction done on it, you understand, and you had better get your life insured before you drive very fast over it. There is a little of everything there. As to whether there are any highways through the big High Desert, I have understood at the present time that they have a highway being built from Burns to Bend, but I haven't been over it—yes, now I will take that back. I shipped a lot of mules to Grand Island, Nebraska, and I came back from Burns to Bend over portions of that highway.

Q. That is not down in the center of the big High Desert? (1978.)

A. Yes, sir. I haven't discovered any roads down there. Now I used to travel a road when I drove stock to California; I used to go by Wagontire: they called it a road. I used to travel it by Albert Lake, down by Chewaucan, the crossing of Chewaucan, up Crooked Creek and down to Lakeview. We can travel any kind of a road in that country; we are used to it. We are not used to traveling highways; we haven't got them.

I did raise a crop of mules. I uses horses, not machinery,
1083 on the farm. When we were ranging over the High Desert we would make a camp one place to-day and another place to-

morrow. We had no headquarters. We worked the country as we went. I know the Christmas Lake Valley, and Fort Rock in the west end of it. As to what I would say of that valley as a prospect for tonnage and crop production, when I rode that country you understand there was (1979) no settlements in there. I can't remember of being in the Fort Rock country since about 20 years ago, and I came through there this last summer, this last spring. In fact, this summer I went down to Lakeview, interested with some of the others in trying to revive the old Oregon Cattlegrowers Association, and I went down through there and the crops looked very poor to me, with the exception of one man had a little piece of alfalfa, and I understood that he was pumping water for it. I didn't stop there. Nothing else looked like a crop to me.

Q. (By Mr. SPENCER.) Well, is it a country that is promising at all as a crop producer?

A. I know the High Desert so well, I have rode it all times in the year, and there is very few times when you get on the High Desert but what you might have a frost, or maybe you might have ice, if you left any water in your buckets, or anything, you might find ice in them. You would not need to have any ice; you could get it right there as a general thing in the morning. That is in the summer months. As to whether that is true in the Christmas Valley, I haven't been in the Christmas Lake Valley to pay any attention to that, just to (1980) be honest about it, but in the High Desert part of it, why, I know it thoroughly.

Q. What effect does water and timber have on climatic conditions? That is to say, you take the same elevation where there is water and vegetation and timber, or it is sheltered, how does that compare with desert open country, where——

1084 A. You can take now, for instance, there is a range of mountains right north of my home ranch as well as east of my upper ranch; we have rainstorms come right around that mountain and never touch the ranch, but the condition is that it keeps up the moisture, the soil has more moisture in it and we will get portions of rain where you don't get any on the desert.

As to what effect on the temperature in an exposed open country where there is no timber and no water as compared with a country of the same elevation where there is timber and water, as to freezing, and crops, it makes a big difference, because, I will give you a little illustration of a gentleman right there up in the edge of the timber, right there at my upper place and my lower place as well. The people that has places there is raising vegetables and things more tender than I can raise away from the timber; right in the edge of it they can raise vegetables and things that I can't raise. As to what the altitude is just (1981) at them places I could not say, but it is just practically the same, because the places that I have reference to are only four miles from my place, but the effect that the timber has on the climatic conditions is the cause. Water has some effect too. My idea is that the exposed desert area suffers much

more from cold and frost and ice than the country where there is timber and water.

In recent years I am not as familiar with the Christmas Lake Valley and Fork Rock; not as much as I am still farther east of there. There has not been any geological change there in central Oregon the last 20 years; none whatever.

I have camped in Christmas Lake Valley. The only difference there that I can see, from what it was 20 years ago, it is fenced
1085 up a little more than it was when I was there. (1982.) The way it was at that time, we would just ride in there one night, you understand, and work cattle and work horses; we would go some place else the next, and it is just the same all over that country; you have ice and you have frost. On my last trip across it I saw some fencing; more so than ever before I went through there this last summer; but there wasn't very much in Christmas Lake Valley this summer. There is some rye grass there, and quite a lot of alkali. That might be tonnage; I don't know. There is some alkali in that valley. There is a whole lot of it in the east end of it. The water is impregnated with alkali; in the east half of that valley. Livestock accustomed to the range don't (1983) take kindly to going up and drinking out of water troughs. They are not used to the watering troughs.

I do not think it is practical to sink wells in a country like the Fort Rock and Christmas Lake Valley and irrigate it and reclaim it with wells, for the simple reason that I have known of two or three wells on the desert in different places, that is wells that have been put down—not exactly they would be on the desert, not on the high. Not on the High Desert, that has went down 300 or 400 feet, and one in particular, Mr. Brennan has one there that he pumps water, or tries to pump water, for a band of sheep, and he has made it a failure, because his machinery gets out of whack, such a hard lift and one thing and another, and it is just simply a failure. That is north of the High Desert, but it is a desert just the same.

Comr. McMANAMY. Where did you get water for your stock when you were ranging them on the High Desert?

A. Now you understand snow comes there in the winter and (1984) there are little lakes, and when the snow melts it fills up those
1086 little lakes and after while when the weather gets hot them lakes dries up. I was trying to think of the lake there; I can't think of it just at the present time, the name of it. That don't generally go dry, but those little lakes, they scatter out on the desert and when they go dry we have to go out there and gather them and take them off of them, excepting the horses. They go a long ways for water.

Redirect examination:

I would include in the High Desert, south of Crooked River, towards Wagontire, towards Alkali Lake, around Alkali Lake, around Abert Lake, west, all through that country towards Bend.

I would not include the area around the Double O Ranch; that is not High Desert. Going west from the Double O Ranch you would strike the High Desert there at Glass Buttes, and a good long ways before you get to Glass Buttes. That is some distance west of the Double O Ranch. (1985.) You can strike a desert any place that you leave the Double O Ranch and go towards the Glass Buttes. You take the Wagontire mountain area, we have some springs on the Wagontire Mountain that runs out a little ways in the desert and sinks. There is one man there that I know of just the other side of Wagontire that has a well, not very far away from Wagontire. There is another one still farther west. Now there might be more, but I don't know of only them two. There is another one also now, but it has very little water; they don't water very many stock, because he runs his stock in the Maury Mountain area, and that is on a road between, about half way between Bend and Burns.

As to how far the well in the Wagontire section is west of the Double O Ranch, I could not tell you the area in miles, but it is a good long ways. The farmers in that area sometimes raise some farm crops in there when we have a very wet season. But
1087 most of them people has left that country; it has been settled up thickly. (1986.) The reason they don't raise them is not that they have no transportation to get them out. They can't raise them in there, because they haven't got the soil, nor they haven't got the moisture. They can't raise them. I can raise them but I don't because I have no transportation. I can raise them, but do. But I don't raise only just exactly what I have use for myself. They would not be limited in the same way that I am. Their soil conditions is altogether different. I have seen farming done in that area down there. I have never done it, thank the Lord.

As to water conditions down around Alkali Lake, I have drove stock from Abert Lake—from Wagontire to Alkali Lake, if I am not greatly mistaken it is 30 miles. There was no water at the time that I drove stock through there from Wagontire to Alkali Lake. (1987.) You can dig a well almost anywhere around Alkali Lake with a post hole digger. You can right around the edge of the lake in about 20 minutes. I don't doubt that at all. But if you had something else besides a post hole digger. You can't go through that lava very well with a post hole digger. As to whether water can be found with 12 or 15 feet anywhere around Alkali Lake, right around Alkali Lake, if the lake don't cover it, I have no doubt but what you can. But after you get away from the edge of the lake you get into lava and you get into rock. You can't do no business with a post hole digger there.

I did not include in the High Desert area that I speak of the territory around Silver Lake and Summer Lake in northern Lake County. Away from Summer Lake it is a desert area. You take right there at Summer Lake, it is a very nice part of Oregon. At Silver Lake they have got a different soil. Everything is different in Silver Lake.

1088 As to whether I know anything about the Fort Rock Valley (1988), I have been through there and I have rode it years ago and I was through there this last year. I have seen men farming there; that is as far as I know about the conditions; and I have seen the crop this year that they were trying to raise. I would include that in my description of High Desert, the farming part of it; not as bad as some of the others. It is really a wee bit better. It freezes quite a lot around the Fort Rock country. Yes, it used to years ago when I used to camp up there. I just came through there this year in an automobile. I don't think the conditions could have changed. I don't see why it would change.

Q. Do you mean to say that the frost conditions there now are such that crops cannot be raised successfully?

A. I think for the crops that is there—I saw all kinds of crops there this year that was frosted, just this year when I came through. The crops was frosted when I came through from Lakeview. (1989.) As to when I came through there, I was just trying to study about the dates. I can't just exactly study. It seems to me as though it was in June. I would not be positive. I saw some crops such as those described by Mr. Nolte in the record; there was one piece of alfalfa I saw. I have an idea you got it out of the same piece. [Referring to samples produced by Mr. Nolte.] That is the only alfalfa I saw in Fort Rock Valley. I have an idea it was just about like that.

I do not know the people that live at the Ernst ranch and the ranch farmed by H. M. Parks. I saw more than one ranch. I went right square through the valley, and I noticed this one piece that the alfalfa was growing in, and I think that must have come off of that ranch.

1089 Q. Mr. Nolte, of Lakeview, has introduced some pictures as exhibits in this record, and I have three of them here; did you see anything that looked like that?

A. Well now, I didn't take no particular notice of that. I was looking and taking in the condition of the (1990) country as it was at the present time when I went through it, and as it was when I used to ride the range. I didn't find anything that was promising in the Fort Rock Valley. I don't know as I found anything that looked like the pictures you are showing me. What do you call them? Are them potatoes? I might have saw some of them potatoes; I might have. What time was that picture taken?

Q. About 10 days ago.

A. Ten days ago. Well, them was very small when I saw them. They might have been frosted two or three times since then and still be that high. (1991.)

In ranging livestock on the High Desert, there was no difficulty at all when we had water; no difficulty when they had water for them to graze on. In the springtime we had water. Them little lakes fills up and we have water for the stock. It is very good; the grass is very good at that time. Winter times there is some sheep and some

horses ranged on that desert, but they haul corn in there. But they don't do that as much as they used to do it.

In raising livestock in this country, or any other country, it is certainly essential to have not only water but a feed supply for winter months available.

Q. And isn't it true that you could utilize even the High Desert to better advantage if you had some means of transportation to get in your feed when the first heavy snow comes?

A. Oh, yes. You can take—if I was on the High Desert and I was trying to skim through, like some of them Basques does,
1090 they don't have a foot, they haven't got a dollar invested in any real estate; they are just trying to accumulate a little—(1992) a lot of Basques and others as well; white men, some of them, in the same class. They can go out there on the desert and if they had transportation to haul some feed in there and let their sheep eat snow as long as they had snow, why, they can get through. They eat snow to take the place of water, and in that way when you would have to feed; but then your stock don't do as well as it would where you had the running water for them, to feed them their hay and had running water for them; not near as good. Even on the worst part of High Desert, or the territory I call a High Desert, there is something there that could be better utilized if they had better transportation facilities. Any portion of the country, I don't care where it is, if you can utilize it at all you can use or utilize it more with transportation than you can without it. Certainly you can.

In that central Oregon section you will find little draws where the sagebrush will get (1993) pretty good size. You will find other areas that the soil is mixed up with fine gravel and things, that the sagebrush is not very high. Not large areas where the sagebrush gets large, not large areas but just small draws, as it is all over central Oregon.

Q. Is the fact that you find large sagebrush an indication of fertile soil?

A. Yes, if you had moisture. Yes, if you have moisture for it. It don't indicate nothing if you haven't got the moisture. If they have water to apply to that soil it will produce.

Q. (By Mr. McCulloch.) Mr. Mills, how far would this line that you are advocating from Burns to Prineville have to be away from your branch there east of Paulina before you would say it would be of any benefit to you?

1091 A. Well, as I have stated before, I am not advocating any railroad line. I am just here for the purpose of explaining the conditions in my immediate neighborhood and the High Desert conditions. (1994.) I am just telling you the condition as it exists in that area. I don't know where the line would be, where it would be located; and, to be honest with you, gentlemen, I don't expect to ever see the railroad up there in my time. I am too old. I am here as a witness in the interest of the construction of a line,

but I don't know where the railroad would run. I am interested in transportation.

Q. How close to your ranch would that transportation have to be, to be of any benefit to you?

A. Any place less than Burns, or any area less than Prineville, providing I have a way of getting to it.

My lower place is about 68 miles from Prineville; and my upper ranch from Burns, it is about 75 miles from Prineville, or to Burns, and there is where my stock originates; and about the same to Prineville, or 80 miles. If a railroad came within 68 or 75 miles of my ranch it would not (1995) be a benefit to it if I can't get to it, because I can go to Burns or I can go to Prineville. I mean when I say if I can't get to it, that there might be conditions where I can't drive my stock to it, maybe, because there is no water or no feed, or some such conditions as that, you understand.

Q. I say, how close would a railroad have to be to your ranch to be of any benefit to you, as conditions are now?

A. At any distance closer than it would be to Prineville or to Burns, providing the condition was so, if it was so located that I could get to it. I can't drive stock over a desert, gentlemen. I could go in the spring of the year, but I don't sell nothing in the spring of the year. My stuff goes out in the fall. (1996.)

1092 Q. Well, if this line of railroad from Burns to Prineville and 68 or 70 miles south of your ranch would that benefit you?

A. No, it wouldn't, because I can go to Prineville or I can go to Burns.

Q. If it ran 50 miles south of your ranch, would it do you any good?

A. If it was conditioned so I can get to it south. It wouldn't be no benefit, because I can't drive my stock to it. It would benefit providing, you understand, it was located so that I can get my stock to it. I have to have water, gentlemen, and I have to have feed. They won't feed on high desert air.

As to whether I could drive my stock south at all from my ranches under present conditions and get water and feed, get them to a railroad, I drive my lambs to Burns every year, but I can't drive feed cattle through that way at this time of year, but I can go, you understand, I can go by making some long drives to get into the Silver Creek meadows, or I can go by way of Izee and go to Burns, through the timber, and get good accommodations. (1997.)

When I used the word "desert" in the phrase "high desert" I mean in a desert where there is no water. I supposed every man in this country knew what a desert was, but I will try and explain it to you. It is where you can't practically raise anything, that is, like grain, and there's no water there, and things of that kind. There might be a little bunch grass, there might be sage, and a devil of a lot of rock. I have in mind the lack of water makes the desert. If

you have plenty of water on what you call this desert there's patches there that will be fertile and sometimes you will raise something on it, and sometimes it will frost, but there's things that you
1093 can raise there that won't frost. (1998.)

I have never been through Utah. I have never been down over the line of railroad running from Ogden to Los Angeles. I have been all over the State of Arizona in my younger days.

Exam. ROGERS. Well, take it down in Arizona, west from Tucson, on the line of the Southern Pacific, is this country down here anything like that country down there?

A. Well, no; it isn't just exactly in that—that kind of a country. The nature of it is a good deal the same, a good deal, yes, but that is a lower country. This is higher in elevation than that country, I would think, not knowing the elevation of that country. I never did know the elevation. I was in there when I was a kid.

We don't have the cactus on the desert, I will say that for the desert, because I think it is too cold for the cactus to grow, might get frosted. (1999.)

Recross-examination:

The Silver Lake area—I don't think the Silver Lake area has a sufficient water supply to irrigate it. Any of that country, gentlemen, will raise something if it is irrigated. There may be something—you may not raise anything very tender; you may make a failure in that country, gentlemen, this year, raising grain, and you might raise it next year. It is cold and windy there, and it is warm, also, in the daytime in the summer; and that is an alkali area. There is alkali in the soil, and the water as well.

In going through the Christmas Lake Valley and the Fort Rock country I didn't see any sign of any $2,000,000 investment. It isn't along the road, at least. (2000.) As to whether I would myself undertake a farming operation in the Christmas Lake Valley, if they would ship me the whole valley, gentlemen, as old as I am I wouldn't have it, if they would give me the whole valley.
1094 If they put a railroad through it it wouldn't change my mind a particle.

The profit in the cattle business is not made by feeding on the range. As to whether it is profitable to produce cattle over in central Oregon without using the range for them to feed on, there's men in eastern Oregon raising cattle that don't turn them out at all, they are running on their own private lands. In fact, I fatten 200 steers that don't go out, when I get ready to put them on the market, and 50 or 60 head of cows, that don't go (2001) on the range at all. I can't fatten steers on the range. I can fatten cattle on the range. If a man don't put them on the range he won't make any money. I have lost a lot of money, and I have been running them on the same condition as well. The central Oregon range is not fully stocked at the present time. As to how many more head it will stand, it will be a hard matter for me to tell, but when I can go over in the Harney

Valley like they are this year and see hay stacks every place it looked to me as though it could stand a good many more thousand cattle; and the different ranches in my country that used to run 600 to 1,000 head of cattle hasn't even got a cow on it, hasn't even got a renter on. Because the men went broke, the depression, just went broke, that's all. The range conditions didn't break. The financial conditions broke.

Q. But you say that you go over in the Harney Valley and you see the hay stacks around, and that sort of thing, and you (2002) figure that more cattle can be raised in that manner, or from that source; but how about the range, the Government range, and the private range, over there, the pasture land? Will that hold more cattle than it has got?

A. Well, now, I will tell you, gentlemen, I can't answer that
1095 question. The outside range can hold more cattle, but I don't know anything about how the forest reserves is filled up. Now, I wouldn't say. But the outside range can hold more cattle, and a great many cattle is in pasture that isn't turned out in the Harney Valley.

Comr. McManamy. Mr. Mills, will you tell me something about where this high desert begins and where it ends? You speak of hay stacks and the development in the Harney Valley.

A. If I could see a map of that country it might be so.

Comr. McManamy. Well, this is a very small one.

A. If I could see a map.

Comr. McManamy. Is Wagontire on that desert?

A. Now, Wagontire is a very small area, and there's little springs that breaks out on the south side of Wagontire, runs away down and sinks in the desert. Now, that is where I stated the desert begins. Now, on the east it is—well, I don't know just exactly how big; I can get the distances. I could (2003) tell how far it is from Wagontire to Silver Creek—there's no water, only some lakes that Bill Brown has put dams in.

Comr. McManamy. Well, then, east and west the high desert may be considered as the distance, approximately, between Wagontire and Silver Creek? Here is Wagontire Mountain [indicating].

A. Now, you don't get water from Wagontire until you get—where is Alkali Lake?

Comr. McManamy. Well, Alkali Lake is south here.

A. Now, you don't get no water from here clear across to Wagontire. Now, there a bored well here—I can't tell you just how far out it is from Wagontire. Now, here is Suntex right here; Suntex is
on Silver Creek. Now, from Wagontire there's no water
1096 across that area with the exceptions of some lakes that Bill Brown has put dams across and hold the snow water. Now, they go from Sheep Lake here—he has held enough in that to have a little water, I think, the year around. I doubt whether it will be there this year. Sometimes it holds water; a good many years it goes dry. Now, from the west—which is west?

Comr. McMANAMY. This is west [indicating].

A. Now, you can just go clear through here. There is the desert [indicating].

Comr. McMANAMY. And here is Silver Lake [indicating]. (2004.)

A. Silver Lake, yes. The section of the country between Wagontire and Silver Lake is what I call the desert.

The very highest peak on my upper ranch is about 4,400 feet elevation. My lower ranch is about 3,800 feet. As to whether the elevation of the section called the high desert is about 4,500 feet, I really don't know the elevation of that desert. But I want to tell you something about elevations in this country, gentlemen, I can raise things—now, up in the timber they do raise it where it is a high elevation, tender garden stuff that I can't raise at my home place. It is just the protection of the timber, or some climatical conditions, what I can't explain.

Mr. DUNCAN. Mr. Mills, just one question: You spoke of small springs on Wagontire Mountain. Isn't it a fact that there is one creek that runs off Wagontire Mountain for practically the entire year, known as Egly Creek?

A. I haven't said but what the water ran practically off of Wagontire the entire year. I think it does, but it doesn't (2005) run very far. There is a creek running from springs. There would have to be a creek running from almost any spring. I think you understand that.

Mr. DUNCAN. Have you been to the head of Egly Creek?

1097 A. Oh, I have been all over Wagontire. If there is a creek in there that I don't know anything about it is a new creek, it has just broke out.

Wagontire is quite well-watered, but it is a very small area. There is plenty of water for livestock, on Wagontire Mountain. (2006.)

1098 J. R. HARVEY was thereupon called as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I am 63 years old, and reside at Grants Pass, Oregon. I am secretary of the Chamber of Commerce, Grants Pass. I have resided in Josephine County since 1901. I have been secretary of the Chamber of Commerce a little over two years. Prior to that time I was a mining engineer and mine operator, leased mines (2008); manager and operator of mines. I was engaged in the mining business in southern Oregon about 18 years.

As to my experience in investigating the mineral resources of southern Oregon and northern California: I have been practically all over that district. Two years I was one of the examiners for the Government on the classification of the Oregon & California lands from Roseburg south to the line—mineral, timber, and agriculture. During that period of time I had opportunities for observation of

the timber resources of the Rogue River Valley in a general way. I went over practically most of the odd sections, and going through from one odd section to another we went through the even, so we covered it pretty thoroughly.

During my experience as secretary of the Chamber of Commerce I have had opportunities for observation of the agricultural resources of the valley more or less. (2009.)

The territory affected by the petition of the Grants Pass Chamber of Commerce for intervention would be Jackson and Josephine Counties, part of Curry County, Del Norte County. Jackson, Josephine, and Curry Counties are in Oregon, and Del Norte County is in northwestern California, but they are all practically in the same watershed or same layout. That is, Rogue River Valley section which lies in the southwestern part of the State. Del Norte County is in the northwestern part of California. A portion of
1099 Klamath, Douglas, Siskiyou, and Del Norte Counties are also included in the Rogue River watershed. Siskiyou County is in California.

As to the area in square miles of the (2010) section of the country which you are here representing: Well, roughly, it is about 70 miles north and south and 120 east and west. It shows, practically, on the map. About 8,400 or 8,500 square miles—about 5,370,000 acres. That includes the Del Norte County territory. There are about 8,800,000 acres of land in Jackson County and about 8,200,000 in Josephine County. (2011.) There are about 950,000 acres of land in Curry County, but we figure on the south half in this territory alone. That would be a total of about 3,890,000 acres in southern Oregon. I don't know what the area in acres of Del Norte County is, but I can figure it very closely. Del Norte is, I think, the smallest county in California. I haven't the figures on Del Norte County separately. I put them all in together, except Jackson and Josephine Counties. I have got those separate.

This section is a mountainous country, interspersed with rich agricultural valleys, principally the Rogue River and its tributaries, the Illinois and its tributaries, and some of the Klamath comes in it. (2012.) And the Rogue River is the drainage river for all this portion of southern Oregon that we are talking about. The principal cities in the territory we are interested in are Medford, Ashland, Grants Pass, Crescent City, the Klamath Falls country. Klamath Falls is east of us.

The population of Medford is 10,000 to 12,000; Grants Pass, 7,200; Ashland, 7,000; and Crescent City about 3,000.

Ashland, Medford, and Grants Pass are in the center of the Rogue River Valley, and Crescent City on the seacoast. (2013.) And commencing at the eastern end of the valley is Ashland, and then Medford, and then Grants Pass. Grants Pass and Ashland are 45 miles apart by road; Medford and Grants Pass 32 miles apart. Ashland is about 12 miles from Medford.

1100 The population of Jackson County is about 35,000; Josephine, 15,000; Del Norte, 6,000; Curry County, 4,000; total, 55,000. The census in 1920 was at low ebb, and Josephine and Jackson County both have grown very rapidly in the meantime. Between the 1910 census and 1920 there was actually a decrease in population. Since 1920 there has been a very rapid increase; and also in the Crescent City area, the coast territory. (2014.)

The principal industries in that territory are agriculture, mining, and timber.

As to the assessed valuations of the lands in each of these counties, according to equalization made by the State Tax Commission: Jackson County is about 34,000,000; Josephine, about 10,000,000; Del Norte County, about 17,000,000; Curry County, 5,600,000; total 66,600,000. About 68 to 70 per cent of the land belongs to the Government—is tax exempt. That is in national forest reserves mostly. The national forests in the territory are Siskiyou, part of Klamath, part of Crater and just a small part of the Trinity, in the south.

The number of acres of tillable land (2015) in these counties are: Jackson County, approximately 160,000 acres; Josephine County, about 100,000 acres; and Del Norte County, about 18,000 acres to 20,000, or less.

As to the irrigation districts organized under State irrigation district laws that are operating in the Rogue River Valley: In southwestern Oregon, in this territory, there is the Talent irrigation district, Eagle Point, Gold Hill, Medford, Grants Pass, and Fort Vannoy. I have named them in their relative positions, from east to west—south to north, as we call it. The Rogue River runs east to west in that part of the valley. I am familiar with the Grants Pass and Fort Vannoy districts. In the Grants Pass district there are between 15,000 and 18,000 irrigable acres, and Fort Vannoy
1101 has about 1,000 acres. (2016.) Josephine County about 12,000 acres in private is outside of these irrigation districts. The total area of irrigated land in Josephine County under both irrigation districts and private districts would be about 30,000 acres.

The Fort Vannoy district, 1,000 acres, is in a very high state of cultivation. It was started several years ago—in a fine state of cultivation. The Grants Pass district started practically 4 years ago, and that is growing very rapidly. We have had in the last 3 years practically 1,200 new families going in on to that 12,000 or 13,000 acres. Most of that land in 1923 and '24 was in brush. The larger part of it is cleared and is in crop, in small farms, ten, the average farm, I think, in the district now is about 11 acres.

Q. These 1,200 families that have settled on these lands in the Grants Pass district, I assume that probably represents a population of 4,000 or 5,000 people?

A. New population. (2017.)

The Southern Pacific Railroad serves this territory. As to whether there are any other railroads in that territory: There are two short lines, two stub lines—one from Grants Pass west 14⅝ miles, and one from Medford east to Butte Falls, a little beyond Butte Falls—we know it as the P. & E. It is now the Oregon Owens. Del Norte County has no railroad facilities whatever, except a logging road just out from town, in the woods. No outlet. That is operating now, they are going into the woods about 4 or 5 miles, bringing in logs into the mill.

Curry County has really practically their first road this year, highway through north along the coast, open this year for real traffic. There are no railroads in Curry County.

As to the nearest railroad affording an outlet to Crescent (2018) City in Del Norte County: The end of the C. O. &. C. Railroad from Grants Pass west, now at Waters Creek, and the Northwestern
1102 Pacific, which is north of Eureka, about Trinidad. That is about 70 miles or more south in California.

The Southern Pacific was constructed into and through the Rogue River Valley about 1884. Settlement began in the Rogue River Valley about '52.

In shipping any of the products of this territory by rail, they must follow north by Portland or south by Roseville going to eastern points. The route would be north by Portland and east of Ogden, and so forth; east or south by Roseville, Calif. Roseville is near Sacramento, 18 miles north of Sacramento. I don't know exactly the mileage from Grants Pass to Ogden by the (2019) northern route. It is practically 300 miles from Grants Pass to Portland. They have got to go about 400 miles south before they get to going east.

The Pacific & Eastern Railroad was built out of Medford to Butte Falls about 1912, I think. Butte Falls lies northeast from Medford, about 32 miles. That railroad has been constructed to Butte Falls, and now they are 8 or 10 miles beyond (2020) it, as I understand it.

In 1910, 1911, or 1912 there was a survey made from Butte Falls to Willow Creek, north of Fish Lake and Diamond Lake, to what was then known as Harriman Lodge, across Klamath Lake, to connect to a point near Chiloquin, and also one from Harriman Lodge south to Klamath Falls on the east side of Klamath Lake. Those surveys were made by John F. Stevens and his party for the Hill interests, James J. Hill, who owned this Butte Falls Road at that time. The Owens Lumber Company, as I understand it, owns that Butte Falls line now. They are using it for hauling logs into Medford. They have a sawmill in Medford. They have a timber belt and timber area of land owned by them over in the Butte Falls territory; they have a large belt between Harriman Lodge and (2021)—principally north of Fish Lake, as I understand it.

1103 The California, Oregon & Coast Railroad was constructed from Grants Pass southwestward towards Crescent City about 1914 or 1915. I understand there is about 40 miles to be constructed

from the present terminus of the Butte Falls line, that is, the Pacific & Eastern, now owned by the Oregon-Owens Lumber Company, to Chiloquin on the Southern Pacific. And that would connect up the Pacific & Eastern, or Medford district, with the Southern Pacific and the Northern lines, the joint user line north and south.

The Grants Pass-Crescent City Railroad was constructed about 1915. As to who constructed that road in the first instance: The city of Grants Pass, issued a bond issue. It was a municipal railroad to begin with. About 14⅝ miles of that road have been constructed (2022) southwesterly toward Crescent City. That goes to Waters Creek. About 75 miles will have to be constructed to connect the present terminus of the road at Waters Creek with Crescent City. The intention of the municipality, the people who voted this bond issue, toward the construction of this railroad to Crescent City was to get out to Tidewater. That is, to construct a road, extend it on to Crescent City. That railroad would pass through what is known as the Illinois Valley, which starts out there about the 20-mile point. The center of the Illinois Valley, about Kirby, is 30 miles from Grants Pass. The Illinois River runs into the Rogue River about 20 or 30 miles from the mouth. (2023.) That railroad is in a receiver's hands, being operated by the city of Grants Pass, receiver. Two or three surveys were made to extend this railroad to Crescent City. The original survey was made in about 1900, 1901. The plans were commenced to build this railroad in 1900. So far they have got 15 miles of the road constructed and in operation.

If this Butte Falls line, what is known as the Pacific & Eastern, were extended northeasterly to a connection with the
1104 Southern Pacific, or some other line in Klamath County across the Cascades, and a line was constructed from Crane to Odell as proposed by the petition of the State public service commission, a savings in (2024) distance eastward of approximately 280 miles would be for fruit traffic from southern Oregon as against the present route.

We grow almost all crops of the temperate zone—apples, pears, about 500 acres of bulbs, grain, hops. When I speak of bulbs I mean flower bulbs—gladiolus, tulips, and so forth, our high state of cultivation there in the irrigation districts, the farmers are raising those with good profit. Pears and apples, hay, alfalfa, cherries, peaches, walnuts, strawberries, and so forth, are a large proportion of the agricultural products of that valley. (2025.) Raspberries, blackberries, and strawberries grow without any cultivation practically. We raise melons, and all sorts of truck crops. As a matter of fact, we can raise any crop that is produced in the temperate zone, except citrus fruits, practically. We do raise a few figs, but we don't consider that commercial. The climatic conditions for the growing of all crops of the temperate zone are excellent. We grow winter cauliflower, January, February, and March, spinach every month in the year. We have a long growing season, with cold nights. Corn, yellow dent corn and white, we have taken for the last 5

years, I think, the first prize at the Portland show for grain. We have corn in our exhibit there 15 feet 9 inches tall, and we have corn this crop, this year, over 12½ feet tall, cut in the middle of July (2026), the 24th of July. Some of these valleys are as rich valleys, practically, as in the West, anywhere in the world. And there's better cultivation, a better class of farmers which we are getting in all the time, and it will grow big tonnage per acre.

1105 The average farm in the Grants Pass irrigation district supporting a family is about 10 or 11 acres. In other words, we don't have any 160-acre ranches down in the irrigation districts. There has been invested in the Grants Pass irrigation district itself $1,500,000, and the private irrigation plants about $12,000, and (2027) $35,000 in the Vannoy district. The money was actually expended in those districts for irrigation works alone. They take their water from the Rogue River. There is an abundant supply of water for their land. There can't be a question of shortage, because they have twice or three times as much as the valley needs. It is a fact that they have the whole river available. About $1,200,000 has been expended for (2028) irrigation districts and on lands under private ditches, outside of these two irrigation districts I spoke about; there's about 12,000 acres, at $100 an acre. A little more than 12,000 acres of the Grants Pass district, of the 15,000 or 16,000 acres in that district, have been actually cleared and brought under cultivation and irrigation. That has been done within 3 to 4 years. The water was turned on about 1923, the last of 1923 and the first of 1924. The works were constructed during the war period, practically.

The average holdings in that district before (2029) the irrigation systems were about 60 acres. It is now between 10 and 11 acres.

About 1,200 families moved onto that district since the water was turned on to the land, into the canals of the system, and irrigation began. In one 12-months period that we have had an actual count of there was 481 new families came in there—61 per cent of them came from California—the rest of them were from all over the United States. In 1922 or 1923 there were very few families in that district, living on those lands—just a few little

1106 scattered farms, and mostly in brush and small timber, that has been cut off. Most of that land was covered with brush and timber and jack rabbits. It costs about $50 per acre to clear that land. (2030.) As to whether I think that is a conservative estimate: There were small patches, mostly cleared by the people themselves—some of them contracted as low as $28 an acre, some of it cost $70; $50 is about what they figure. Some of them sold some of the wood off of it, some of them broke even, but $50 is about what they figure.

I don't know what the total valuation of the farms in the district is, but it is all dotted with little new homes, and people raising garden truck, some bulbs last year. Farms and houses are in, and thrifty looking as a rule. That has all been done in the last 10 years.

This Grants Pass district extends from below the Gold Hill district in practically the Jackson County line, 6 miles east of Grants Pass, and about 10 or 12 miles down the river. This territory surrounds the city of Grants Pass (2031), and westerly of that, extending to the westerly terminus of the valley, is the Fort Vannoy district, a small district of about 1,000 acres, a little over. Both districts produce in general about the same kind of crops. As to whether they are subject to the general condition: They are in alfalfa, small farms.

Q. Can you give us some idea of the area of land in Josephine County in the Illinois Valley that is susceptible to irrigation that hasn't been irrigated or brought under irrigation?

A. The Illinois Valley is—the valley floor is variously estimated from 48,000 to 70,000. The Forest Service, their figure is 53,000 acres of farm land in the valley. The center of it is practically Kirby, 30 miles from Grants Pass.

1107 Q. And is there water available for those lands in the Illinois Valley?

A. There's forks—the Illinois River, the east fork, the west fork, Sucker Creek, and Althouse, in that territory, all go through this valley, and out of the 50,000 acres (2032), say, there are probably 5,000 acres under cultivation, about that, at the present time and are under irrigation. Most of that is irrigated from Tucker and Althouse, practically, but there is water available all through that district. There is an abundance of water. As to the 40,000 or 50,000 acres that isn't irrigated—that survey was made by Farmer Smith along about 1910 or 1912, I should think, and he made a very glowing report of the fertility and possibilities of producing tonnage in that valley.

There are storage facilities for the storage of water in the Illinois Valley, especially up Althouse and Sucker Creeks. Well, as far as that is concerned, the east fork of the Illinois, as well. Plenty of storage facilities. It is entirely practical to figure on irrigating that district at a very low cost. That district is 20 miles from railroad transportation. (2033.) That is the Waters Creek; the Grants Pass municipal railroad.

Q. How far is it from the Southern Pacific? The additional 15 miles?

A. Yes; Kirby is 30 miles—29 miles from Grants Pass.

The Illinois Valley was the first settled portion of Josephine County, and Kirby was the county seat. Southern Oregon was practically developed through the Crescent City gateway, a trail over the mountains through there that came in through Jacksonville and Kirby.

Josephine County has about 2,500 cows, compared with Del Norte, about 5,000 over there. Dairying is growing rapidly in Josephine County. We are making all of our dairy product into butter, shipping it south, mostly to San Francisco.

Assuming that the Rogue River Valley had a railroad con-
1108 nection eastward into Klamath County, and a line from Crane to Odell was constructed as petitioned for by the State public service commission, as to what would be the benefits accruing to this southern Oregon region, in respect to the agricultural (2034) products: It would give us a shorter line east especially for our pears and apples, etc., to our market. As to rapid transportation for these fruits in the valley: It would save a day or two; the same kind of construction of road, and so forth. As to what extent that would stimulate further development of these lands: Better transportation—our difficulty now is that we can only ship the cream of our products, the best, of the things in which we excel everyone else, practically. The pears are practically better than anyone else's in the country. Pears and apples are the great agricultural problem in southern Oregon today. The difficulty down there is the high price of getting the product to market (2035) and transportation facilities.

Exam. ROGERS. What was this line you said into Klamath County? You said you had two lines—the Crane-Odell line, and you had some other line.

A. No; we were talking about the cross-State Crane to Odell Lake Road, and this from Butte Falls east, east to the north and south line with the common user.

Exam. ROGERS. I didn't just understand what construction it was down in Jackson County and Klamath County that you referred to.

A. From Butte Falls, they are out about 10 or 12 miles beyond Butte Falls now with their road, and from there along the old Stevens survey across the lake, to a point near Chiloquin. From Butte Falls the Owens Lumber Company are now constructing down Willow Creek. I don't know whether they are going east here over to the Southern Pacific. I don't know just where they are going, but they are building on that line of that survey. (2036.)

1109 They informed me the day before yesterday they had just given orders to go along there 7 miles to their timber.

Exam. ROGERS. What I had in mind, the question as put to you was if you had this construction down here through Butte Falls and had the Crane-Odell line, that a certain thing would be true, what would there be without this line down here, and just with the Crane-Odell line?

A. Well, we would have to go around by the way of Portland or Roseville just the same as they are now. (2037.)

Assuming that a road was extended from Crane to Odell, thence into Eugene or any portion of the Willamette Valley as to whether there would be also a considerable saving in distance: We would be just about in the same position we are in now. We would still be south of Portland.

If this proposed cross-State line were constructed from Crane to Crescent Lake, on the Natron cut-off, that would provide the shippers of the products of Josephine and Jackson Counties with a new route

to eastern markets by taking the Southern Pacific line up to Eugene and then the present Southern Pacific line from Eugene to Crescent Lake and then the cross-State line east; that would be some help. That route would (2038) be shorter than Roseville and I think it would be a great deal shorter than it is going by Portland; I am quite sure it would.

Most of the pears and apples produced in the valley go to New York and London by rail. They go by Roseville, a good many of them, south and east and north. They go north around by Portland if they route them that way. The London shipments move by rail to New York. Eighty-seven cents, I believe, to New York, and $1.25 a box to London.

1110 Q. (By Mr. CHINNOCK.) What is your idea of the effect of this proposed extension, assuming that the railroad is built from Crane to Odell and that this extension was made from Medford (2039) to Butte Falls into eastern Oregon as a connecting line, what in your opinion would be the effect upon the construction of the road from Grants Pass to Crescent City?

A. I think that it would make it easier, stimulate the building of roads all through that section of the country and make more tonnage, and I think it would make it easier to get an outlet to the coast.

There is a harbor at Crescent City, and they have been coming in there with boats for a good many years in the early days, and they are shipping lumber out of there, about 40,000,000 a year on boats to San Francisco and San Pedro; and the Government is now building a harbor. They have a jetty out about a half or three-quarters of a mile that was built two or three years ago, and made a new appropriation of $710,000 for extending that, which they are working on at the present time. And that harbor, with a railroad from Grants Pass to Crescent City, would give the Rogue River Valley an outlet to the ocean. Construction of the road east would give us an east line shorter. For instance now, pears and apples, every day we can save in getting to the market cuts down the chance of loss by spoiling on the (2040) road, getting into the market. Now then, a shorter, quicker route is what we want for all of our products in this country, especially apples and pears.

As to the amount of timber which is marketable in character: In Jackson County about 20,000,000,000, Josephine 10,000,000,000, and Del Norte County 31,000,000,000; Curry County is 10,000,000,000, and from this area out of Siskiyou County we will take about 5,000,000,000, and out of Douglas County is 60,000,000,000. There is about 10,000,000,000 should come our way and naturally come into this watershed. So that would make 86,000,000,000 feet of timber that is in this area we are talking about.

1111 A large portion of this timber is mature and should be harvested now. I don't know where it is but I have something here on that. E. A. Sherman, of the United States Forest

Service, made a remark in regard to the timber the Government owns in this territory. That remark was made before the river and harbors committee, U. S. Army engineers, Washington, December 15, 1926. That hearing was about (2041) the need for a harbor at Crescent City, and after this hearing was when they made the final appropriation, this last appropriation, and the Government decided to build a harbor in accordance with the Army engineers' figures and plans. Mr. Sherman said "Timber does not all ripen at the same time and go down at the same time, but after it reaches a certain stage, from there on it about holds its own, the loss each year offsetting its growth. The aged veteran goes down but young growths spring up and in the long run it holds its own. If it were not touched, in 100 years there would still be 35,500,000,000 feet of timber"—that is, he is talking about the Government-owned timber in this area west of Grants Pass principally—"and do so as long as the sun shines and the rain falls, and during the next 100 years that we could have 50,000,000,000 feet and at the end of that time still have the equivalent of the original stand untouched."

He goes on and simply states that the could—if that could be harvested right along the Government would have a revenue of close to $1,000,000 a year from the ripe timber and would keep it going on as long as they just harvested the crop of the ripe timber, which is now falling down and making a fire menace, which is now not useful timber because you can't market it; it is too far from the railroad.

The purpose of the statement is, they could harvest (2042) 500,000,000 feet of timber a year from that area for 100 years
1112 and still have the original stand. It matures at that rate each year. It ripens and gets ready for market. Practically all of the redwood timber in this territory is in Del Norte County; very little in Curry. Approximately 75 to 80 per cent of the red wood timber goes to Missouri River points, as I understand. At the present time it goes to San Francisco or San Pedro, most of it, and then east by rail. It goes to San Francisco and San Pedro by boat, and then takes the coast rate to Missouri River points. About 60 or 70 per cent of it goes to Missouri River (2043) points, as I understand.

As to the natural market for the sugar pine, the yellow pine, the fir and cedar that grows in these forests in southern Oregon and northern California: California and the coast and eastern markets, Missouri River.

As to what per cent goes to the eastern markets of the lumber now being cut: I haven't the figures on that exactly, but 40 to 50 per cent of its goes east.

Q. (By Mr. CHINNOCK.) Mr. Harvey, Teutsch Exhibit No. 1 contains a statement about the tonnage, and so forth, available from Josephine County. Now what can you state as to the accuracy of that statement? What page is that on in that exhibit?

A. Page 21. It has some of our crops, and the 91 cars of (2044) mill feed, oats and barley, I would say it is about correct.
1113 Apples, 26 cars; that is low.

Q. That is low?

A. Forty to thirty-five—thirty-five to forty-five cars I would say there. Pears, 63 may be right.

Exam. ROGERS. Do you have in mind the heading at the top of the page?

Mr. CHINNOCK. The heading on the top?

Exam. ROGERS. That is the tonnage that will move over the proposed line.

The WITNESS. Yes; on that basis—I hadn't noticed that—on that cross-State line this is probably about right.

Q. (By Mr. CHINNOCK.) What are some of the figures there, to get them in the record, in connection with your testimony?

A. Mill feed, barley and oats, 91 cars; apples, 26 cars; pears 63 cars. Pears will increase, as considerably more in the last 3 or 4 or 5 years of pears have been put out. Bulbs 40 cars. That will all go east. And we will probably have that number of cars this year. Mill feeds, 55 cars; potential tonnage 185 cars within five years; if we get better transportation facilities you will see a step-up there that will be stronger than this.

The information with reference to who compiled that was derived (2045) from Mr. Teutsch and Mr. H. B. Howell, county agent who has charge of agriculture in our county. Mr. Howell has charge of agriculture in Josephine County. He informed me he prepared this for Mr. Teutsch for this county; and I will say in regard to Mr. Howell that we consider he is ultra-conservative in all of his statements. He is very conservative.

I have prepared a map to be used in connection with my testimony, showing the tonnage of timber and mineral available in the territory represented by the petitioner in intervention. That map shows all of
1114 Curry, Josephine, Jackson, part of Klamath and Del Norte Counties, part of Douglas. It shows the timber under the name of the county, the timber that is cruised and according to the figures of the lumbermen and Government figures in each county, and the position of the principal mines in the district that have either all of their ore or part of it, concentrates or whatever it might be, that will have to find its way to the smelter for treatment. In other words, it will (2046) have to have rail transportation. The heavy blue lines are railroads; no wagon roads, simply railroads; and the red line shows the C. & O. C. proposed line surveys from Grants Pass to Crescent City and up to Applegate, and over into Siskiyou County to Copper mines as well as from Butte Falls east to the Southern Pacific's line at Chiloquin and south of Bend, north and south right there. It shows all the railroads and the proposed extensions of railroads.

(Said map so offered and received was thereupon marked "intervener's Exhibit No. 32, Witness Harvey.")

My testimony is that with the extension of the Grants Pass to Crescent City Railroad a large part of the timber in Del Norte County will be available for shipment eastward. (2047.)

Q. Instead of following the water route to San Francisco and then going east it would go eastward via Grants Pass, Medford, Butte Falls, and the Crane-Odell line, if those lines are constructed.

A. For the reason the redwood will find a different market; it is a different material entirely from fir, pine or cedar; it has a different market, has a different treatment, and so forth, a different use largely.

I testified that most of the market for the redwood timber is in the Missouri river points; and I think about 50 to 60 per cent of it, I am not sure as to that, is for distribution St. Louis—it was a few years ago.

1115 About 75 miles of railroad or less will be required to connect the Grants Pass line with this redwood belt in Del Norte County to Crescent City.

I think about 40,000,000 feet a year of redwood timber is being cut into lumber at Crescent City in Del Norte County. (2048.) We have one sawmill there. There are large holdings of that redwood timber in private ownership in that county. I don't know whether I have the figures on that or not. There are 7 or 8 large owners, large holdings. I don't know as I have that. I don't seem to have that here. The largest owner and operator there is Hobbs Wall, locally known as Hobbs Wall Company, Del Norte Lumber Company. They own and operate sawmills at Crescent City, and own large areas of timberlands there at present.

There are 7 small capacity sawmills in Josephine County, 5 of them in operation. (2049.) There are no large capacity sawmills, 60,000 or 70,000 capacity. And they are just preparing to build a new mill at Grants Pass.

Q. What can you say in general, Mr. Harvey, as to the tonnage of agricultural products, forest and mineral products available in this territory, compared with other sections of the United States, say, with like railroads, or like lack of railroad facilities?

A. I think it would be difficult and almost impossible to find another 100 miles square, such as in southwestern Oregon and north California, that has as much tonnage ready—that has as much tonnage as there is in this 100 square miles anywhere in the United States, and that has inadequate rail facilities.

As to the existence of useful and valuable minerals in southern Oregon and Del Norte County: The Government report on useful minerals in the United States shows that Josephine County has a greater variety of useful minerals than any other like area in the United States. Jackson County, Del Norte, Siskiyou, Curry,

1116 Douglas, some of Klamath, has the largest tonnage of ore exposed, a great deal of it by nature. That is why it is found at present. And probably there are over 100,000 feet of shafts and tunnels, development work, at a cost of $10,000,000 or better, spent

in developing ore. A large amount of it is (2050) ready for transportation; it is ready for shipment.

In Josephine County alone the Government report gives a list of 46 or 47 useful minerals found in there, including clays and limes, quicksilver, iron, different kinds of copper, silicas, pyrites, talcum, etc.

As to an estimate of the amount of copper ores that are available in this territory, that is blocked out: Something in the neighborhood of 100,000,000 tons; and in the Alameda district the estimate of blocked ore is, say, 3,000,000 tons to 5,000,000 tons; that is by the engineer. (2051.) That is a ledge of 200 feet wide, cut by the river and exposed by the river. It is low-grade copper ore. That ledge is 200 feet wide, say 400 feet high. It is developed 400 feet high. In fact, it is 300 feet above the river and there is a shaft down 300 feet below the river in the ore. Say it is 200 feet wide, 400 feet high. That would be 80,000 square feet. That ore will go—10 cubic feet will make a ton; therefore every foot in would be 8,000 tons—every foot into the face that it goes, and it is about 200 feet wide.

I don't know that that ore will all move across the cross-State line. It will go, the matte, concentrate, matte, etc., will finally go to New Jersey, no doubt. I don't know how it will go finally. Now they have over 2 miles of work in that mine.

The Waldo district, the Queen of Bronze mine—the Waldo district, which is southwest of Grants Pass, a little west, the Queen of Bronze mine has produced close to $2,000,000—I think
1117 a little over that. That is a 23-mile wagon haul down to Waters Creek, the end of the Grants Pass-Crescent City Road, the C. & O. C. Road. To mine that ore now and to take it to a smelter at Tacoma at a profit, the ore must be (2052) 12 per cent ore or better, and according to Henry M. Parks there is probably 5,000,000 tons there. Henry M. Parks is the director of the Oregon Bureau of Mines. He made a report on that in 1915, that if the railroad was out close to the mine, built out another 23 miles, that instead of 12 per cent ore that it would be valuable or profitable to ship, 5 per cent ore would have practically the same profit. That is by saving that 23 miles of wagon or truck hauling, and the extra handling. And in that mine, in that district there are something like 20 to 25 times as much 5 per cent ore as there is 12 per cent ore. So the volume of ore depends upon its proximity to transportation.

As to whether this copper ore carries gold: In that group it carries about $4.00 average. That is the Waldo group. That Waldo group of claims is being operated at the present time. They have just been notified of a reduced rate from Waters Creek to Tacoma, which goes into effect, I understand, next month, and they have already started shipping, started getting their ore ready, and, in (2053) fact, this last week shipped their first car of ore, although

this car of ore will go on the present rate. That mine was previously operated during the war; some time during the war period. They operated at a profit then. I will read a quotation from a report of the Queen of Bronze mine. This quotation is from a report of G. E. Stowell, assisting mining engineer of the Oregon Bureau of Mines. He says, "The books in the company's office show that during 3 years' operation there was produced from the Queen of Bronze mine a total of 9,992.3 tons of ore, having a gross value of $432,440.82; and from the Cowboy 842 tons of a value of $13,562.91. The total net smelting returns, deducting freight and smelting
charges, was approximately $350,000. The number of cars
1118 shipped was 183. The grade of ore varying from 5.16 to
16.33 per cent copper and 4 ounces to four-tenths to forty-four hundredths ounces gold."

The Queen of Bronze and the Cowboy mine that they speak of in this report—the Queen of Bronze is the mine I spoke of, and the Cowboy belongs to the same company, is in the same (2054) line south, about 2 miles south. This company owns the Queen of Bronze, the Mabel, the Little, and the Cowboy, along the sidehill, and the ore was found and exposed by the creeks running down the sidehill and cutting this ore body. That is how it was found.

This same mine was the mine that was mined in 1900, about 1900 was developed, the Queen of Bronze, and the Monumental, which is south of the Bronze on this same map, southwest about 2 inches across the line, both being developed in about 1900 by the same company, Denver and Salt Lake—Denver and Colorado Springs miners, mining men, and they made a survey from Grants Pass to Crescent City of this route that is marked in red, purchased rights of way, made a survey, in order to get this ore to tidewater or to a point of smelter, which they expected to have at Crescent City. As I am credibly informed, they spent $137,000 on surveys, rights of way, terminal grounds at Grants Pass, 30 odd acres, and in 1906, I believe it was the day of the San Francisco fire, they were unloading a train of equipment to start building that road, and other interests were San Francisco interests and they loaded up their equipment and went away.

The map that I prepared and which has been identified shows the location of this and other ore bearing bodies to this section. (2055.)

Q. And does it show the tonnage?

A. No.

Q. Of these various ores?

A. Only in a general way. But I can give you a little
1119 insight into that. In the group south of there, Preston Peak
mine, 250,000 tons; that is practically the Preston Peak. Go over here to the Blue Ledge, or take the next one east of that, the Gray Eagle mine, which belongs to —. Those mines are all shown on the map; that is at the end of this stub road, stub survey. The Gray Eagle, there is 4,000,000 tons there developed by tunnels and

shafts and crosscuts, and in addition to that they have something like 12,000 feet of diamond drill holes, ahead in the ore. There are a number of other small properties, like the McCann, which is north of it in that district, but those smaller properties, their development depends upon the larger company getting transportation into the district.

The circle east of that, the Blue Ledge District, contains—I have a list here of 47 mining companies that own property in there. The largest one is the Blue Ledge mine, which has about 750,000 tons of high-grade ore and a large amount of low-grade ore.

They also have 4,000,000 tons of pyrite, which they blocked out and developed in their work of developing their (2056) ore. That district is marked with those two lines in a general way; it is about six miles wide and about 20 miles long.

I have a list of properties that have had more or less work on them from a few hundred feet to several thousand feet on each mine. Iron Hand, for instance, has about 420,000 tons; the Great Eastern about 150,000 tons; the Cook and Green has over 5,000,000 tons of pyrite. There is very little work done on it, but it is exposed by nature. That pyrite is for the same use practically as sulphur. And the Blue Ledge Company, the owners of the Blue Ledge, are the Guggenheim people, and the owners of the Tacoma smelter, are now making an effort to get that tonnage to the Tacoma smelter,
trying to get a rate which will enable them to ship that ore to
1120 Tacoma. They plan to build, if rates, and so forth, are suitable, a road from the Blue Ledge mine along this line north, on the Applegate River, through Ruch and over to Jacksonville, connecting with the Southern Pacific at Medford north. That line of railroad is now projected and they have hopes they will be enabled to get a rate which will enable them to move that (2057) tonnage. That is shown on our map. That is a dotted line going through Ruch to Jacksonville. That will tap this whole Blue Ledge district at the upper end of the Applegate River, which this line from Wilderville runs up.

Q. Now, from your observation and knowledge of that country, what in your opinion has retarded the development of these copper mines and the production of copper in that country?

A. It has always been a matter of transportation. All the copper and big tonnage is, as a rule, 40 to 50 to 60 miles away from rail transportation.

During the war a large tonnage of chrome was shipped out of this district, from Crescent City harbor, and hauled to Waters Creek and Grants Pass. Some of the largest deposits of chrome in the United States are practically on the line between California and Oregon, northern California, and southern Oregon. (2058.) I should say the figure we have is somewhere between 60 and 70 per cent of the chrome of the United States is in this mountain region here. Chrome steel is used for making chrome colors, khaki colors, and for dyes—hundreds of uses. The supply comes from Turkey,

Australia, and from Cuba, and there is no duty on it. It is now worth about $24 or $25 in Pittsburgh, and during the war, when the U-boats stopped boats coming from Australia and different parts of the world, we had to get our chrome in the United States. Therefore the value of chrome went up from about $20 to $125, and the Army, the Government notified us that every ton of chrome produced put another four soldiers in Germany, in Europe. So there was
1121 great effort made to get all the chrome we could. There were several hundred miles of wagon roads and trails built in this part of the country to get chrome to the railroad.

Q. Well what, in your opinion, is the reason for the lack of development of the production of chrome in that territory, which contains, as you say, about 70 per cent of the chrome produced in the United States?

A. That comes from foreign countries now, where they have cheap labor to make it cheap. If we get in difficulty again here, that is where they have got to get the chrome from for (2059) war purposes, and they are commencing to use if—if we have some smelters or iron furnaces on the coast, which are coming in the next few years, this is where they will get their linings for the smelters. They use this chrome ore for linings of the smelters, and for making certain types of steel and iron.

Comr. McMANAMY. I am raising no question as to this testimony, because I assume before you have finished you will in some way connect it up with this complaint, which involves a cross-State line from Crane to Crescent Lake. That is the understanding?

Mr. CHINNOCK. I will state that our theory of the situation is that that ore will afford a large tonnage for this railroad eventually.

Comr. McMANAMY. But you will have some way of reaching it?

Mr. CHINNOCK. Well, I hope so, your Honor. (2060.)

With respect to the lime deposits in southern Oregon: We have several on our railroad from Grants Pass to Waters Creek. From Waters Creek the C. & O. C. Road built a spur of 3 miles from Wilderville, a 10-mile point to what is known as Marble Mountain, and they are taking lime rock from there, making 1,500 barrels of cement a day at Gold Hill, east of Grants Pass, 18 miles on the Southern Pacific. That road during the first 8 days of this
1122 month handled 28 cars of lumber, 20 of them local, 8 went east; 75 cars of rock, that is this limestone, from Wilderville to Gold Hill; 6 of wood, 6 cars of logs, which came from 20 miles beyond our terminus of the road at Waters Creek, hauled in 23 miles out there, going to Portland. They were cedar logs going to Japan. And one car of copper ore; that is the first car of copper ore that has been shipped in a number of years, on account of the reduction of rate. Making a total of 130 cars in 8 days, or 16 cars a day over that little stub road. This lime rock is very high grade. Most of that runs from 97 to 99½ per cent; most of it 98 and 98½ per cent pure lime. (2061.)

This Portland Beaver Cement Company that owns that Marble Mountain, which is marked 15,000,000 tons on this map, claim that now that they have opened it up they have 2,000,000 tons of lime in that belt. That 15,000,000 tons was exposed by nature on the top of the mountain. It stood up there. You could walk around it, without any mining. That is the way most of the lime is exposed in that area. This lime rock is shipped from Marble Mountain, where it is quarried, over this C. & O. C. to Grants Pass, this little stub line, and then via the Southern Pacific to Gold Hill; and then it is manufactured into cement. That cement goes all up and down the coast. That lime plant, in addition to shipping in gypsum from Nevada, ship in crude oil—I have the figures but I can't furnish them just now. I think you have them. Some of this lime rock has also been shipped to Oregon City, south of Portland here, to the paper mills, and into southern Washington, on account of its purity. It is so high grade that (2062) it is cheaper for them to pay to get it from southern Oregon, where it is a little longer haul, than it is from some nearby places in Washington, where the grade is not so high.

1123 As to what extent the natural resources of this territory, Jackson, Josephine, Curry, Del Norte, Northern Siskiyou Counties and southern Douglas, have been developed and utilized up to the present time: Well, in agriculture, for instance, in only a few of the richest places, where we have grown a few of the crops to the highest quality. And as to timber, it has not been started. And in the mineral mining and mining tonnage it is hardly scratched. On account of its isolation away from transportation, until the last few years, there were very poor roads. (2063.) Of the mining tonnages, there is none here except what has practically stood out of the ground. There has been no hunting and searching underground for possible more ore.

I am acquainted with the sentiment of the people living in this area shown on our map, toward the railroad construction project that is involved in this proceeding, namely, the building of a line of railroad from Crane to Crescent Lake. I know that they are very anxious to get a cross-State line in the southern part of Oregon, through the southern part of Oregon, this part of Oregon that is tax exempt. We are hoping to get it developed and get more people in it as to divide the tax burden over a larger number of people and therefore develop the southern part of Oregon. I have not observed in the whole area any division of sentiment on that point among people that really know what it means.

Efforts in our territory down there have been made to invite and enlist the investment of outside capital for the purpose of developing and exploiting these natural resources. They have met with success only in certain instances, where we are close to trans- (2064) portation, and where they could——

Q. What has been, as you have observed it, the obstacle to interesting capital in sufficient amounts to be invested in the development of the natural resources of this territory?

A. All the territory west, in fact practically all of Josephine
1124 County, the mineral resources and timber in there are too far from transportation to be of value or interest. Some people have been buying timber, held it for a long time, hoping for transportation. With the present roads, 15 or 20 miles is about the limit they have been hauling logs to the mill by wagon road.

[File endorsement omitted.]

1125 CHARLES T. BAKER was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I am twenty-eight years old; reside at Medford, Oregon, and I am secretary of the Medford Chamber of Commerce; which position I have held about two years. In that position I have had occasion to investigate the agricultural, timber, and mineral resources of the county to a certain extent. The population of the city of Medford is about 12,500 and of Jackson County, about 25,000. I know the principal industries of my county—they are agriculture, mining, and timber. The agricultural products are principally deciduous fruits, apples and pears, vegetables, hay, grain—almost any product that can be raised in a (2066) temperate zone, with the exception of citrus fruits. The pear orchards at the present time, there are some 10,000 acres—about 10,272 acres—of which 5,176 are over sixteen years old, meaning that that number of acres are in full bearing at the present time. Pear trees reach their full bearing stage at about fifteen years.

The climatic conditions of my county are equable the year round, with very few extreme temperatures either of heat or cold, and the soil is extremely rich in nearly all parts of the county. Tributary to Medford, that is, in Jackson County, there are four major irrigation districts, having a total of 29,988 acres. In addition there are 38,381 acres under private appropriation for irrigation, or a total of 68,369 acres under irrigation. (2067.) There is plenty of water for irrigation at all times for the lands under irrigation at present. The acreage of irrigable lands in irrigation districts in my county alone is 29,000 acres. The cost of the irrigation systems of these districts themselves was about $2,980,000, invested in irrigation works alone.

The total cost of irrigation works for all the lands under
1126 irrigation in my county is about $6,818,000, including the lands under private ditches. They irrigate the pear orchards down in that country.

As to the growing season for crops in that valley, certain crops can be grown throughout the entire year; that is, growing is in progress throughout the entire year for different crops. (2068.)

Land values vary according to the extent of cultivation of the land. Land can be obtained as low as fifty dollars an acre under

irrigation. On the other hand, fully developed farm land, orchard land, is worth as high as $1,500 to $2,000 an acre. That is where they have the full acreage in maturing trees.

The principal agricultural products of these lands, aside from pears and apples, are vegetables, small fruits, hay and grain, and dairy products.

As to the increase in fruit tonnage in my part of the valley, in the last three or four years since I have been there: The principal tonnage in the Rogue River Valley has increased rapidly in the past five years and undoubtedly will increase as rapidly or more rapidly within the next five years. The production of pears in my county in 1927 was 2,911 carloads, which was the amount shipped out of Medford. Ninety per cent of them went east of the Missouri River (2069) and were shipped by the Southern Pacific through Roseville; the majority of them went east.

The average haul for that season, as nearly as we could determine, is 3,292 miles per car.

I consider the greatest handicap to the production of pears in that valley is marketing, and I include in the word "marketing," the facilities for handling the distribution of the fruit; that is, transportation and selling. The transportation cost for marketing the 1927 pear crop was approximately $1,250,000, for freight. I estimate the 1928 pear crop at about 3,500 or 3,600 carloads and the apple crop at about 500 carloads (2070). The acreage of the 1127 apple orchards in my valley is decreasing. Pear plantings are increasing every year. The amount of capital invested in the fruit industry in the Rogue River Valley is not less than $10,000,000.

Pears are marketed through agencies located in Medford and having offices in the East in the principal markets, of which there are 21 in the city of Medford. There are cold storage facilities there to the extent of about 390 carloads, and packing houses to take care of the crop each year. Part of this pear crop goes abroad to Europe, to London, and that is shipped by rail eastward; and some of it comes to Portland and goes around, ships from here, but the majority (2071) of it goes East and is exported from New York.

As to the advantages, in my opinion, in a shorter route eastward for transportation of this pear crop: If a line was constructed from Crane to Odell and made to connect up with the Medford line at Butte Falls, it would save at least two days in transportation east on a highly perishable crop. In any event, if the line from Crane to Odell was connected up there would also be a saving to a certain extent through Eugene, but it would not be as much as if the other line was constructed.

Exam. ROGERS. If I understand, Mr. Teutsch is the principal agricultural witness in this case so far, isn't he? He did not allow anything for Jackson and Josephine Counties, excepting in the instance that this Butte Falls line was constructed.

Mr. ELLIS. Except he allowed 50 cars of feed. Inbound shipments of feed at 50 cars is all the allowance, I believe.

Exam. ROGERS. Well, on pages 21 and 22 of the exhibit——

Mr. ELLIS. Yes; on page 22.

Exam. ROGERS. Concerning the 50 cars he concluded, "Fifty per cent of this total tonnage available within five years if (2072) Butte Falls line is built." Now do you agree with that, Mr. Witness, or not?

1128 A. I believe if the Butte Falls line is built, a good portion of the fruit tonnage would move that way rather than south.

Exam. ROGERS. What if it is not built?

A. Well, I can't say. Some of it undoubtedly would; I don't know how big a percentage.

As to the pay roll of this fruit crop; there are about 4,000 people employed for a period of a month and a half, and the pay roll would amount to about $750,000 a year—I should say two months and a half. As I said before, the tonnage of apples shipped out from Medford is decreasing, but this year's crop is estimated at about 500 cars and the decrease is being taken care of by an increase in the pear shipments. Other agricultural products in the line of vegetables, and so forth, are not being shipped out to any great extent, on account of marketing conditions. Small fruits, cherries (2017), apples, prunes, plums, and apricots, are shipped out and are shipped east to some extent. There is one cannery in my city. Part of these canneries go east; part of them are distributed on the coast, about 40 per cent, I think. This year practically all of the output of one of the canneries will go east on one consignment order.

In my opinion, the chief problem confronting the agricultural development of my county is distribution. I have a statement in reference to the destination points of pears shipped out of Medford in 1927, secured from the individual shippers in the Rogue River Valley. It purports to show the number of cars shipped to the various cities and the various States of the United States, the weight of these cars, the rate paid, the total revenue paid, the mileage of haul and the average haul. (2074.) I prepared it myself from reliable sources of information. (2075.) The statement shows destination points of about fifty per cent of the pear crop in 1927 and does not show the destination of all the crop, for the reason

1129 that the portion of the crop that was sold while en route or diverted after being sold, we had no definite record of its ultimate destination, and this shows only the tonnage that we absolutely knew was delivered and unloaded at these points. It is indicative of the distribution of the entire crop, however. (Said statement was thereupon received in evidence and marked "Intervener's Exhibit No. 33. Witness Baker.") (2076.)

Exam. ROGERS. Before we leave the fruits and pears, do you know how they are routed?

A. The majority of the fruit is routed from Medford, through Roseville on the Southern Pacific.

Exam. ROGERS. Does the shipper route it?

A. There is some routing through the Portland gateway, but it is restricted routing.

Exam. ROGERS. What I had in mind was, does the shipper route it, tell the carrier which way to take it, or do they leave that to the carrier?

A. Well, as I understand it, this condition is such as this: If it goes through Portland there are only certain routes that can be taken, and if it goes through the Roseville gateway then it can take almost any of several routes east.

Exam. ROGERS. Under the tariff, you mean?

A. Yes, sir; under the tariff.

There are about ten or twelve sawmills in my county; I do not know exactly. The annual output of those mills is about 125,000,000 feet. The annual pay roll is about a million and a half. (2077.) A few over a thousand men are employed in that industry. The lumber produced at those mills is shipped to various points; some of it goes to California; about sixty per cent goes east, which is shipped by rail. The annual freight paid on lumber shipments is about $1,250,000. The estimated shipments of fruits, lumber, canned goods, vegetables and other products out of Medford for 1928 is approximately 9,700 cars. Outside of the fruit, ninety per cent of it goes to eastern destinations; of the lumber about sixty per cent; this year's canned goods, most all of them will; and the vegetables and other items will practically all go to coast points.

1130

As to the incoming freight into Medford in 1927 and 1928 (2078): In 1927 there were 3,154 carloads; the first seven months of 1928 there were 2,455. That freight had wide distribution; some of it came from the East, a good majority of it came from the coast. It would be very hard to determine what percentage of the inbound freight came from the coast. I would say, just as an estimate, about one-half of it; maybe a little more. Oil and gasoline shipments into Medford come from the oil fields of California and are shipped to Portland by boat and then come down to southern Oregon via the Southern Pacific.

In stating that vegetables would probably all go to the coast, I had in mind such vegetables as cabbage, peas, beans, carrots, beets (2079), squash, cucumbers, and so forth, that are marketed here in Portland or in California. There probably is a substantial market for those products in the Middle West and East, but owing to the highly perishable quality of these products, it would be difficult to reach that market over any route. The cross-State line would let us into new territory for marketing that class of commodity. It would probably encourage canning plants, which would carry their products into new territory.

Q. Well, do you know anything about the markets at Salt Lake, Spokane, and other interior points for such vegetables as you mention?

A. Yes; there might be.
Mr. ELLIS. That is all.

CMR. MCMANAMY. Cross-examine.
Mr. DEY. No. Questions.
1131 Mr. SPENCER. That is all. (2080.)

GEORGE W. DUNN was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I am sixty-four years old and reside at Ashland, Oregon; I have resided in Jackson County and in Ashland all my life. I am a farmer by occupation and I am also interested in the banking business, being connected with a couple of banks. I was formerly county judge of Jackson County for four years and I am now State senator from my county. (2081.) I have been engaged in the agricultural business practically all my life.

As to the actual and potential tonnage originating in the Ashland district: I have a statement prepared by the secretary of our chamber of commerce. The Ashland district is that district south and east of Talent, Oregon; that is about five miles west of Ashland; the district lays in the southeastern part of Jackson County. There is about 4,285 cars per year being produced, or ready to be shipped at this time. That consists of lumber products, granite, minerals, wholesale groceries, lithia water, mineral water, carbonic gas, canned goods; that is products shipped in, not shipped out. We have canneries in Ashland (2082) and there are sawmills there. We also have several sawmills in the foothills near Ashland; seven or eight altogether, I think nine. There is a great deal of mineral water there. It is not being shipped except in small quantity at the present time. There is water there that would produce practically a carload a day, of lithia water. The gas is being sold in tanks. There are four carloads a month now being sold. It goes on the Southern Pacific, the only way it can go. It goes north and south, is used for soda fountains and things of that kind. It can go in every direction if there was an outlet for it. I think a certain percentage of that goes eastward. The canned goods at Ashland, there
1132 are twelve carloads sold, all to go East for this year's output. (2083.) There is a vast amount of timber tributary to Ashland, east of Ashland and on the plateau south of the Little Butte Brakes, where the Keen Creek there breaks away, divides the territory, and running east to the summit of the mountain, west to the Lake of the Woods and south to Klamath Falls Highway; there is a billion and a half feet of standing timber. In the Keen Creek district south of the Klamath Highway there is about two hundred thousand feet—two hundred million feet of timber; and in the Pilot Rock district there is 40,000,000 feet; at the head of Neal Creek there is about 50,000,000 feet; and on the plateau, or the head-

waters of Beaver, Little Applegate, and Squaw Creek there is about 300,000,000 feet; and in the Ashland watershed there is about 150,000,000 feet; making a total of 2,242,000,000 feet of timber, or at an average carload of 25,000 feet per car there would be 89,600 cars of timber in that district.

In my opinion, the result of a shorter freight haul, or a shorter railroad facilities eastward, upon the development and production of resources of my district, would be that a great deal more of this timber would be shipped than there is at present. At present the mills are cutting white fir because it is light and the freight charges are so heavy they can't afford to cut the heavier timbers. They can get (2084) by with the white fir because it is a very light timber. The Moon Lumber Company is shipping three cars of that kind of timber a day now from Ashland east. The freight rates are practically equal to the cost of the lumber.

W. H. GORE was thereupon produced as a witness on behalf of complainants and, having been duly sworn, testified as follows:

Direct examination:

I am nearing sixty-eight years of age (2085) and am a farmer by occupation, residing at Medford. I was born within three miles of Medford, and have lived there all my life with the
1133 exception of about twelve years. My latter residence there has been ever since 1894. I am in the banking business at this time and president of the Medford National Bank. I have been interested in agriculture practically all of my life. I have had very excellent opportunities to observe the agricultural and lumber resources of my territory, and have been interested in those enterprises for many years.

Q. Can you tell us something about the copper ore of what is known as the Blue Ledge district in your county, the amount available—the amount that has been blocked out there?

A. In the Blue Ledge district there are only 20 developed properties, with an estimated or measured tonnage of perhaps, I will say offhand there is not any doubt—you can verify this by the figures of the engineers who were in superintendence of (2086) the development there, but in excess of two million tons of copper in that immediate district. That is, what I mean to say, copper that is blocked out, ready to stope out, if you please, and load on cars, or make any other use of it.

Comr. MCMANAMY. Where is the Blue Lake district?

A. The Blue Ledge.

Comr. MCMANAMY. With respect to Medford?

A. It is almost due south of Medford, a little west of south. It is on the northern—it is at the foot of the Siskiyou Mountains, the north slope of the Siskiyou Mountains.

Exam. ROGERS. Is it east or west of Ashland?

A. Well, it is west of Ashland. It is northwest of Ashland.

I can give you some idea of the amount of development work that has been done at these Blue Ledge mines—the amount of money that has been expended in the development of the mines. There are many thousands of feet of tunnels, upraises, and shafts. The tunnels are run on three different levels, and the ore body is measured by means of the diamond drill. The drill cores
1134 are assayed, practically every foot of these drill cores, and they are a matter of record in the office of the Blue Ledge Mining Company. The volume of high-grade ore in the Blue Ledge will equal a half a million tons; and when I speak of high (2087) grade ore—the low-grade ore will be referred to as five per cent and below, and there is ever so much more of the low-grade ore than of the high-grade ore. (2088.)

As to the amount of merchantable timber in my county: The State forester gives a figure of 20,600,000,000 feet. My understanding is the State forester gets his information largely from the Federal Forestry Service, and they are constantly amending their figures. The forestry office at Medford gave me a larger stumpage area last week and there are doubtless, according to the figures of the Forestry Service there, 22 billions of merchantable timber in the county, in the watershed; in the valley, in the north slopes of the Siskiyou Mountains, in the neighborhood of five billions additional; and in the southern slopes of the Umpqua on the north and the Cascades on the east, in the extreme northeast portion of the county, more than six billions of feet. It really stands near six billions of feet in Douglas County, and perhaps a half billion or a billion on the west of the summit of the Cascades and east of the Klamath County line.

Concerning the market for the lumber produced in this county: Local demand will consume about 15 per cent of the entire cut of the county. Then we have a demand that goes south largely—we don't ship any lumber into northwestern Oregon—but nearly 25 per cent of our total cut in marketed (2089) through the length of California. The rest of it is marketed in the east, from Missouri River points east, in the Middle West and the East.

Orchard lands may be valued, depending upon the age and development and care that they have received and the prospective capacity of the trees developed, from two hundred fifty for
1135 very young trees, and especially if they are not located on the very best of soils and most favorably located, to a couple of thousands dollars an acre, full bearing pear trees. The fruit crop produced in my valley, is not marketed in the valley. It is pretty hard for us in the valley to get any of our real best fruit produced there. It is put through packing houses there and shipped almost entirely to eastern market, excepting some of our apples at seasons of the year are shipped to Southern California, but that is a small portion of the crop. We have only one outlet, one means of trans-

portation to eastern markets, and they follow the Southern Pacific line. (2090.) Very little of our fruit is shipped north. We depend upon the service of the Southern Pacific Railway Company there and they furnish the empties and usually haul away our fruit by the southern route, usually distributed through the Ogden gateway. Much of this is shipped south, and the portions that are shipped into the Southern States go south through El Paso and are distributed from there; reaching the western and eastern markets most of the fruit is shipped through Ogden.

Exam. ROGERS. Do you know whether the shippers route their own freight or not?

A. Well, the shipper has a right to route his own shipments, without doubt, but he hardly has the privilege at that for it. As I said a moment ago, we depend upon the service of the Southern Pacific Railway Company out there and the lines—the sidings are lined with fruit cars, the Pacific Fruit Express, through all that valley right now, and I don't think that the people—that the producers there have availed themselves of any right to route their shipments, for it isn't—it is hardly practical under the conditions that exist.

Exam. ROGERS. Well, what do you mean?

1136 A. Well, that the tonnage originates on the Southern Pacific—in Southern Pacific territory—that is, there is no other (2091) railway that touches us, and we can't reach any other railway excepting over the Southern Pacific line. Now, I don't want to put this up to any criticism of the Southern Pacific transportation company—I think I would probably conduct the business the same way if I were it—but it is impractical for a shipper of fruit in southern Oregon to attempt to route that fruit by any other routing than over the Southern Pacific line, and that goes south, and so the volume of our fruit goes that way.

Exam. ROGERS. Well, what would happen if you routed it—if the shipper routed it through Portland?

A. Well, I don't know. I don't think he would continue the practice if he happened by chance to route some of it through Portland.

Exam. ROGERS. Do you think——

A. The other routing is the—the Southern Pacific Railway originates their fruit. They don't turn much of that traffic to any of these lines up here. I think we depend on the Southern Pacific Railway for service. They are giving us service and we are giving them our business from force of circumstances.

Exam. ROGERS. Well, they would have to turn it over if you routed it by Portland.

A. But then we don't pursue that. That has been practiced in a limited way, but it isn't generally practiced. (2092.)

The pear production in my valley is sure to increase, as it is increasing at the present time. Within the next five years we will

be producing more than double the tonnage of pears that we are at the present time. That list that has been filed here, I don't
1137 know just the number of trees shown on it, but you will find that the trees are well selected now, and these are the varieties that have been tested in the markets, and the young pear trees in the Rogue River Valley are of the most acceptable varieties and largely winter pears, the winter fruit that has been the most acceptable in the markets commands the largest price and the widest distribution. As I said, there is no doubt that within the next five years we will be shipping twice the tonnage of pears that we ship at this time, and many tracts are being planted at this time to pears, and it requires some years to produce any fruit from a pear orchard. When they begin to produce depends upon the care of the orchard, but the seventh year they will begin to produce a little, and at the age of perhaps sixteen or seventeen, they are in full production. They still increase in productive capacity after that period. (2093.) The planting of pears on a commercial scale in my valley began soon after the event of the O. & C. Railroad into that region in '85 and '86. We had some considerable orchards in the valley at the time that the Southern Pacific, or the O. & C. Railroad, built in there, and the railway for the first time in our experience provided a cash market for all the fruit that we had that we wanted to sell; that was shipped to Portland. That line wasn't completed over the mountains south. The new plantings began immediately, because it seemed to be a productive and profitable enterprise. In those years we weren't troubled with any of the what are known as pests or the difficulties confronting the fruit grower. All we had to do was prune our trees and cultivate them and harvest the crop.

Before the railroad came in there, the business was largely a process of barter and trade. I was a young fellow at that time, and recall that from an orchard my father had planted in '62 or '63, he exchanged apples and pears for every known product in
1138 the whole region; he traded apples for shakes, for shingles, calves, pigs, sheep, horses and a sewing machine, and to that extent fruit and the other commodities were legal tender of the country. We would exchange (2094) fruit for grains.

Exam. ROGERS. Mr. Gore, do you understand what is asked for in this case, in this complaint?

A. Well, I am answering the question asked me.

Exam. ROGERS. That is all right.

A. Yes, I think I understand it.

Exam. ROGERS. What do you understand it to be?

A. I understand the point aimed at in this petition is to arrive at a conclusion whether it is expedient or necessary to build a cross-State line from the region of Burns to some point on the west—I don't understand that the commission—that State commission in their petition would fix any definite point; but I am familiar with the wording of that petition, that it terminate at

Odell Juncton, or some point, some more desirable point convenient south of there. That is ——

Exam. ROGERS. And how do you figure that that is going to help you in Medford?

A. Well, I think that my last statements here in regard to what one—the introduction of the Southern Pacific Railway, or the O. & C., into that territory—it produced a market, it enabled us to turn our stuff. Without transportation we were absolutely cut off from the usual means of the transaction of business. Now, we are to the same extent limited at this time. The two considerations, the elements, if you please, in commercial transportations that are most important next to cost (2095) of the transaction is the time, the distance and the time involved in the completion of the transaction. I would like to direct my—whatever testimony I have to offer,
1139 to this one point, that while it is possible for us under present conditions without any other railroad to ship some of our products, a limited portion of our products, to market to dispose of them, to distribute them, if you please, that a cross-State line that would shorten our line of transportation to our potential markets would enable us to ship so much more of our stuff and so much more expeditiously, that the construction of this line would be justified in our behalf alone; we can produce tonnage enough down there to justify the construction of the road. That is what I would be aiming at.

Exam. ROGERS. Do you think that the shippers would route their shipments that way—going back to your remarks a few moments ago?

A. Yes; with the completion of the direct line I think they would; it would be optional with us then by what routing we would ship our fruit and our other products. I don't mean to say that we do not enjoy that option at this present time, but it isn't practical, the shippers cannot pursue the practice of routing their products over any other lines. There is this misfortune, the petition would seem to end this railway construction at Odell Junction or some place south of there along the line of railway transportation and then out, but in (2096) line with the first presentation of this matter to the commission, report by Mr. Newell, he himself admits that that road could not be built—this is his own language; I probably can't give just his language—he said that road cannot be built if it is to terminate at Odell Junction without provision for reaching the tonnage of western Oregon. Now, western Oregon in that petition, I think, means northwestern Oregon, for in all the discussion of the matter southwestern Oregon has hardly been mentioned. We admit that we are far from the center of things in Oregon, but at that we are in this position in southern Oregon, that the State or the Inter-
1140 state Commission or the Almighty or somebody else must come to our relief or we have reached, almost reached, the limit of our development along certain lines. The fruit will bear shipment, as was remarked by one witness that preceded me. We can

ship the highest grade products, for they will bear the investment, and the care, and the time and the effort, the cost of production, preparation for market, and the transportation, but we have a large area there, much larger than it appears to be on the map, a very productive region agriculturally, very productive of timber products, and I think—well, I don't need to think—I am well informed, and feel assured that the great tonnage to be produced in that region is mineral tonnage.

Comr. McManamy. Some reference has been made by previous (2097) witnesses to the extent of the Butte Falls line, what they think the possibilities are with respect to that.

A. Well, it probably isn't up to me to think, your Honor, but I believe that I see evidences that that road is being projected.

Comr. McManamy. Well, your thought as a representative citizen of Medford will be very helpful to us. I would be glad to have you give it.

A. Well, that is the general feeling down there, and the people of the entire region—I had—I haven't met anybody, with the exception of I was talking with three gentlemen the other day, and they wanted to know what would be the effect of this thing if the commission should issue an order for the construction of that road, what effect that would have upon the Great Northern building in there. Now, all people are not—"I don't know what the effect would be." I said to them, "and I don't care very much." We have plead and cajoled with every institution in the transportation business to get them to give us a little more and a little better transportation facilities, and we appeal to the Interstate Commerce Commission to
1141 just take into consideration our condition down there. We believe, and we are hopeful, that the operations that are now being carried on in railway construction between Klamath Falls and Butte Falls will result in the end in the completion of (2098) a connection that will give us some sort of means for a more direct eastern outlet.

Exam. Rogers. Is that what they proposed to do, to open Butte Falls to Klamath Falls?

A. Well, that is—the indications at this present time from the operations of railroad construction would seem to indicate—and I can't say that I am informed; I am not on the inside of either of those companies that are doing this construction up there—it is purely imaginary, I suppose, but the indications are that the one is building into the other, and I know that one of them—or at least I am informed that one of them—has timber south of what would be the necessary terminus of the other's line if he built far enough north to get on to his timber; they are going to have to build right by one another there in order to get to their own timber.

Exam. Rogers. Is the construction of the Black Butte—or, rather, the Butte Falls—line certain enough, in your opinion, that you would make a loan predicated on that as insurance that you would get your money back?

A. Well, I would regard it as a [illegible] loan, I will admit, if I was making a loan on that number.

Comr. McMANAMY. We will suspend until 1.30.

(Whereupon, at 12.30 p. m., August 16, 1909, a recess was taken until 1.30 p. m.)

After recess (1.30 p. m.)

(In the absence of the Witness Gore, proceedings were resumed as follows:)

1142 DR. J. F. REDDY was thereupon called as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

I am sixty years of age; have resided in Medford, Oregon, and Jackson County for twenty-three years. I am engaged in a great many lines—mining, farming, railroading (2100) and in 1907, I think, I was mayor of the city of Medford. At one time I was interested in the construction of a railroad from Grants Pass toward Crescent City; originated the idea of the building and built a railroad; which I operated, I think, for about a year. I am familiar with the construction of the Pacific & Eastern Railroad from Medford to Butte Falls; I built the first ten miles of it and then sold it to the Hill People in 1910, I think.

I am very familiar with the mining, mining of all kinds, in Jackson, Josephine, Siskiyou, Del Norte, and Douglas Counties. The particular benefit in the development and marketing of copper ore in this particular section of the country by the (2101) building of a railroad from Crane to Odell: It would vitalize the mining industry in those counties; start them up and they should function, where they cannot now. As to the probable tonnage of ore that might move eastward over the railroad: The district that we are talking of now, known as the Rogue River Valley, has more tonnage developed, more diversified mineral tonnage developed, than any portion—or any mining camp in America ever developed prior to getting rail transportation. There is no mining camp on this continent that has ever done so much prospecting and developing and produced so much tonnage as that district and spent as much money. There has been over ten million dollars spent on the copper mines alone in that district. Tidewater is the big market for copper; the transcontinental railroads is another and the smelters and smelting points like San Francisco, Tacoma, or Butte are also markets for the copper.

1143 As to the proposed extension of the Pacific & Eastern from Medford to Klamath County, I would say that if the commission would order somebody to build the Crane-Odell Road that probably in ten days the question of building that would be settled. It would be very desirable, and a very (2102) easy matter to finance. It would encourage the present owners and probably double the value of their assets, if they had a cross-country road, or had some other system of transportation other than the system they have at

the present time. I think they figure that if they have assets of five million now, this new system would probably mark it up to ten million.

Exam. ROGERS. You figure, do you, Doctor, that it would move across this new line to the Southern Pacific, and up the Southern Pacific to the cross-State line, and then across that way?

A. Yes. The timber on the coast, the redwood, would seek and go east via this projected line. This redwood would require extension of the Grants Pass-Crescent City line into Del Norte County where the redwood is. As to the effect of this cross-State construction upon the construction of that line from Grants Pass towards Crescent City: (2103). I am dealing with some people who are figuring on building this Grants Pass-Crescent City Railroad, and I have an option from the city of Grants Pass for a portion of that line. The city does not own it, but has an equity in it. Twohy Brothers have legal title to it and the city of Grants Pass has an opportunity to accquire the property from the Twohy Brothers if they pay them so much money. There is a suit pending in court over the matter of Twohy Brothers tendering it back to the city of Grants Pass.

I am interested in the construction of the Grants Pass-Crescent City Railroad, and if there were any assurance this cross-country railroad was going to be built that would practically settle (2104) the financing of it, providing the commission would permit 1144 them to build it. It is building into Southern Pacific Territory, and it would be a problem getting the certificates from the Interstate—The redwood timber owners claim that, and they go on record by evidence put up to the Government in some hearings formerly held, that more than 60 per cent of the redwood timber would seek the Middle West States, Omaha, Kansas City, St. Louis, Chicago. The redwood market, I think, is only taking care of lower California and Texas, and recently it has gone into Louisiana. You have in the room here, one of the best posted men in the country, a man that has been engaged in that business a good many years, and could give you more accurate testimony on that subject than I could—that is Mr. Owens. I am quoting the owners of the timber; whom I have been dealing with for the last fifteen years, and the statements I am making are statements that I have used a great many times in trying to induce capital to build this railroad.

In a general way my idea as to the benefits accruing to Southern Oregon and Del Norte (2105) County from the construction of this proposed line from Crane to Odell: It would liberate the people there. That country is the worst bottled-up from a railroad standpoint of any portion of the United States. There is no portion of this continent that is suffering so much from lack of transportation as that country known as the Rogue River Valley.

Exam. ROGERS. Doctor, let me get this straight, going back to your testimony a little while ago—Is it the so-called Stevens' survey

that you think would be followed from Butte Falls east to get to the cross-State line at present?

A. No; I think that they would go back down to what is known as Little Butte Creek on the map there and follow up Little Butte to Klamath Lake, the upper end of the Big Lake, and then cross over to—the Stevens' survey doesn't—I don't think they would
1145 use the Stevens' survey. I think they would come back to Butte Falls. The road is about ten or twelve miles beyond Butte Falls.

Exam. ROGERS. That is the territory that you thought there wouldn't be any difficulty about building across if the cross-State line was constructed?

A. Yes; I took Mr. Stevens across the country originally—that is, the route that the survey made. (2106.)

Mr. ELLIS. Along the same line, with reference to the survey from Butte Falls to a connection with the cross-State line, where did you have in mind the probable point of connection with existing lines, or with the cross-State line, established on the east side of the Cascades?

A. At Fort Klamath I think the Stevens—you see, the Hill people surveyed a road from Biggs, Oregon, to Medford, Oregon—from Biggs to Bend, and from Bend to Medford, and started to build originally from Medford to Bend, and shortly after started to build from Biggs to Bend, and the projected line at that time was at what is now known as Kirk, I think—Kirk or Chiloquin, or in that locality—across the upper end of the Klamath Lake.

I am familiar with the principal characteristics of that territory that would be traversed by the proposed extension of the Butte Falls line and there are no difficult physical barriers. The shortest distance by which a practical route could be constructed between Butte Falls and a connection with the Natron cut-off now would be the Stevens' survey—or from the end of the Butte Falls—or the Pacific & (2107) Eastern, which would be about thirty or thirty-three or thirty-four miles, and I think they would have to build about close to fifty miles by the route I think will be followed.
1146 The construction of the line would open up new territory that is heavily timbered and would justify the building of it.

As to the other sections of the State of Oregon, other than the one in question, I have travelled a great deal in Oregon and especially the eastern and southern part of it, and I don't know of anything that would help the State so much as the building of a cross-country line. I don't know any one thing that could create so much commerce, business industry, and change the complexion of the State as this cross-State line. The State is very backward. The other States south and north and east are growing, but Oregon doesn't seem to. It has got an awful black eye. Take the mining people, (2108) the copper mining people, while they have spent ten million dollars in southern Oregon, you can't induce any of them to come in. Lots of

the biggest copper men in America have had their money invested in southern Oregon for ten, fifteen, twenty years, but it is locked up there due to lack of transportation. They assumed when they went into these various projects there that if they developed them to a certain point the Southern Pacific would furnish them transportation. The history of the Southern Pacific will show that it has never furnished anybody transportation and doesn't at the present time. An analysis since the road has been completed will show they have never built any feeders for anybody, and have only initiated one or two lines, issued from an economic standpoint, not from a public demand. The present feeders were built by other people and after proven and shown to be good things were taken over by the Southern Pacific. I am referring principally to the branch lines in southern Oregon and Northern California (2109) as the Southern Pacific does not own any branch lines south of Eugene, Oregon. There's two or three feeders there, like the Pacific & Eastern and the Grants Pass, but they had nothing to do with the building of those roads;
1147 they were built in spite of them and have proven to be good things for the community and for the Southern Pacific Railroad.

In stating that my community is badly bottled-up (2110) I had in mind the country between Eugene and Chico, California, which zone has but one railroad. The country between Eugene and Portland has three railroads, I think, and a river and the country between San Francisco and Chico, California, has three railroads, competing lines, and the Sacramento River. The competition stops at Eugene on the north and at Chico on the south, and that strip of country, I think, is about three hundred miles long and has only one railroad. The people who live in that particular zone pay a higher freight rate than is paid in any other part of America, and in addition to that the development of the country is retarded and people are kept out of the country. It is practically impossible for anybody to engage in any line of business, farming, fruit raising, mining, almost any line of human endeavor and to compete with people outside of that zone. It is necessary to have a superior article, produce a high grade article, stand the high freight rate, be very selective and know his business to go into that zone and compete with the fellow who lives out of the zone (2111).

Cross-examination:

I know that the Southern Pacific Company has in the last fifteen years spent quite a little money in the construction of railroads in Oregon but they have spent very little at the request of the people; all the money they have spent is for the settlement of the Southern Pacific; and the public they are serving and that keeps them alive are not considered with these improvements. I can give you the history in detail of every mile of road they have built and the approximate cost. The Tillamook line to the coast was of benefit to

Tillamook County but the Southern Pacific Co. didn't initiate it; (2112) but they didn't propose to build that road (2113).

1148 Mr. Wiltsie and MacArthur-Perks were associated together, and started to build a road from Eugene to Coos Bay. A few weeks after they started, the Southern Pacific started a side line, started to run them out of the country and bluff them. They found out they were strong financial people and bought them out. The MacArthur-Perks wanted to assure the people that the railroad would be finished in the event they sold out and I think the contract between them and the Southern Pacific compelled the Southern Pacific to give MacArthur Brothers a contract to complete the road, and under that arrangement the Coos Bay railroad was finished. It was a case of where they just wanted to keep somebody out of their country, and were forced to do something that they might not have done up to date if they hadn't been forced to do it.

I got this information from Mr. Wiltsie, the promoter whom I know very well, and I was helping him at the time he engaged in that; I got some of the story from Judge Twohy, who was authorized to go into the field and build a road, a side line to MacArthur-Perks' road and Mr. Boschke, chief engineer. (2114.)

The Southern Pacific has lines projected all over the country that they are not serving at this time and if you try to beat it, they will spring the survey on you. They did not initiate the Tillamook branch; they built it. When the public try to work out their own salvation and they see the public are annoyed, and are going to do it anyway, they oftentimes step in and do it. That is the history of the building of railroads in Oregon, by the Southern Pacific. They have built a great many roads. They built the road into Klamath Falls. The citizens built 90 per cent, then Mr. Harriman bought it and built a different and better line and since that Southern Pacific has built a new line and spent ten or twelve million dollars in the reconstruction of the line the citizens initiated some ten or twelve years ago. I refer to the old Weed road. There was

1149 another one building in at that time that Mr. Lindley built. (2115.)

I think Mr. Owens would build the line from Butte Falls to a connection with the Cascade Line of the Southern Pacific, and if he didn't, probably the Hill people would be the logical people to do it. They are familiar with it and owned it at one time.

Assuming that the people I expect to build this road do build it for the purpose of hauling a portion of the Rogue River traffic over the Cascade Mountains and within a few miles turn it over to the cross-State line, I assume they would have some working agreement or some interest in the cross-State line.

Q. You don't think they would deal with it just as they deal with several thousand carloads of lumber every year, take it down the Deschutes Canyon and then out to Portland or Seattle, and then on east?

A. I think that a railroad company that could get a cinch on (2116) that freight and shut all the other competing lines out I think would do it. I don't think that——

Q. Well, what is the extent of this cinch? How long a stretch of haul would they have?

A. They wouldn't have to haul it very long, because it would depend a great deal on where the freight originated. If they owned the road on which the freight originated, I think it would be a great advantage.

Q. Why?

A. Well, it seems that there is an unwritten law or custom or a habit of the fellow that originates the freight, or owns the line on which it is originated; he has some advantages that the other fellow hasn't got.

Q. Then if your Great Northern, which now reaches Klamath and has trackage rights on the track with which your Butte Falls line would connect, would get its hands on this traffic over in your
1150 Rogue River country, it would no doubt hold onto that traffic as long as it could, wouldn't it?

A. I think that is human.

Q. Yes; and it wouldn't get onto the cross-State line at all, would it?

A. It would have to.

Exam ROGERS. Where did you have in mind that this traffic was going, Dr. Reddy?

A. Well, it would go—assuming, now, if the Southern Pacific (2117) complete their Modoc Northern, it would go east from Klamath Falls. If the Hill line could take it on down to Bend, down the Deschutes—that is, the Northern lines—if the cross-country road is built, if it is built by the Hill or Northern Lines, they would naturally try to divert it on their line.

Q. (By Mr. DEY.) Well, you haven't heard any one suggest that the Northern lines were going to build this cross-State line, have you?

A. Well, I think they are party to the suit here, if I understand it.

W. H. GORE thereupon resumed the witness stand, and testified further as follows:

Direct examination—Contd.

At adjournment time, I had not finished with the answer I had in mind with respect to my certainty as to the construction of the extension from Butte Falls to a connection on the east side of the Cascades (2118). I seemed to indicate a little reticence in saying how much I would loan on the certainty of the Butte Falls road being completed. I don't need to refrain from expressing my conviction that in case the cross-State road were to be constructed now and operations begun at once, the Butte Falls extension to connect across there would be completed before the other. I think it will be anyway, whether the other road is built or not. I am con-

1151 vinced of that. I have invested some money on the strength of my confidence in that.

I have knowledge of conditions all through the western portion of Oregon and to a certain extent through the whole State. My business has been for thirty-five years (2119) in the southwestern part of Oregon which has been my home. I attended four session of the legislature as a member of the house of representatives, which office, through my attempt to develop the country, which was centralized in the region north and east of Fort Rock and is commonly referred to as the Fort Rock Valley, has brought me in contact with the so-called high desert of central Oregon. I had something to do with the appropriation of $10,000 by the State of Oregon, under the advice of the head of the State bureau of mines and geology, indicating their conviction that water could be developed in a large area in the Fort Rock region and brought to the surface without even the use of pumps; that artesian water might be developed and (2120) money was appropriated and expenditure under it was committed to the State bureau of mines, under the administration of Mr. Henry M. Parks, who was then the head of the bureau of mines and geology in the State. Four wells were drilled, an average depth of 250 feet, and their water supply was to that extent tested.

I have examined those wells and seen them in operation for 26 consecutive hours, though not constant operation. I had been a party to the appropriation of the State's money for the purpose of investigating the practicability of developing the Fort Rock Valley, through the use of pumping and irrigation, and I noticed that in all of those wells, the water arose or stood at a level of 18 to 28 feet below the surface of the ground, dependent upon the altitude at the point at which the well was driven and in every instance the water seemed to maintain a constant level, after the first half second or probably a quarter of a second, the pump had been in operation. The water was lowered from 11 to 21 inches and stood there for 24 hours without changing a quarter of an inch——

1152 There isn't any doubt in my mind that the land may be developed and successfully farmed in the Fort Rock region, in the event rail transportation is made available. I have had some experience in farming and believe the Fort Rock Valley will be made a very productive region by comparison with the Fort Klamath Valley, the Wood River Valley, which were as desert as any part of the Fort Rock Valley. Water has been applied to the Wood River Valley and they have 18,000 acres of lawn, green the season through. The country is devoted only to the production of forage grass, pasture and hay. I visited this country again last fall and went pretty much over it, and I have seen the effect of irrigation on the land where it has been applied. (2122.) A little further investment to apply water to the irrigation of the surface is all that is needed.

As fine, as nice a stand of alfalfa, as prolific as you would see in America, you would see in the midst of the Fort Rock Valley.

I am not so familiar with the Christmas Lake Valley as with the Fort Rock, because the experiments have been made in the Fort Rock Valley and not the Christmas Lake Valley. My opinion is that Christmas Lake Valley would respond to the same treatment, however, and I don't know why my opinion shouldn't be as good as that of any other men who haven't had any more experience than I have, but geologists maintain that the same conditions maintain up there, it is practically on one altitude, about 4,400 to 4,500 feet elevation.

The effect upon the development of the State of Oregon, as a whole, resulting from the construction of the cross-State line in my opinion would be the certain development of the Fort Rock region into a rich dairy region, or if preferred, the greatest region for beef cattle. Our (2123) ranges south are devoted to the grazing of cattle and fattening of same. The Fort Rock region is well adapted to the production of alfalfa seed and none of the diseases or difficulties are confronted there. That portion will be made a productive
1153 area, and the chief benefit to our country will be the outlet for many of our products that are sold in the North and Northwest and will give us a direct routing east.

I had confidence to come before this body to offer evidence because I have the fullest confidence that the line will be constructed due west of the terminus as it has been indicated in the petition, and the thing that has directly concerned me is a larger commercial opportunity, larger commercial importance and the converting of our national resources into marketable products. The miners have an expression concerning ore: There is only one kind of rock that is ore. Ore is rock that contains enough mineral of some description to pay to reduce it and extract the mineral from it. The major portion of these mineral desposits in southwestern Oregon at the present time are just simply so much rock. It was truthfully testified this morning that in the Gray Eagle Mine, according to the statements of the engineer of that mine, that ore ran $6.00 per ton average in gold, and a dollar and a half silver, besides running from five to twenty per cent copper. Our difficulty of getting our stuff out, prevents our realizing these values and making them useful to about sixty-five million instead of about sixty thousand population, who want our product. Our success and the development of our country commercially is in getting in touch with those regions and facility to deliver to them our products.

Cross-examination:

The Mr. Parks I mentioned is Mr. H. M. Parks that used to be head of the Bureau of Mines of Oregon, and whose place is shown in Exhibit 21, and who (2125) is promoting development in the Fort Rock and Christmas Lake Valley. The money that the legislature put up was used to dig three or four wells over there and he is keeping pretty close tab on what is being done here. (2126.)

1154 I am quite sure there isn't a well on his place. If those witnesses who testified that it was on the H. M. Parks place are correct, then I am mistaken. I know the property referred to. I am producing about a thousand tons of alfalfa per annum, and the most I have ever raised on my premises is 3,200 to 3,500 tons. I am raising about one third of what I formerly did, and to make it profitable (2127) anybody should have $15.00 or $16.00 per ton on the car at Medford, as under present conditions it costs approximately $3.50 per ton for preparing for stacking and cutting; the reasonable estimate of tax on the land that produces that hay is not less than fifty cents per ton; the costs of production are not less than $4.00 per ton. Most of the farmers pay no attention to their tax, and only count the cost of the men: Two and a half a day and board. I can't do it that way, for I have to pay the cost of them, so if I should have a net to me value of $7.00 per ton, I should be able to realize eleven in the stack. It costs us $3.50 to have it baled, that's fourteen and a half. I hire the truck line of Medford to load that for me on the cars; it costs me a dollar and a half. I use my own truck, employ my own men in the hauling of it, and it costs me a dollar and a half per ton. This would allow a fair profit of $7.00 per ton.

As to who I expect to build the railroad from Butte Falls (2128) to the Cascade line of the Southern Pacific: I am rather expecting those who are building it now to do the major portion of it, but if any of the transportation companies would like to undertake an independent undertaking of their own, we will give all the testimony possible in evidence of the fact that that is a convenience and company to get a certificate, if it is possible for us to do it, but necessity for the people of southwestern Oregon. We will help any we believe that the people who are now engaged in the building are going to complete the most of that road.

1155 I will admit that some years ago I had some faith in the prospect of the Great Northern people to come over in my valley, and since the first of May they have been down to Klamath Falls over the Cascade line. If the Southern Pacific built that line over there it would do good from a competitive standpoint. (2129.) I think it would be well for that region to have competitive transportation interests. I made the statement this forenoon that I wasn't so much concerned with who built that road as that it be built and operated. The Great Northern is the one that is closest. I would welcome competitive railroad service in the Rogue River Valley individually and the community would largely do so. If the Great Northern built it, I think it would be the best-paying road they have if there is any opportunity to get the traffic to relieve the pressure on the east side of the Cascades and take it further east. (2130.) There would be considerable industries established that they could get to without any question.

I think to assume they have an investment of six or seven million dollars coming across there is an exaggerated price for building that

road, and I didn't represent that; it was somebody else's representation. I know it won't cost that. It will not exceed thirty miles of construction. The worst of it is constructed already, and they are near enough to the summit so that the major portion of the heavy construction is already (2131) completed. I am pretty well familiar with the country through there. The grading is heavy enough, but it is on the line of the John F. Stevens survey for the Great Northern Railway. The grades are over two per cent; part of it can be modified, but it will cost money to do it.

Q. Yes; well, say it costs them five million dollars, and they have got their investment in the Klamath line up to Bend, their investment down the Des Chutes and all the way east—now, if
1156 they come in there to furnish you that competitive transportation, you wouldn't expect your shippers there in that valley to treat them any differently than they are treating the Southern Pacific, would you?

A. I am not testifying to the solution of the traffic arrangements between the different transportation companies. I will admit without any question that I am not an expert on those matters, but I don't have to be an expert in those matters to (2132) know that a competitive line of transportation in there leading to the east is going to provide an outlet for tonnage that we are at this time not able to ship.

Q. Well, I am not challenging that statement, Mr. Goer, in these questions; I am not asking you as an expert, but as a business man, and a man experienced in that district, and a shipper from that district, and a banker who has had contact with all the business elements in that district for the past thirty odd years—I am asking you, in view of the testimony you gave this morning that your people didn't exercise their right to route traffic against the Southern Pacific—there are good reasons why they didn't, I assume——

A. Yes; that is the practice that has uniformly obtained, and it is far more likely and would be a practical business proposition, for the shippers to route their traffic over their rails to the eastern destinations that they serve, should any other competitive line be induced to come in there. (2133.) They will not necessarily route them via the Great Northern Railroad but by the road they prefer to ship over, taking into consideration time and distance, and price to the point of destination which is all over the east and south. I am speaking of fruit—pears, but if we had a line east we could ship more carloads of lime alone than we ship of pears. Lime and silica products are in demand, but just now our cost for transpor-
1157 tation enables shippers of lime from Bellingham to deliver it into Klamath Falls as cheaply as we can sell it and deliver it from the Rogue River Valley (2134), but if we had a direct line over there, our lime would meet all the demands of that entire section of the country, among others, because our lime is in demand; it is practically one hundred per cent sure. The lime plants are in eastern

Oregon at Lime station on the Oregon-Washington Railroad & Navigation Company, but we are going to ship our lime wherever they want our lime; at the present time we are shipping our lime to the paper mills of the Willamette Valley; your lime isn't adaptable; they want one hundred per cent lime. Irrespective of our shipments to the paper mills, pears are our principal agricultural commodity and the market for them is chiefly in the north and east. (2135.) Some of them cross the ocean to Europe, and if we understand that this line that you are indicating should be built by the Union Pacific, the Great Northern can't compete in time, can't compete in distance.

Q. Some of these people compliment the Union Pacific by wishing that cross-State line on them, and I am assuming that that would be the road for the purpose of the question, and I am asking you whether you would divert—or your people would divert that fair tonnage away from the Great Northern Railroad if it built into the valley, with the shipments destined to New York City and London?

A. I don't believe that any intelligent man will say that all of the pear shipments from the Rogue River Valley, if we had three equally important lines, that all of it would be shipped over any one line, but I am in a position to say, from a very (2136) good reason, that fifty per cent of the pear shipments would be routed over that line, because the saving in time and distance contribute to cost, and these are essential elements in every commercial transaction. We know the distance you have to cross to Odell, or whatever is the terminus, is that much further; the Union Pacific line will be the
1158 most direct line east by not less than two and a quarter hundred miles, and probably more, from the junction there of the Great Northern and here; from the cross-State line to our place. This is largely a question to be solved by the individual shipper in the end. I do not anticipate that the Modoc Northern will be the only means that is provided to shorten the distance east from Klamath Falls. I believe there is something else that will shorten the distance just a little more than the Modoc Northern will, however, we are pleased to (2137) see the Modoc Northern completed. You are working on that and if we can get this line across here at once we will have direct communication with the east. I believe I fairly represent the sentiment of the people of my valley—my town, and we haven't any favorites, particularly, among the railway companies. So far as I know the men controlling them are about the class of men that I like to know. It is a question of facilities, and one of the important features at this time is the origination of traffic and of car services and supply.

We have daily contact with the agent who is serving us, and this results in the routing of the traffic by the line that originates it and by the line that can serve. (2138.) All the billing and routing is done at the local station and an outside line has no equal opportunity and no chance of obtaining the routing of the traffic.

I am talking about the Christmas Lake Valley—the upper end of Fort Rock Valley. It is a great expanse and the Government engineers call the whole thing Christmas Lake Valley. In comparing that with the Wood River Valley, that empties into Klamath River—the Wood River: The Wood River runs there for miles; I imagine fed by the snows of the mountains, as it is rather a constant supply of water, and it is a stream of no inconsiderable volume and has a big flow; (2139) it is one of the principal factors in making
1159 that great inland lake of Klamath Lake, and it flows bank full almost to the surface of the ground, but I have no knowledge of the water in there having been diverted years ago, even by the Indians. A very small part of the Wood River Valley is in the Indian reservation and at this time there is no pumping process or digging of wells involved to irrigate the Wood River Valley. They have all the water they want for irrigation of that (2140) region. In comparing that region with the condition that obtains over in Christmas Lake: My knowledge of the Wood River Valley, from the time I first knew it, dates from when I used to ride after horses and cattle over that region and the major portion of it; was as desert, the same character as the Fort Rock Valley. It is practically the same kind of soil; like volcanic ash. I don't classify it as lava rock soil in the Christmas Lake Valley, it is practically identical with that in the Wood River Valley. I didn't hear the geologist the State put on here testify, but I am familiar with the facts; have known it for forty years or more (2141); have trodden over it and know the character of the soil. It is virtually the same soil and it is volcanic ash.

Q. What do they call the lava rock beds over there?

A. Oh well, there is some of it standing up around there, and we have lava beds over yonder as well in the Klamath region, and it is surrounded with lava flow. This Wood River Valley is surrounded with lava flow, a hard jagged lava rock.

Q. But you think the water——

A. Yes, sir.

Q. Has been there and made the transformation you are talking about?

A. Yes, sir.

(Witness excused.) (2142.)

GLENN IRELAND was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

1160 I reside at Crescent City, California, am fifty years of age; have resided at Crescent City for three years and am a realtor by occupation and am engaged in the real estate business.

The principal industries of Del Norte County are timber, dairying, fishing, and mining. We have three sawmills and a tie mill. The output of lumber of those mills is about 40,000,000 a year from the Hobbs Wall and about 20,000 a day from the other two small mills when they are running. They are not running now, but a (2143) new tie mill has just opened up fourteen miles north on Smith

River, working about ten men. Del Norte County is small and the area of redwood timber covers only 250,000 acres. The market for that redwood timber is San Francisco and I understand they are shipping out to the east, to Missouri River.

Dairying is the greatest leading industry over there. I think they sent out a little over 1,200,000 pounds last year. I think I have the figures on that. I might read this sent to Mr. Harvey from Jack Green, our sheriff of Del Norte County:

"JACK HARVEY,

Portland Hotel, Portland, Oregon.

"Last year, 901 tons, butter to San Francisco; shipped 181 tons of hay from San Francisco and sold at $30 per ton. Grain, 3,000 tons, San Francisco; fertilizer, 20 tons from San Francisco. This year 50 tons from San Francisco general (2144) merchandise for Rogue River Valley by trucks. For San Francisco from Crescent City 30,000,000 feet of lumber last year, over 40,000,000 per year at present rate.

JACK GREEN, *Sheriff*."

We are very much interested in seeing that a railroad gets into Crescent City. The improvements in the Crescent City Harbor has consisted of the Federal Government completing 2,200 feet of breakwater by capping it, and we understand they are going to let the contract right away for the extension, for which we have
1161 $710,000 appropriated by the Government. The Shell Oil Company has built a new wharf there at an expense of about $85,000. We wonder why they built such an expensive wharf just to furnish Del Norte County. Undoubtedly they are looking for some rail transportation to carry that back into the interior. We have about nine or ten miles of logging road that goes from Crescent City out to the redwood timber and the nearest railroad to Crescent City is about 65 miles south to Trinidad and 165 miles north to Marshfield and about 87 miles to Grants Pass. (2145.)

Exam. ROGERS. What do you hope to move through Crescent City when you get your port completed, Mr. Ireland?

A. Well, we have what we call there the mid-Pacific empire, which comprises a territory about 80,000 square miles, about 53,000,000 acres, and all that territory is tributary to Crescent City Harbor.

Now Irving Vining, the president of the Oregon State Chamber of Commerce, made the assertion in Grants Pass about a year ago that out of this territory less than 5 per cent of it is developed.

Now we have another—you were speaking about potentialities; we have another one there that I believe should be considered, and that is we are setting just half way between the Canadian and the Mexican line. We are just half way between San Francisco and Portland, and we have a big lake just about three miles from Crescent City, known as Lake Lindbergh. It covers about 7,000 acres. It ranges about one to forty feet deep. The Government has considered that as an air base.

Now we have had Lieutenant Donnelly from San Diego; Lieutenant Dillon, Lieutenant Wyatt, and all the commanders and captains off of the boats out to look at this proposition, and every one of them says it is ideal. Being located, as we are, just half way, right in the center, and having a low pass in the mountains,
1162 where it would be nearest the base of supplies, we figure that it would be of great importance for the (2146) railroad's insurance alone and for the insurance and protection of the country, to have that railroad come down in there where it would be protected by our boats, our battleships and our airplanes, seaplanes. It seems to me it is a great insurance, and that they could get to the base of supplies in good weather, or at any time, and they are right there to protect them. In case of your defense, if they was off here a hundred miles north or a hundred miles south, it certainly would delay the game and might cause a great deal of trouble in our transportation.

Exam. ROGERS. The question in the back of my mind was whether you were developing the port of Crescent City to move these minerals and things out of this Grants Pass country we have been talking of as moving over by rail across this line. What do you think about that?

A. Well, the Government owns about 80,000,000,000 feet of timber, and the Government is building that harbor, and there is a lot of this timber that ought to be moved now. It is getting overripe. So that is the way we have figured over there, that they will send this timber out through that port.

Exam. ROGERS. Did you figure that these minerals out of Josephine County would move through the port?

A. Well, I should—the way we understand, it would be better; we would get a lower freight rate and it would permit us to move all of our tonnage that is ready now for the market. (2147.)

Exam. ROGERS. Which way?

A. Well, it would go either.

Exam. ROGERS. By water or by rail?

A. It would go either. Very likely a lot of it would go by water and a lot by rail. I should think with this enormous amount of tonnage it would keep the water and rail both busy. There would certainly be an amount go by rail always, which it does.

1163 Traffic, in and out of Crescent City and Del Norte County, up to the present time moves by water and then by truck. There are no existing rail transportation outlets from Crescent City or Del Norte County. We people down there in Crescent City are not content to depend indefinitely into the future solely on water transportation for access to the rest of the world. We are looking forward every day to have a road coming in there so we can get our stuff out by rail. We can get it out more rapidly. Speaking about shipping your fruit, we can ship our fruit, I understand, right to-day New York City consumes 25 per cent of all their fruit (2148)

and vegetables, it is said, from the State of California, and if we could open that big district up there, certainly your railroads would have plenty to do by taking all that stuff right straight across, which they could do so much more rapidly and take good care of it.

We people in Crescent City and Del Norte County believe that the building of the cross-State line from Crane, Oregon, over to Crescent Lake, Oregon, would bring the day nearer when Crescent City might expect to look forward to a rail outlet to eastern markets. I should think that that could be brought right over. We are the only place without a railroad. You can start down here at the mouth of the Columbia River, they have their railroad; Tillamook has its railroad; Newport has its railroad; and so does Marshfield, and on south it is the same way. We are setting in there in a territory that is just crying for rails.

Cross-examination:

It is 87 miles from Crescent City to Grants Pass over our highway route (2149), and is probably the distance that would be traversed by a railroad if one were constructed; might be a little longer and might be a little shorter.

1164 I have investigated the ore that might be developed in Josephine County just in a general way, I know that by reading the house documents that we get, giving the tonnage, is all, maybe. That ore would go to a smelter somewhere; we kind of figure it would come down to Crescent City, we will build a smelter there just for this ore. If we didn't build them a smelter (2150), it is a question whether the easiest way to handle it would be to haul it down to Crescent City and then transship it by boat to Tacoma or to Selby, California, or if they could bring the rails in there they could probably bring it out cheaper by rail than they could take it down and load it and unload it again, with that short haul. I have made no investigation, though, to determine how that would work out.

S. M. Mears was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live in Portland; am engaged in rope manufacturing; the Portland Cordage Company (2151), as president of that company, which is engaged in manufacturing rope and harvesting twine at Portland. I have lived in Portland and been in business here since 1878, and during that period of time I think I have acquired a pretty general familiarity with the State of Oregon as a whole. My company is one of the members of the Portland Traffic & Transportation Association and I am one of the executive committee of that association. I have served as a member of the executive committee of that association five or ten years.

The Portland Traffic & Transportation is composed of manufacturers and jobbers and its general object (2152) is to keep tab on

traffic matters, and when any rate goes into effect, or we think it is going into effect, that would be detrimental to the community, we try to correct it, do what we can to prevent it or to correct it.

1165 Our dealings are altogether with traffic matters. I don't think there are any features of rail or water transportation, and the conditions under which it is afforded, that the association is not interested in, so far as they affect the city of Portland and the State of Oregon. That is, the welfare of Portland we consider—the welfare of the State we consider the welfare of Portland, being the only real exporting port.

The Portland Traffic & Transportation Association has about eighty members, somewhere along there, eighty or ninety, and I think it represents fully 75 per cent of the total shipping, manufacturing, and distributing interests of this city.

As to the various sections of this State, particularly with reference (2153) to their existing transportation facilities and the history of the development of those facilities in a general way, I have this knowledge: That Oregon has no transportation through the central portion. It has the Union Pacific at the north, the very north end of the State, and nothing at the southern end. There is a line up north and south on the west coast, and now it has been extended lately from Bend down to Klamath Falls, so that it gives a north and south line about a third of the way east from the coast. I imagine I have followed, generally, in past years the course of development of the transportation, rail transportation facilities, of the State of Oregon; and have kept myself informed generally with the history of the transportation development of this State and I think we can show the lack of transportation in the State has very much affected the growth of the State. I mean by that, the development of the State. For instance, it will be generally admitted, I think, that the climatic and soil conditions of Oregon and Washington are very similar. Washington State has four transcontinental roads running east and west; the Northern Pacific, the Great Northern, the Milwaukee (2154), and the Union Pacific,

1166 which serves Spokane in the eastern portion of Washington, and also Seattle and Tacoma in the western portion of the State of Washington. I don't think the Union Pacific has its own rails all the way from Spokane to Seattle and Tacoma. If you come down along the Columbia River, you go to the sound, they have a traffic arrangement over to the sound on the Northern Pacific road.

Q. But by that route, that is down through Pendleton and Umatilla and the Columbia River to Portland, and then north, the Union Pacific has a more circuitous route than the other three lines that you have mentioned between eastern Washington and western Washington?

A. They can ship by the Union Pacific, but it has to come down this way to Portland first.

In comparing the conditions in the State of Oregon (2155) and the State of Washington, I was going to say that the mere fact of their having four transportation lines east and west, the mere fact that the State of Washington has developed very much more rapidly than Oregon, it is natural to suppose that the transportation facilities have had a great deal to do with the growth of the State of Washington. That is my judgment and deduction from what I know of the transportation facilities of the State. The greater development in the State of Washington is evident by the growth of all the towns along. I think there are nearly twice as many people in Washington as in Oregon.

As to the comparative extent to which logging and lumbering in the two States have gone forward and been developed, I haven't any information.

I think I am familiar, in a general way, with the subject of this proceeding here; that is, the relief that the public (2156) service commission is asking for. I know that it contemplates the construction of a line of railroad from Crane, Oregon, to Crescent Lake, on the Southern Pacific, across the central or south central portion of the State. The Portland Traffic & Transportation Association
1167 intervened in support of this complaint. This complaint and the relief it asked for was the subject of discussion by members of the executive committee, including myself, a number of times. The reasons that actuated the association in intervening in support of this complaint was the natural inclination of every member there to have transportation developed in the State, because the business primarily depends upon transportation, and not having any development through the middle of the State east and west, we were anxious to see this road built, and we thought we were (2157) justified in asking it for the mere fact that when Mr. Harriman was in control of the merger he had planned an east and west road on this same line and had built as far as Crane. They had also planned one from what they call now the Natron cut-off. That was when the merger was done away with. That was deferred for some time. It was in the last year or two finished. I mean by "it was deferred for some time," that there was no work done on it. I don't know exactly if there was a gap between Oakridge on the north and Kirk on the south, but along the line of the Natron cut-off, whose building was deferred on account of the unmerger resulting from the litigation in the Federal courts. I don't know the exact points between, but that was deferred anyway and lately was completed. The permission to complete it was given by the Interstate Commerce Commission on the grounds of necessity and convenience to the public. If that was the case, I don't see why the same necessity and convenience does not apply going east and west from Natron, and Mr. Harriman was supposed to be a man of (2158) good judgment in regard to transportation matters, and his judgment apparently was that that was a feasible line, and a line that should be built.

I think we were justified in forming our opinion that it was a desirable thing for Oregon, and not an undesirable thing for the
1168 railroad, from the fact that Mr. Harriman sanctioned it during his administration. In mentioning the closing of that gap to connect up Oakridge and Kirk with the Natron cut-off; I consider that the uncompleted portion of Mr. Harriman's project between Crane and a point on the Natron cut-off constitutes a similar gap that ought to be closed.

I have given very little thought to comparing railroad facilities of the State of Oregon and California. I know there are four or five transcontinental lines—that is, east and west lines through California, and that State of course is developed way beyond Oregon and Washington, probably considerable of it due to transportation, but then they have had a good deal more climate to sell than we have, among other things. There is one thing that has influenced me in my belief that the railroad ought to (2159) build this line. That is the fact that the Union Pacific, in the first place, took no interest in the development of central Oregon. They had pre-empted it by having the line at the north and the Southern Pacific at the south. There was nothing done at all until the Oregon Trunk Line commenced to build up the Deschutes, then the Union Pacific got very busy and tried to block, by legal means, and failing in that they built down the opposite side of the river. Before it wasn't worthy of any development at all, but as soon as they apparently felt that the Northern lines might get into this pre-empted territory, they were willing to spend millions in a reckless way to build on the opposite side of the river. In my opinion there was never, or never could be, any justification for two lines of railroad in the Deschutes Canyon. (2160.) What I spoke of this at all for is that they showed at no other time the anxiety to get into central Oregon, or to prevent anybody else from getting in there. Now they should build a road east and west.

While this central Oregon territory has remained undeveloped with rail transportation, the Union Pacific system lines built into the Yakima country and I think, also made their traffic ar-
1169 rangements going over to the sound, and they built out from the sound in one or two places. At the time the Union Pacific built to Yakima and the Yakima Valley, the Northern Pacific had been serving them for years. The Union Pacific built a line about one hundred miles long, I think (2161), into Yakima to get there. The Northern Pacific and Great Northern were serving the Seattle and Tacoma region already at the time the Union Pacific lines extended their service.

Mr. Dey. Mr. Commissioner, I can't see, this is so far afield, that it has anything to do with this case. It does seem to me that within reasonable limits the testimony ought to be confined to the issue in this case. This case is not of large compass, when you get right down to it, and we have listened now to a great deal of testimony, with a great deal of patience on the part of everybody, testimony that has

little, if anything,—in fact, practically nothing to do with this case. We are limited in the number of days that are left to finish our testimony, and I think we are only fair and entirely right in asking that some limitations be put upon this.

Comr. McMANAMY. There has been some testimony introduced with respect to development of Oregon and California, and I think the question may be answered.

Mr. McCULLOCH. That was the last I had on that, but I don't want, in saying that, to apologize for asking those few questions, because one issue in this case is whether the construction of this proposed line will impair the ability of the defendants, or such defendants as may be required to build it, to perform their transportation functions, and I think it is (2162) pertinent on that issue to show very briefly, at any rate, what new construction projects into competitive territory have taken place in the past, while this particular territory has been left undeveloped.

Comr. McMANAMY. Proceed, Mr. McCulloch.

Q. What, in your judgment, Mr. Mears, and the judgment
1170 of the members of the executive committee of the Portland Traffic and Transportation Association, would be the result of the construction of this line of railroad from Crane to Crescent Lake, so far as it might affect the development of the State of Oregon? (2163.)

A. Well, it is bound to give a lot of cheaper land for immigration to take up, which now they are forced to buy higher priced land in the Willamette Valley; and I think it has a tendency to keep a good many of them out. Of course, whatever people settled in there will create business indirectly for Portland and for every other district anywhere near there, transportation companies and all. The potentialities of the section, I presume, are just as great as they are around Bend, and perhaps Klamath Falls, and the railroads feel they can build in there and only do it because they feel there is a prospect of developing the country that will bring in net returns in the end. When the railroads don't want to build in they can always find plenty of excuses and arguments for not building, and then again it is just vice versa, and never any of us know; it is like a new business, you start in a new territory and you don't know whether it is going to be profitable until you have operated it a while.

I don't know of anything more I can say to define and put before the commission the position of the Portland Traffic & (2164) Transportation Association with respect to the building of this line. It would be only repetition of the same thing in different words. In my judgment, I should think the public interest and convenience and necessity would be served if the line were built.

(A short recess was here taken, after which proceedings were resumed as follows:)

Cross-examination:

I testified that this matter of intervening in this proceeding was the subject of discussion on several occasions by our board of directors; we decided that it was advisable for us to intervene in
1171 this case in a discussion at the board meeting. I will be darned if I could tell you what originated that discussion.

I stated (2165) in words to the effect, that the line now petitioned for was a part of the old Harriman survey, and that as Mr. Harriman was a man of good judgment in railroad affairs the program must have been right, or else it would not have been undertaken. That was the foundation for my believing that it was justified from a railroad standpoint. When that survey was made and construction started I was here operating as a business man in those days, in 1906 and 1907. As I recollect it, at that time the two railroads, or systems, the Southern Pacific system and the Union Pacific system, were operated under one management and control, known as the Harriman system. I presume the company that was organized and made the survey across the State was a joint undertaking by those two companies, the line extending from Ontario on the east to Natron near Eugene on the west. From that, there was a branch line projected south to Klamath Falls from this cross-State line, at a (2166) point called Odell. That has been known as the Natron cut-off until now since its completion it is known as the Cascade line of the Southern Pacific.

When I say that nothing was started until the contest to build up the Deschutes Canyon, I didn't say that in connection with the Natron cut-off. It had nothing to do with it. The cross-State line was on two or three years, before the Des Chutes line was started, but I didn't understand that the Des Chutes lines had anything to do with the cross country line to eastern Oregon. It would connect up with the cross country line, extending down to Odell junction, but it wasn't built for that purpose at that time. (2167.) That is, the north and south line, the Bend line, I didn't understand had anything to do with the projected line east and west. When the
1172 construction was started from Natron south and from Klamath Falls north and from Vale west, the two systems, the Union Pacific system and the Southern Pacific system, were under a common management and control. I don't know when dissolution of that merged condition was brought about. I don't want to be tangled up in a lot of details, because I don't pretend to know the details. All I have said is, from the mere fact of Harriman, a prime railroad man, having selected this route across here, there must be some virtue in it and some justification for a layman having the opinion (2168) that that was justified from a railroad construction standpoint. I know, as a business man in this comminity, that there was a dissolution of the so-called Harriman system, whereby the Southern Pacific was dissolved from the control of the Union Pacific. That is a major condition, we all know that.

I understand that when that was brought about the so-called Natron cut-off, or Cascade line, now operated by the Southern Pacific, became the property of the Southern Pacific; and I suppose the original purpose of the cross-State line to get into western Oregon—the purpose of it (2169)—was absolutely prevented, and the cross-State line stopped at Odell on the east slope of the Cascade Mountains.

Exam. ROGERS. How did that prevent the cross-State line from getting into western Oregon?

A. Well, the cross-State line didn't go clear to the west coast; it didn't go clear to the Southern Pacific connection at Natron.

Q. (By Mr. SPENCER.) Well, if it was cut in two and the Cascade line went into the Southern Pacific management and the cross-State line was controlled by the O.-W. R. & N., the O.-W. R. & N. could not get into the western Oregon country, could it?

A. You came in from the east. What are you talking about? You came in from the east to the middle part of the State.

Q. Came into Eugene.

A. No.

Q. The cross-State line?

1173 A. The Union Pacific? You built from the east, west; didn't you?

Q. Yes.

A. That was your intention all the time, to build west until you connected with the Southern Pacific.

Q. Until we got into Eugene. (2170.)

A. At that time it was a joint road, and they wanted the east and west line to cross the State.

Comr. MCMANAMY. I think Examiner Rogers' question was intended to go to the point as to what, if anything, in this dissolution. would prevent the cross-State line from building across the Cascades into western Oregon.

A. I don't know that.

Comr. MCNANAMY. Do you know of anything?

A. I don't know any reason why they could not, either one of the roads, the Southern Pacific or the Union Pacific could have built it.

Q. (By Mr. SPENCER.) Well, you would not build a railroad across there?

A. No; nor would I——

Q. At two or three hundred thousand dollars a mile, would you?

A. Why, just the same as I would build a railroad up the Deschutes.

Q. All right.

A. Didn't you do that?

Q. You could not do it now probably.

A. No; finances are too high?

The WITNESS. Finances are too high. I only cited that as a reason for my believing that the railroads could be justified in building across the State, from the mere fact that Harriman had said that same thing. Now I don't know anything about the details of it. I don't think it is necessary that the Union Pacific ought to do it; it might be a joint road. I know, and every one conversant with the history of it here knows, was a facility that could get into all of these branches and all of these industries at that time
1174 in western Oregon. (2172.)

Q. Take the originating tonnage and haul it across the State, without hauling it up to Portland. Now that was the condition then, wasn't it?

A. I suppose so.

Q. Well, it is not the condition now, and has not been since January, 1913, when the Southern Pacific was divorced from the Union Pacific, has it?

A. No; I don't know that it has. But if you build across the State to connect with the present north and south lines, then you relieve the situation and develop that central part of the State. As to how the cross-State line would be supported without the western Oregon traffic that it was originally built to serve, is really beyond me. I am not in the railroad business. I haven't been over much of central Oregon; not across that line.

Q. No; well, if it is a desert country, without any living water, and without any production for a distance of 100 to 125 miles, with frosts, practically killing frosts in nearly (2173) every month of the year, the cross-State line would not be justified if it was to stop at Odell or Crescent Lake and not receive the western Oregon traffic, would it, if that condition obtained?

A. Well, why won't you receive the western Oregon traffic now if you connect there? You would not be allowed to build without making a traffic arrangement with the Southern Pacific, at any rate, would you? I don't know whether the Southern Pacific route has any traffic through the Columbia route of the O.-W. R. & N. Company now at Portland.

Q. Well, if it does not, and it takes the traffic from Washington County and Tillamook and its branch lines there, and its traffic originating at Portland, and hauls it down through Roseville, California, do you think it would give a cross-State line traffic
1175 from western Oregon originating on its rails?

A. If it hauls to Roseville and Ogden and gives it to the Union Pacific there, wouldn't it be shorter this way with the cross-State line (2174) for the Union Pacific to take and have a long haul on the whole thing? That is the thing you ought to do. I don't suppose that the I. C. C. would allow you to build it unless you first made a traffic arrangement with the Southern Pacific, so that they would give you a fair proportion of the traffic.

I haven't been over the eastern Washington country much, I have been over some of it, and have been over eastern Oregon country

some, and I know some of it is pretty desolate and some of it is
(2175) pretty good. Some of it is pretty productive, Whitman County is the biggest wheat producing county in the State. That is in the Palouse country, which is one of the greatest wheat producing belts of its area there is in the country. The southern part of Washington country towards the Columbia River is very fertile; when you get up north it is not. By the southern part, I mean along where the Northern Pacific runs. Garfield County is productive. I don't know very much about Whitman County or Spokane County, but I don't think the northwest or northeastern part of Washington, north of Spokane, is very fertile. We don't have so many railroads up north of Spokane. (2176.) The territory north of Spokane is not of particular interest or concern to the Portland Traffic & Transportation until we get a differential from up there. In any event, I think eastern Washington is a very fertile country by and large, and I don't know but what eastern Oregon will prove so, too, when it is developed. I don't know so much about that; it is a good deal like the whole of Oregon which in the early days was considered a desert out here.

I don't know if we have any Yakima Valley in eastern Oregon, I haven't been over there to see. Yakima Valley is a very rich
1176 valley; there is no question about that—one of the richest, I guess on the coast. That is the valley that was discussed in direct testimony by Mr. McCulloch and me and the one you built to.

In making the statement that these propositions were a good
(2177) deal like a business proposition, or a business enterprise, it is my notion with respect to this problem of rail service to make as good an estimate as you can; you draw upon your imagination for the potentialities of the country, and so forth; then if you are able to develop them it becomes profitable. You have to be careful that the imagination is not overdrawn and where you are going to spend about eleven million dollars in the enterprise it has a tendency to restrict that imagination. But then, you know, railroads sometimes lose control of their imagination, the same as you did when you built up the Des Chutes; about half of that being a joint line. (2178.)

Exam. ROGERS. Has it been joint all the time?

The WITNESS. I could not answer that detail. I don't know. I don't know a thing about the Alturas line, sometimes called the Modoc Northern line that the Southern Pacific is building. It may have been discussed in the Portland Traffic & Transportation Bureau and I not remember it. My memory is not very good.

Redirect examination:

The Northern Pacific's line built into the Yakima Valley and through Yakima and on to Tacoma, very many years, before the intensive development of that valley in fruit raising and other agricultural and horticultural pursuits began. (2180.)

W. A. CURTIN was thereupon produced as a witness on behalf of complainants and, having been duly sworn, testified as follows:

Direct examination:

My name is W. Curtin; I live in Portland; am secretary
1177 and manager of the Portland Traffic & Transportation Association. Altogether I have had about twenty years experience in railroad and transportation work, the last eight years in the industrial fields, prior to that with the Union Pacific System in Portland here in various capacities. I have been secretary and manager of the Portland Traffic & Transportation Association about six years; the nature of my duties in that employment is to carry out the expressed wishes of the executive committee on matters of importance to the community and to the State, traffic matters. Some of the major features of the work of the association (2182) is to file formal complaints with the commission when they are necessary in traffic matters, prepare and present the testimony in such cases, and to follow up anything that is transpiring in the traffic nature that would be of interest to our members. My work has given me a reasonable familiarity with the rate structures and the existing transportation facilities and transportation needs generally of Portland and of the State of Oregon.

I have prepared some data to illustrate the isolation of this eastern and central Oregon country from Portland, particularly from a rate-making standpoint and in doing that I have selected Crane, Oregon, as a point for the purposes of illustration.

Before starting with them, I want to say this: That at Crane probably there is not material consumption, or not a very great consumption of the commodities I have used in these few illustrations to show the remoteness of that territory from Portland, but it should be remembered that the rates to Burns, for instance, via Crane, are established as arbitraries over the Crane structure, and I think otherwise that the illustrations, whether there is a very material consumption at Crane or not, will illustrate just how far remote that territory is, measured by the rate structure, how far it will go (2183) from Portland, the industrial section.

1178 Crane is approximately 300 miles from Portland on an air line. It is within the third parcel post zone. It is approximately twice that far from Portland, or 558 miles via the shortest available rail route, and far more remote than that when measured by the rates charged for the transportation of freight from Portland as compared with the rates charged from other competing points. If and when the cross-State road is completed via Eugene, the distance to Crane from Portland would be shortened approximately 150 miles. It would be about 408 miles approximately, I guess.

To illustrate what I mean by its remoteness as measured by the rate structure, I want to make a few rate illustrations. For instance, on structural iron to Crane, 558 miles from Portland, the rate charged is $1.31, with minimum of 36,000 pounds. From Salt Lake, 574 miles,

a rate of 62 cents, 60,000 pounds, and 57 cents, 80,000 pounds. From Chicago, 1,955 miles, $1.22, 30,000 pounds, $1.00 a hundred, 80,000 pounds. The rate from Portland is the full fifth class rate, while the rate from the other points are published commodity rates. (2184.) Now, non-intoxicant beverages, from Portland $1.18½, 36,000 pounds; from Salt Lake City 89 cents, 30,000 pounds; from Chicago, $1.21, 30,000 pounds, and $1.05, 50,000 pounds. The rate from Portland is a combination of a 56-cent commodity rate to Huntington, plus a fifth class rate Huntington to Crane. The rates from the other points shown are commodity rates, from Salt Lake and Chicago. On canned goods from Portland, 558 miles, 98 cents on a minimum of 60,000 pounds, and $1.31 on 36,000 pounds. From Salt Lake, 574 miles, 49 cents, 60,000 pounds, and 60 cents on 36,000 pounds. From Chicago, $1.30 on 40,000 pounds and $1.05 on 60,000 pounds. The rate of 98 cents from Portland, 60,000 pounds minimum, is a combination of the 49-cent rate from Salt Lake to Crane. Under the intermediate application of the two tariffs the rate from Portland to Salt Lake will apply to Ontario and the rate from Salt Lake to Crane will apply from Ontario, making a
1179 combination of 98 cents. Now on nails from Portland in carloads, $1.31, 36,000 pounds; from Chicago $1.00 with 80,000-pound minimum. (2185.) Wire fencing, from Portland $1.31 on 36,000 pounds; from Chicago, $1.30 on 50,000 pounds.

Those are carload comparisons. There are a few less carload rate comparisons, too, that I have in mind. For instance, certain articles of drygoods that take in cotton blankets or cotton piece goods in less carload lots from Chicago to Crane, 1,955 miles, for $2.95 a hundred as compared to $2.54½ from Portland.

All of the commodities I have mentioned in these illustrations, and will mention in them, are shipped from Portland, and are commodities that I thought would move into that territory.

Finished leather, in less carload lots, may be shipped from Chicago to Crane for $2.04 as compared to a rate of $2.24 from Portland. Certain other kinds of leather may be shipped in less carload lots to Crane from Chicago at $1.88 as compared with a rate of $2.24 from Portland. These few illustrations show that while Portland is nearer to Crane than the other competing cities via available rail routes, it is more distant from Crane than any of the others if measured by the commodity rate structure, and that Chicago (2186), although three and one-half times as far from Crane by rail, is, under the commodity rate structure, closer to Crane than Portland is.

Crane is a part of the State of Oregon geographically, but is as remote at the present time from industrial and commercial sections of the State as it is possible for it to be. This is also true of a large section of the eastern and central part of Oregon.

We have long desired the construction of the line proposed, and now before the commission not only to correct this condition but primarily because we feel that such a line is necessary to properly develop the territory within the State that will be served by it.

The direct advantage to come to Portland from the building
1180 of the line will not, of course, be as great as the advantages to be gained by the communities and districts directly served, but as the State grows and prospers our city will also grow and prosper. The tariff references for the rates I have quoted are: Union Pacific Tariff No. 3040–B, I. C. C. No. 3789, covers the class and commodity rates from Chicago to Crane. Union Pacific Tariff No. 6045–C, I. C. C. No. 3753, from Portland to Crane. And the Union Pacific Tariff, O. S. L. 2040–I, I. C. C. No. 2568, from Salt Lake to Crane. (2187.) Although the direct advantage to come to Portland from the building of the line would not be as great as to that country itself, and to other sections of the State, the existing disadvantage to Portland would be remedied by the construction of the cross-State line. I believe that the disability is shown by the comparisons that I have cited. In other words, at the present time we are at a very distinct disadvantage in trying to do business with communities such as Crane and in that territory strictly within our own borders, and that would be largely remedied, I believe, by the building of the line across the State. It would bring us closer to the entire territory, allow us to compete on a fair basis, at least, with Salt Lake City and Chicago, and of course in that way we would be greatly benefited. But I believe that we would be greatly benefited also by the development of the territory that will be served by the line, the natural development that would follow the construction of such a line.

Exam. ROGERS. Do you come in contact with various shippers Mr. Curtin?

A. Yes; in Portland. (2188.)

Exam. ROGERS. What is your general experience as to whether shippers route their own shipments or leave it to the carriers?

A. They usually route their own shipments; that is, the shippers who are members of our organization.

1181 Cross-examination:

The shippers of my organization generally route their own shipments; I have discussed it with many of them at various times in the performance of my duties in the organization. That is one of the functions of a traffic manager. I am daily in contact with the traffic men of my organization; in fact, on every Wednesday we have a noon luncheon, at which different traffic problems, minor ones, such as routing their freight and things of that kind, are discussed. They all knew, before discussing it with me that they had the right to route their own shipments and the advisability of routing their own shipments. As to whether it has ever been exercised in Portland by the routing of any shipments, to speak of, off of the Southern Pacific (2189) rails to the Columbia River route, I don't know that any of our members have had a great many shipments coming off of the Southern Pacific going east. I have not discussed any such shipments with them, however.

The members of my organization are largely Portland jobbers and manufacturers. I have never discussed any routing from points on the Southern Pacific east of shipments that my members were making, so I am not aware of any shipments that they make from points on the Southern Pacific.

As to shipments originating on the Southern Pacific lines, like the branch lines in Yamhill County and Tillamook County and being routed Southern Pacific via Roseville to Ogden instead of routing some of them through Portland via the Columbia River route of the O.-W. R. & N. and the Union Pacific (2190), I dont know of course just what is being routed from there, but I know that this might happen: If a bill of lading were tendered to the Southern Pacific bearing the routing Southern Pacific, Union Pacific, the Southern Pacific very likely would turn it over to the Union Pacific system at Ogden. It may be some sort of laxity on the part of the traffic man, or the traffic man at Tillamook
1182 may have no particular choice in routing that particular shipment and route it in that way. I don't know, of course, what the reasons are down there for routing it over the Southern Pacific, I can't answer, and as to its holding to the Southern Pacific rails, I am not fully familiar with the way that that traffic is moving. I believe that the bulk of the traffic generally in western Oregon from points on the Southern Pacific is going south, but I don't know. I had the impression that there was a considerable tonnage moving west over the O.-W. R. & N. and south over the (2191) Southern Pacific of transcontinental tonnage, but I haven't any figures available on that and could not testify with intelligence.

As to the switching line and industrial track of the Southern Pacific, they have a yard on the east side of the river, but they also have their switching done by the terminal company on the west side, which is the same switching company that switches for the O.-W. R. & N. on the west side. The East First Street track of the S. P. is in east Portland yards. I don't know of any one on the East First Street who are members of my association, unless it is Mitchell, Lewis & Staver and Bell & Company. (2192.)

As to whether the Southern Pacific will turn traffic over to the cross-State line proposed, turn it over, now, at Crescent Lake, if it failed and refused to do so at Portland and has succeeded in holding its western Oregon traffic to its own rails, my understanding of this complaint is that the question of joint through rates and traffic arrangements is before the commission in this proceeding, as well as the building of a line across the State; and it is my understanding that those rates and joint traffic arrangements made in connection with the cross-State line are to be taken care of here. I believe that if joint traffic arrangements made in connection with the cross-State line, that the people in western Oregon now located on the
1183 Southern Pacific that are supporting this cross-State line will see to it that their traffic is routed over that line to a certain

large extent. I don't think, that the question lies entirely with the Southern Pacific.

As a practical matter and as to it being a pretty poor railroad agent serving a given territory that can't hold the bulk of his traffic to his own line, if it reaches the destination, I would say also that the solicitors serving that country or that territory would be considered by their superiors rather poor solicitors if they could not get their share (2193) of their business there also, off of a foreign line.

Q. Are you advocating here the building of another route across central Oregon in the face of an experience that has shown the inability of a competing line to get the business at Portland? Are you advocating an attempt to overcome that experience by stationing traffic solicitors all through the Southern Pacific territory in western Oregon by the Union Pacific?

A. I don't know as I quite understand your question, but if you mean are we trying to overcome the inability of the O.-W. R. & N. to get the traffic here at Portland by the building of that line, I would say that it is my opinion that with the building of that line, if it was done by the Union Pacific system, it would put the Union Pacific system in a much better light in the valley, and that they would naturally get a heavier tonnage out of that territory than they are now getting via Portland.

As to whether I think the Union Pacific should go in there and experiment with the proposition and see whether they can convert the people of western Oregon to change the practice they have been following for years, I had not suggested the Union Pacific in my testimony as the line to build the road, but whichever line it is that builds across there would naturally, in my opinion, be in a position to demand a certain amount of that traffic—not to demand it,
1184 but to control it, say through solicitation and the good graces of the people.

The Southern Pacific operates through a timber belt here in western Oregon. They serve practically all the mills in Oregon, south of Portland and in the Tillamook Country. I believe it is the practice that they place orders for timber, lumber products for their cars, for their own necessities and for their ties, they buy from mills on their own line. As to its being delivered on their own line and they or the shipper pays no freight rate, I don't believe that that is the fact in the purchase of lumber. However, I would not want to say yes or no to that (2195), Mr. Spencer. Here is the idea that is in my mind: That is, that when the Southern Pacific, or any other line buys, we will say, car material in the western territory here, that that material is all billed on commercial billing. Now I may be wrong on that. That is why I say that I can't answer yes or no to your question, because that is the idea that I have in mind, and I have nothing further than that idea to support it.

I believe that there is billing and transportation charge for lumber purchased by the Southern Pacific on its own rails. Assuming that there is not, and they take delivery at the mills that are on their

railroad, if the O.-W. R. & N. buys company material loaded on company cars at Booth-Kelly in Lane County, at Springfield, it has to pay a freight rate into Portland, so on that particular commodity, the railroad that can buy local to its own rails has the advantage (2196) and as a matter of reciprocity, the mills that make these sales to their own railroad and can't make them to a competing railroad, will give their business, to the railroad that purchases from them. They do so largely, but not entirely.

There is some milling in transit arrangement of logs. I am
1185 not as familiar with lumber and the log rate structure as I might be, as we have no lumber mills members of our organization and I have not had occasion to go into that rate structure for a long time.

Commodities that I mentioned as moving to Crane over on the line from Ontario into Burns, are those I thought would move into a territory of that kind and are those that are commonly used in any territory. In connection with that commodity, structural steel, I know (2197) there have been two contracts that our people here in Portland have lost because of this rate structure at Burns. I said at the start of my testimony that I used Crane to illustrate the rate situation in that territory, and that the rates to Burns were standard arbitraries over the Crane rates. I don't know what the two contracts referred to were for, they were separated probably by a period of a year. I don't know where the equipment for the so-called Herrick mill built at Burns was purchased.

As to whether there would be any reason for making a rate for Portland if it should happen that that rate into Burns was made for the particular purpose of enabling the movement of that tonnage into Burns, if there was not to be any other steel go in there: There seems to have been a reason for making a rate from Salt Lake. If we are going to move it in (2198), we do not necessarily have to grade the rate through. These are carried in separate tariffs, and if there was a reason for making it from Salt Lake, there is just as much reason for making it from Portland. As a matter of fact, I don't know that the only steel that has been shipped in there, and the only demand for it, was for the construction of that mill. I have never been over at Burns or Crane. There has been demand for rates on structural iron as commodity; the last demand made probably a year and a half ago. I personally requested it verbally of Mr. Edmonds, the traffic manager of the O.-W. R. & N.
1186 Company. As to why I didn't make a written request for it (2199), the contract had already been lost, and Mr. Edmonds made the remark that he didn't see any necessity for making the rate at this time, but if any other contracts come up there later, if the party that wanted to ship in there would take the matter up with him direct he would try and make a rate that would be satisfactory to them. That, of course, is always unsatisfactory, because of the fact that when bids are called on a job like that it requires rather prompt action.

The other commodities mentioned in this statement were canned goods. I took the rate from Chicago out of Union Pacific Tariff 3040–B. I have no personal knowledge of a carload of canned goods moving into Burns or Crane. (2200.) Those rates into that branch, or any other branch on the main line, would not necessarily be within the rate to the coast. The same principle is through here. If that were a fact, why should the rate from Portland into Salt Lake be carried into that branch line? It hasn't been.

Q. Well, it may have been an oversight; but you have got a transcontinental tariff here—well, has there been any request for a carload rate on canned goods into Burns or into Crane, or any movement?

A. I haven't made any, to the carriers. I would expect carloads of canned goods to go into that territory and believe that there are. In that territory I believe they could consume a car of non-intoxicating beverages. That includes quite a few of the soft drinks, and I believe that they would be brought in there in carloads and distributed among the smaller communities. Boise is the jobbing center for that territory on some commodities. I don't know just on what commodities. (2201.)

1187 Q. Well, they had a rate hearing on the rates into that territory before the Intertate Commerce Commission, didn't they, here a few years ago, and Baker had the same rate as Boise, and the Commission graded the rates so that Boise obtained the advantage, and Boise serves that territory, isn't that right?

A. I presume that Boise serves that territory on the commodities that it jobs out of Boise or are manufactured there. It would have a rate advantage. But you will notice that the comparison is made here between Portland and Salt Lake on that particular commodity, and the rate on beverages from Salt Lake for 574 miles, 89 cents, and from Portland, 558 miles, $1.18½. Those comparisons were made Mr. Spencer, not to show the reasonableness of the rate structure out of Portland, because that question isn't before the commission here, but to show just how far distant Crane is from Portland. Now, when it can be compared with Chicago on your beverages, 1,955 miles, a rate of $1.05 from Chicago, 50,000 pounds, or $1.21, 30,000 pounds, as compared with the rate from Portland, 558 miles, $1.18½, 36,000 pounds—that's the purpose of those citations. The relation this has been to the construction of a cross-State line is that it shows the remoteness of a city in the State of Oregon (2202) from the industrial centers of its own State, and shows that under your commodity rate structure as shown in these citations Crane is just as far from Portland as it is from Chicago.

Q. Well, now, you know, if these are not mere paper rates, where you point out that disparity and you need a readjustment of the rates, you have recourse before the commission to obtain it, do you not?

A. That is why I say it isn't the reasonableness of the rates that they were introduced here to show.

Exam. ROGERS. An illustration to amount to anything would
1188 have to be on the theory that the present rates were reasonable, would it not? If the present rate is unreasonable, doesn't your illustration fall? Suppose the present rate is too high?

A. Suppose the present rate is the fifth class rate to Portland.

Mr. SPENCER. You are comparing commodity rates and class rates——

A. I am comparing the rates on structural iron and steel, with the other commodities from Portland, with that rate in effect from the same commodity from other territory.

Q. But you are comparing commodity rates from the other territory and class rates from Portland.

A. That is the way rate structures go, Mr. Spencer. (2203.) That is the way the rate structure is built as I have determined it and have ascertained from inspection of the tariffs. As to there being no complaint or request for the checking in of commodity rates from Portland: I have made that request myself, on structural steel, after the contract had been let. (2204.)

J. P. NEWELL thereupon resumed the witness stand, and testified further as follows:

Direct examination—Contd.

I was asked by Examiner Rogers to make some calculations of cost, using as a basis three mills per gross ton-mile and I have; the computations I made are on three typewritten sheets.

(A statement heretofore marked for identification "Complainant's Exhibit No. 34, Witness Newell," was thereupon (2205) received in evidence.)

In explaining what results were obtained by using that formula and basis, I repeated the calculation which is made on page 111–a
of Exhibit 16, the typewritten sheet introduced there, using
1189 the suggested rate of three mills per ton-mile as the measure of the cost of the operations indicated under each subheading, and comparing them with the rates earned by each carrier. The exhibit I think speaks for itself, in the main, but it shows that under the haul by way of Alturas with the existing rates, at three mills per ton mile the Southern Pacific would make $88.44 and the Union Pacific on the haul from Ogden to Omaha would earn $17.43, this being 1.76 cents per mile.

If the haul were made by Crane, the Southern Pacific's cost would be $16.13, and adding the same net as above would show that it would require $104.57 in order to have the same net. On the balance remaining the Union Pacific, with the cost figured the same way, would make $54.22, or 3.27 cents per mile, that showing for the proposed route being somewhat more favorable than that which

I have shown where I figured the cost by the methods indicated in Exhibit 16. If that car of lumber goes beyond Omaha, so that the earning (2206) as divided between the carriers is less, I find that the Union Pacific, figuring its cost at the rate of three mills, would lose $5.32, and taking it from Crane would make $31.47.

I introduce one other calculation there which I didn't put in the Exhibit 16 on page 111–a. That is on haul from Klamath Falls, because I didn't claim that it was practicable to make that kind of a traffic arrangement for that point, permitting the Southern Pacific to make as much on that very short haul as it could on the haul through Alturas, but I put a similar calculation in here. Because it indicates on this basis of three mills the same condition of loss by one of the carriers under the existing rates.

Exam. ROGERS. Did you find any basis for the three mills, Mr. Newell, or did you look for it? (2207.)

A. I didn't look for it. I didn't think that any flat rate could be applicable, at least in this western country with the moun-
1190 tains intervening in so many places affecting the cost. If you will note here, if you compare my figures in this exhibit with those on page 111–a of Exhibit 16, it shows that the figure of 3 mills is too low for the Southern Pacific and too high for the Union Pacific.

Exam. ROGERS. Well, that may be, but I think in a case I had in mind where the carriers used the figure—I think the exact figure was 3.026, as I recall, and some of the carriers, the Southern Pacific and the other lines, said that was applicable on a whole from California to Chicago. I am not certain about that.

A. Well, it might be on that long haul, with the level grades and the fact that you would have the down grades as well as the up grades introduced in it. In this case, you see, the haul on the Southern Pacific was from low ground to the top of the mountain, or at least somewhere near, to a high elevation, where the Union Pacific takes it and hauls it to a low elevation, so the grade is against the Southern and in favor of the Union. (2208.)

Q. Had you finished what you wanted to say in explanation of sections three and four of this exhibit? I think you had just started and wanted to finish.

A. I think I had finished that. I put in some calculations from Klamath Falls on pine lumber; they show on this same three-mills rate that there would be a loss to one carrier, the Union Pacific. By taking the traffic, figured on this same basis of cost, via Crane, as far as the loss is concerned, it would be converted into a net earning. The results this method of computing these costs as shown on Exhibit 34 produced, so far as it may have tended to confirm or otherwise the results reached in using my own basis of ascertaining costs; it confirmed the same general relations between the costs and the earnings by the two proposed routes. (2209.)

I made a similar approximate check by the use of operating ratios for the purpose of testing the results obtained by my own
1191 basis from the standpoint of operating ratios, and with the addition of constructive mileage I found the same confirmation of the general relation between the rates and the cost.

Comr. McMANAMY. Exhibit introduced by Mr. Newell was 34, and this will be No. 35.

(Said statement was thereupon received in evidence, marked "Complainant's Exhibit No. 35, Witness Newell."

In explaining briefly what I did here and what results I ascertained, I took the operating ratios of the carriers as shown by annual reports, I allowed constructive mileage to the Southern for origination, and to the Union for delivery and to the Southern for its heavy grades on the Cascades and on the Sierra Nevada Mountains. The figures are all set out here. The calculation is of the same nature, except that I (2210) used the haul via Roseville and the operating ratio in order to obtain for the Southern Pacific a cost per mile, per car-mile, that is to be applied to the haul by way of Alturas.

With that explanation, I think the whole thing can be understood without any further comparisons. The net result is to show approximately the same condition, that is, that the Union Pacific under this method of figuring cost could have better earnings per mile on on the haul from Crane without reducing the Southern net earnings in total amount. This last computation I spoke of consisted of two pages.

Exam. R[illegible]s. Mr. Newell, as to Exhibit 34, you said you didn't believe the three mills was a proper figure. Would you mean that some other figure might be applied, or did you mean that it just couldn't be done by that method?

A. I don't think it can be done by that method. I think the cost is too variable to permit of one figure being taken as applicable to all the hauls.

1192 I, likewise computed, the cost, the direct cost, of moving a car of fir lumber from Eugene to Omaha via the Portland gateway. (2211.) That computation is contained on one sheet.

Q. That is the third sheet of the bunch I just handed around. It is entitled "Car Fir Lumber, Eugene to Omaha via Portland, 56 Tons"; I would like to have that received as Exhibit 36, please.

(Said statement was thereupon received in evidence, marked "Complainant's Exhibit No. 36, Witness Newell.")

The only thing that I need to call attention to on this sheet is how the cost via Portland compares with the cost between the same points via the two other gateways shown. Those two comparisons are shown at the bottom of the sheet, showing that that via Portland is slightly less than it would be via Alturas, but considerably more than it would be via Crane.

Q. Then that would indicate that for the movement of lumber from Eugene to Omaha or points east of Omaha, there would be

no saving by shipping via the Alturas route when it is completed in comparison with the existing route via Portland?

A. The cost to the carriers wouldn't be less.

The summary on the bottom (2212) of 36 is supposed to represent cost to the carriers, the direct cost. I have indicated in my Exhibit 16 the economies in the handling of the existing traffic between Ogden and western Oregon by the use of the proposed cross-State line in shortening distance and in consequently reducing expense. In citing, in this connection an instance of a very considerable investment authorized by this commission for the purpose of reducing expenses, I have at hand a quotation from the United States Daily, quoting the Interstate Commerce Commission as granting authority to change the route of the Great Northern in Washington, near Leavenworth—where they built 15 miles to reduce the maximum grade from 2.2 to 1.5 per cent, eliminating 1,285 degrees
1193 of curvature, shortening the line one mile, at a cost of $3,631,000.00, estimated saving of $200,000.00 a year in their operating expenses—pardon me, that is not a correct statement—an increase of $200,000.00 per year in their net operating income. I take it that the saving is partly in other things than the direct operating expenses in some manner.

Exam. ROGERS. I want to ask a question or two about Exhibit 16, Mr. Newell. As I understand it, part of the material or basis for your Exhibit 16 was also used in the grain case.

A. Yes; my study of the costs on the Oregon-Washington Railroad & Navigation Company.

Exam. ROGERS. What I was wondering about was to what extent in so far as your Exhibit 16 is concerned, are we basing on the correctness of the same matter in this proceeding that the commission will pass upon in the grain case?

A. Only in so far as figures on direct cost are concerned, the derivation of unit costs. In that case the same unit costs were applied to different hauls of another commodity, and there was introduced calculations of indirect cost and return on investment to make up the total cost to be compared to the charges made for the haul. In this case, I have made no corresponding calculations of indirect cost and return whatever. (2214.)

PORTLAND, OREGON, *August 15, 1928.*

J. P. NEWELL thereupon resumed the witness stand, and testified further as follows:

Cross-examination:

In opening my presentation by Exhibit No. 16, on page 3,
1194 in referring to the proposed extension of Union Pacific Railroad from Crane to Crescent Lake, I meant the extension of the Union Pacific system. That line there, I believe, is owned by the Oregon-Washington Railroad & Navigation Company, but operated by the Oregon (2216) Short Line, both of which are parts of the Union Pacific system. I was thinking of it as system rather

than Oregon-Washington Railroad & Navigation Company. I had in mind the railroad of the Oregon-Washington Railroad & Navigation Company extending from Ontario Junction to Burns. In my synopsis on page 7, speaking of the distance from Eugene, a central point for western Oregon, my study is made upon the premise of Eugene as the railroad center and commercial center in western Oregon.

Comr. McMANAMY. Mr. Newell, before we get too far away from that other question, where is the eastern terminus of the Oregon-Washington Railroad & Navigation Company?

A. As an operating unit it is at Huntington. Now, I don't know just what the ownership arrangement is whereby they——

Comr. McMANAMY. Ontario is east of Huntington, is it not?

A. Thirty miles east—forty miles east of Huntington.

Comr. McMANAMY. Is Ontario located on the line of the Oregon-Washington Railroad & Navigation Company?

A. It is not. It is on the line of the Oregon Short Line.

Comr. McMANAMY. And is the extension from Ontario to (2217) Burns and Crane an extension of the Oregon-Washington Railroad & Navigation Company lines?

A. Not by any physical connection. I am not sure as to the arrangements of ownership. I understand that the Oregon-Washington Railroad & Navigation Company does own that line. I don't know how it is when it isn't connected.

Comr. McMANAMY. I didn't understand it in that way.

I worked for the Oregon Railroad & Navigation Company
1195 as an engineer for a number of years. The eastern terminus of the main east and west line of the O. R. & N. Company, the Oregon Railroad & Navigation Company it was then, was and is at Huntington. (2218.) The Oregon-Washington Railroad & Navigation Company is a successor to the Oregon Railroad & Navigation Company. As to whether it acquired the properties of that company and of other companies, my knowledge of that is confined to newspaper reports, and so forth; that is my understanding that they did. I have seen the maps of the lines of the Oregon-Washington Railroad & Navigation Company repeatedly and would recognize one if it were presented to me. I have been over the line repeatedly, both through my relations with it as an official and as a citizen and as a rate expert. I have had access as an engineer for the public service commission to its books and accounts on several different occasions during recent years. I recognize those lines of railroad as the lines of the Oregon-Washington Railroad & Navigation Company's system in the States of Oregon, Washington, and Idaho on the map you hand me, bearing the legend, "Union Pacific system (2219) lines of the Oregon-Washington Railroad & Navigation Company"; with the exception that I am not familiar with the showing of the line from Malheur Junction to Burns as being a part of the Oregon-Washington Railroad & Navigation Company. It is a matter in which I hadn't interested myself at all. It wasn't a part of it when I worked

for the company, and, while I have understood that it was owned by that company, I didn't consider it of any importance here, so I have just been thinking of it simply as a part of the Union Pacific system. It is my understanding it was under lease to the Oregon Short Line and operated by it. I didn't take any pains to verify it; I didn't think it of any importance.

(Said map was thereupon received in evidence, marked "Defendants' Exhibit No. 37, Witness Newell".)

1196 As given on page 7 of my exhibit, the distance from Eugene to Union (2220) Pacific points east of Granger would be 429 miles less than by the present route through Roseville and Ogden. By the present route through Roseville and Ogden I mean the route of the Southern Pacific Company from Eugene via those gateways.

I happened to take Granger because that is the point of junction with the Short Line and the Union Pacific, and all comparative distances to points beyond that would be the same difference. In other words, the Southern Pacific interchanges with the Union Pacific Railroad Company at Ogden.

I supposed the western terminus of the Union Pacific Railroad Company was Ogden itself. I don't know the exact technical point. The Oregon Short Line Railroad Company connects with the Union Pacific Railroad Company at Granger, Wyoming. I do not know of any terminus of the Union Pacific Railroad Company west of Ogden. I have said Burns will be brought 160 miles nearer to (2221) Portland by this proposed cross-State line. This mileage is computed on the assumption that an operation by the railroad now terminating at Burns across this proposed cross-State line to Portland would proceed through Crescent Lake and thence via the Southern Pacific to Portland.

I didn't take into consideration an operation via the cross-State line from Burns or Crane and thence via the Great Northern to Bend and thence by the O.-W. R. & N. to Portland. That would be slightly longer than by way of Eugene. I said Boise, Idaho, will have the distance to San Francisco made less than the present route through Ogden by 273 miles. That reference was made in the consideration of southwestern Idaho territory and its business relation to San Francisco or San Francisco Bay points.

1197 I did not make reference to the Rogerson-Wells line because it is my understanding that it is so little used as not (2222) to be a factor in the case. I obtained that understanding from common talk with Idaho people, showing as regards the traffic that moves over the Rogerson-Wells line. A computation to determine how much further it is by the Rogerson-Wells line from Boise to San Francisco Bay points than it may be or will be if the cross-State is projected from Crane to Crescent Lake and thence you make a connection with the Southern Pacific, shows from Boise it will be 90 miles further by Wells than by the use of the cross-State line, on a haul of some 850 or 900 miles. I have the mileage figures from Ontario before me, not from Boise.

Q. You say that the crucial point in this case is the possibility of justly requiring the Southern Pacific to interchange traffic originated by it in western Oregon with the Union Pacific at the proposed junction. You would not assume that the cross-State line would be justified, or should be required, if the western Oregon traffic is not to be routed over that line—by western Oregon traffic that I mean, of course, traffic east and west to western Oregon? (2223.)

A. I think that is true.

My study proceeds upon that assumption, to analyze and take transportation costs as you estimate and determine them that would attend the transportation respectively via the cross-State line, via Roseville-Ogden line, and via the Klamath Falls-Alturas line.

I did not take into consideration in this study, Exhibit 16, the Columbia River route of the Oregon-Washington Railroad & Navigation Company as another route for western Oregon from Eugene. It has been supplemented by the exhibit which has been introduced yesterday. In the analysis brought in yesterday, that also proceeds from Eugene.

There is a greater volume of tonnage, as I recall the figures of traffic of western Oregon, or originating in western Oregon, in the counties north of Eugene than in the counties south of Eugene;
1198 out of Lane County through Ogden than out of any (2224) other county. Next to that, I think, is Linn. I would answer your question this way, that the greatest density is in Lane and the counties immediately adjacent to it. There is considerable, both north and south, but mostly north. (2225.)

As to observing the traffic density and development reflected by the exhibit of Mr. Wiggins: I don't know the number, but Mr. Wiggins collected that information and, after consulting with me, arranged it in the form in which it was presented and which I have used.

As to whether the cross-State line could not be sustained or justified unless it was supported by this western Oregon traffic, particularly since Klamath Falls and Bend are practically eliminated from this operation; I would not consider Bend eliminated. I have admitted that Klamath Falls would be practically eliminated with the construction of the Modoc Northern, but certainly not Bend.

As regards a compulsory connection at Crescent Lake, I would say yes to your question; not as regards possibly an extension, a line direct to Bend itself. I have not studied it in order to answer that question, but my presentation is all based on the assumption that there will be such a division of traffic.

On page 9 in this manuscript, the traffic is divided into direct and indirect costs and I explained these two different characters of cost in the exhibit. (2226.)

Q. But you say in that connection, "Indirect transportation expenses, therefore, would ultimately disappear." I am reading from page 10, "if it were not for the fact that, with a growing system, the process is repeated with each addition to the mileage so that

although these expenses are entirely direct on one part of the system, they may be largely indirect on other parts." Now, I am wondering how indirect cost of transportation could possibly disappear. I understand indirect costs are costs, speaking generally, that do
1199 not result from direct physical operation of the property?

A. Correct.

Q. Now ties, the trestles——

A. Will you pardon me for interrupting you. I see that you have overlooked the meaning of transportation expenses. I am referring to that class of expenses in the accounting system which is called transportation, and has nothing to do except with train operation and stations, and so forth. It does not include maintenance of way——

Exam. ROGERS. That is just the transportation block of accounts?

A. Yes; that is just the transportation block of expenses. (2227.) That is, those accounts are promulgated by the accounting rules and requirements of the Interstate Commerce Commission and they come under the head of transportation expenses.

As to my analysis of these different costs and to what data and reference the information was ascertained: The use of the unit costs is explained here, the reason for certain modifications of them and the adoption of certain ones. I have used only the operating accounts of the Southern Pacific Company as found in their annual report. I did not go into that any further than that. Those are explained on page 61. This study starts with an analysis of the operating expenses of the Oregon-Washington Railroad & Navigation Company (2228) in 1925.

Q. But the Oregon-Washington Railroad & Navigation Company is eliminated from the operations that you have in mind, and subsequently present with the resulting costs or direct costs on the through routes that you discuss, namely, the cross-State line, the Klamath Falls-Alturas line, and the present Roseville-Ogden line. Now wherein will the O.-W. R. & N. study and analysis assist you, or wherein is its use justified as a basis for these other calculations?

A. It enters directly in the calculations which I present from Bend, which are rather an important factor in the whole situation. It gives me a study of costs in Oregon, and the Southern Pacific line is, in Oregon, subject, in many respects, to similar condi-
1200 tions. It gives me a basis for comparison with the Short Line. I make a similar study of the Short Line and comparison of all the figures found in their operations enables me to arrive at more satisfactory conclusions as to unit costs on both lines, and, therefore, I consider it of use in determining the unit cost to be used in this entire question.

I didn't make a study for the Public Service Commission of Oregon in 1925 of the Oregon-Washington Railroad & Navigation Company's operations, I used 1925 figures for this study. (2229.) I filed an exhibit or a report with the Public Service Commission of Oregon, entitled "Report on Railroad Extensions to Serve Short Line

and Central Oregon," and dated 1925. That did not involve any complete study of the O.-W.; only some revisions and extensions of my own former study. In connection with that report, the cost was determined, per car-mile for the respective divisions of the O.-W. R. & N., particularly the first division on the Columbia River from Portland to Umatilla, and some such comparison was made as to the direct cost per car-mile for moving the business over the second division through Umatilla and Messner to Huntington. (2230.) The figures on page 35 from main line alone the cost on the first division would be 9.78 cents per car-mile, and on the second division 12.79 cents.

I did not make any comparison of that kind for any part of the Southern Pacific operations in western Oregon, or undertake to determine what they might be on the cross-State line on the same basis. The figures which I give would enable one to take that, and by a very brief calculation, to obtain the same corresponding figures. In other words, if we take the exhibit I introduced yesterday, the O.-W. R. & N. Exhibit No. 36, you would be able to make a comparison via the entire Union Pacific route from Portland to Omaha, and of the cross-State route from Eugene to Omaha, and of the Southern Pacific route to Omaha, but you would not be able to
1201 make any comparison as between Portland and Ontario, on the one hand, and Eugene and Ontario on the other, via the cross-State line.

Exam. ROGERS. Mr. Newell, what was the purpose of this 1925 study to which Mr. Spencer refers?

A. That had to do with the application of the Northern lines for permission to extend their lines to Klamath Falls, and, in that connection, the Public Service Commission presented some figures showing approximately these relations of cost of transportation by way of the cross-State line.

Mr. SPENCER. No; this 1925 study was on a petition for rehearing before the Interstate Commerce Commission, wasn't it?

The WITNESS. You will have to ask——

Mr. DEY. That 1925 study, Mr. Newell, was introduced as Exhibit No. 56 in the record of the Klamath Basin Cases, Finance Docket 5111 and four or five other dockets, heard at the same time before Director Mahaffie, in October, 1925. I think you introduced that as an exhibit, did you not?

A. I did; yes. I appeared there as a witness for the Public Service Commission, the Public Service Commission of Oregon, having intervened in those cases. (2232.) The Public Service Commission wished to have the cross-State line kept in view as a part of the necessary solution in that case, and in order to make such figures as I could, in the time that I had to present that, I took my former study made in the Columbia Basin Rate Case, in 1919, and, by certain modifications, applied some of those figures to cost across the State. I do not consider that at all as reliable as the figures which

are now presented, and in making the analysis which I now have I did not use this at all, and therefore I am not up on the exact figures that are in that; I don't recall them in all cases.

Q. Now your operating expense on the cross-State line is arrived at by assuming that there will be a 56-car train loaded, and that the operations will be comparable to the operations of the Oregon Short Line Railroad Company main line; is that right?

1202 A. Most of the unit costs used for the cross-State line are the same as for the O.-W. I used train mile and car mile cost as exactly the same. For the gross ton mile, which is practically a maintenance-of-way figure and covers most of the maintenance (2233) of way. I took the Short Line, and for resistance cost I took an intermediate between the O.-W. R. & N. and the O. S. L. That is explained on page 62. On page 64 I state, "The average number of cars per train on the O. S. L. main line was 46.3, but if I assume that one-third of the main line train-miles were way freights and that they averaged one-half as many cars as the through freights, then the latter must have had 56 cars each, which I take as the average through train for these calculations." I wanted to use 56 if it was justifiable, because I had used that previously on the O.-W. I would not figure on much way-freight service on this cross-State line to begin with at least.

These calculations of direct cost gives the total cost Eugene to Ogden $220.90 and Ogden to Omaha $149.50, which gives a total of $372.40; and from Eugene via Alturas (2234), that cost on the unit from Eugene to Ogden would be reduced to $174.40.

My figures show that it is more expensive to operate out here on the west end than it is on the east end, and when figuring the cost from Eugene to Omaha via the Crane line I do not use the same factors all the way through; I use the same figures for the Union Pacific that I have for the O. S. L. both ways. Practically all these calculations are based on lumber tonnage; all that you have so far considered. There are some on other commodities. In the main it is lumber which constitutes something like 82 per cent.

I have shown at certain points here where the operation is conducted at a loss. (2235.) Even on the Union Pacific; and in the same connection that it was conducted at a profit on the Southern Pacific. I don't know why it is, but I think it quite evidently is.

1203 I obtained from Mr. Wiggins and Mr. Curtin the rates applied to "Car pine lumber destined beyond Omaha"; as found on page 115.

Q. Yes. Now you have a net loss on the Southern Pacific from Klamath Falls to Omaha via Roseville of $7.41 and of $27.21 via the Union Pacific; and yet, as I understood you yesterday, in response to a question from the examiner as to the use of the three mills to cover direct transportation, you stated that it would be too high for the Union Pacific and too low for the Southern Pacific. Now if the divisions are as applied on this under existing conditions

as illustrated by this item, I (2236) have called to your attention, would you regard the application of the three mills too high for the Union Pacific and too low for the Southern Pacific?

A. Well, my figures of cost show for the Union Pacific less than three mills per gross ton mile on a car of fir lumber. Now I didn't check it out on the pine lumber. And my question perhaps yesterday, or my answer, ought to have been limited to fir lumber, which is what was under consideration at that moment. It would not apply necessarily to pine lumber, a lighter load. (2237.) But the divisions are such that the originating line, the Southern Pacific, obtains a larger percentage than the Union Pacific, and with that arrangement the transportation haul is more profitable to the Southern Pacific than it is to the Union Pacific, particularly from Klamath Falls.

As compared to figures which I found, my own figures of cost in Exhibits 34, 35, and 36, show the Southern Pacific haul from Eugene to Ogden cost them more than three mills per gross ton mile to Ogden, and those for the Union Pacific from Ogden to Omaha as costing a little less. In all cases that is direct cost. I am not talking of anything else here. I have that right before me, the cost on fir
1204 lumber (2238) from Eugene to Ogden was 3.17 mills. That is a note which I myself have made, you will find it on page 111-A, the totals. I merely introduced the calculation. For the Union Pacific from Ogden to Omaha, 2.7 mills per gross ton mile on fir lumber. Both costs would be higher on pine lumber, with that pine loading. Pine lumber loads much lighter than fir. I have taken the records of loadings out of the county as furnished me by the Southern Pacific. As to loadings on pine averaging about as heavy as they do on fir; my understanding is, about the same number of feet, and it being a lighter weight lumber the carloads are much lighter.

Q. Yes. Now, you have referred to page 111-A of your Exhibit 16, and you have a net cost per mile—no, this is the earning per mile here, isn't it, this fraction——

A. Yes; I have the costs per mile noted in my own copies.

Q. I see. Now, referring here to Exhibit 34, via Alturas again, that originates—the first item there on the first page of Exhibit 34—you are starting, now, from Eugene, a (2239) carload of lumber, as I understand it, fir lumber. Your earnings for the Southern Pacific to Ogden were $235.75.

A. Pardon me, that is a typographical error. That should be $253.75. You will notice the net earnings indicate that "235" isn't right. The figures are transposed.

In determining the earnings of $253.75, I have stated in my study here that I assume that the divisions between the Southern Pacific and Union Pacific would be made on the routing through Alturas and this would be the same as on the routing through Roseville. At $253.75 I deducted the cost in this case (2240) on the three mills basis and have a net earning of $88.44. The haul to Omaha is

$183.75. The cost is more than the cost of the haul from Eugene to Ogden, naturally; it is six miles farther. As to whether the distance of six miles shouldn't make much difference if it is
1205 very much more favorable for operation: Well, this takes no account on the three mills per gross ton mile. My own figures take account of that difference. There is a difference there of $17.43, the net earnings on the Union Pacific. In saying that the three mills is too low for the Southern Pacific and too high for the Union Pacific, I say that as shown by my own calculations of cost it doesn't cost the Union Pacific quite three mills for that (2241) haul, and it does cost the Southern a little more than three mills for its part of it.

Exam. ROGERS. Is that because of operating conditions occur[r]ing on one compared with the operating conditions occur[r]ing on the other?

A. It is taking in all conditions. For instance, in this State there is a train operation law that requires a bigger crew in this State than in other States, and there is lower cost of fuel on one than on the other, and the Southern has heavier grades than the Union Pacific. The additional mileage you go through Roseville would be a factor in that too.

On page 123 of my exhibit, the estimated net earnings that would accrue to the proposed route are discussed later as regards the cross-State line only. I assumed the cross-State line would cost (2242) nine million dollars and then I added a part for a share in the Oregon Trunk line, over which operations would have to be. By Oregon Trunk line, I mean the Great Northern.

Q. The Great Northern extended south of Bend. The Oregon Trunk didn't extend, did it?

A. I supposed it was still called Oregon Trunk, commonly spoken of as such.

Q. Well, the Oregon Trunk—I think the records show the Oregon Trunk filed the application, then withdrew it, for the extension from Bend to Klamath Falls, then the Great Northern entered into a contract for the use of the Oregon Trunk line and built the line from Bend to Chemult, and operates from Bend to Klamath Falls by itself.

1206 A. Well, then I should have said "Great Northern" when I have said "Oregon Trunk" in the description.

Exam. ROGERS. Well, on that point, Mr. Newell, did you assume that the line, if constructed, the cross-State line, would have no trouble in entering into an arrangement for the use of this line from Bend down to the junction?

A. I did.

Exam. ROGERS. Well, what difference would it make if they (2243) did—in your computation and concluding—if they did have trouble and couldn't enter into that arrangement?

A. Well, then we would have to introduce the cost of interchange at both of those junctions—the interpolation of another carrier, mak-

ing a three-line haul instead of a two-line haul. The junction point, or the crossing of the cross-State line with the line of the Great Northern Railroad south from Bend is approximately 53 miles and 18 miles north of Chemult.

Exam. ROGERS. I was just wondering how, in arriving at a conclusion in this case, we could proceed on that assumption.

A. The Great Northern took the position throughout the discussions in the other case that it was ready to grant such use of its lines on proper terms to any other carrier who might have occasion to use it, and such a stand was announced repeatedly, and I have no doubt is in the record, though I myself can't confirm it as being in the record, but I assume the attorneys can.

The line has been built now, and no common user condition has been imposed. I presume it would be a matter of negotiation between the railroads, the Oregon-Washington Railroad & Navigation Company on the one hand, and the Great Northern on the other, as to whether the Oregon-Washington (2244) Railroad & Navigation Company would be privileged to operate from Bend down to a connection with the Great Northern. I should have to leave that
1207 to the attorneys to argue. I don't know what the actual facts and procedure would be. I have assumed that the Great Northern would admit the Oregon-Washington Railroad & Navigation Company over that operation; over these rails, on the basis of assuming half the cost of the line involved. I didn't put it on a rental basis, I contemplated the sale of an undivided half interest in the line and equal joint possession and use of it by the Oregon-Washington Railroad & Navigation Company from Bend to the junction or their rental based on interest on such a cost. As to the interest I figured on: I said what I did was on the basis of actual ownership of one-half of it, and have calculated return upon that additional investment in addition to the cross-State line proper. (2245.)

I didn't find any record of the present investment to date by the Great Northern and its construction to base the cost on. I took certain estimates which they had presented beforehand as to what they had expected that it would cost. Those I obtained from the Public Service Commission. That estimate contemplated the use of that logging railroad of Shevlin-Hixon, for the first twenty-six or twenty-seven miles. I don't know whether they are rebuilding that now or not. I saw something about it in the newspapers. On page 139, I have the investment per mile from Bend for that 53 miles running down to connection with the Great Northern, including the purchase of the Shevlin-Hixon line at $1,816,000.00. That is for the 71 miles estimate. I don't know what the figures of actual cost of construction (2246) were, but that was taken from a copy of an exhibit sent me from the Public Service Commission, and was then marked "Exhibit E," and was presented by the Great Northern in return to a questionnaire. They stated that a three-quarters interest

in the Shevlin-Hixon line would cost them $375,000.00. I used the entire cost of $500,000.00 on the same basis, if this was three-quarters of it, and added that to the $1,316,000.00 which they estimated
1208 as the cost of the 47 miles from the end of the Shevlin-Hixon line to a point near Pauncona. I suppose the Shevlin-Hixon people would have to be reckoned with if they have an undivided fourth interest in 26 or 27 miles of that railroad.

Exam. ROGERS. I would like to ask another question, before we get so far from it in the record, and that is as to what traffic you had in mind when you told Mr. Spencer this morning that the cross-State line could not be justified without the western Oregon traffic, as I understand it, eastbound western Oregon traffic? (2247.) Now what traffic did you have in mind in making that statement?

A. That traffic which has heretofore been and is to-day moving by the Southern Pacific through Roseville and through Ogden and delivered to the Union Pacific at Ogden.

Exam. ROGERS. What I had in mind, did you have in mind that in addition to that western Oregon traffic that would, according to your assumption, move across the proposed line, the showing that has been made as to Idaho traffic westbound and the traffic that would originate on the line?

A. His question referred to the western Oregon traffic only, both in and out, and my answer referred to that, which—it is mostly lumber traffic, and the calculations of such traffic here presented are based first on the inclusion of the amount of traffic now moving, that is, as measured by the 1926 records, as moving to and from western Oregon through Ogden, therefore, traffic which passes over the Union Pacific at present and its natural growth as estimated and presented here plus those figures of natural growth which Mr. Teutsch presented as agricultural and animal product traffic.

Exam. ROGERS. Well, the question I had in my mind was whether your answer contemplated this situation, that the Idaho (2248) traffic and the traffic originated on the cross-State line might move over the cross-State line, but unless it got this western
1209 Oregon traffic the line could not be justified?

A. That was the intent of my answer, yes; I would doubt the justice of a compulsory building. In my computation here of net earnings for the proposed cross-State line I do include the lumber traffic now moved by the Oregon-Washington Railroad & Navigation Company out of Bend. I intended to confine my calculation to the fact that that pine lumber traffic now goes east, and always will go east, and it is that which did go east in 1926. My study disclosed that practically all of it went east. If it is routed east another competing road would share in the haul with the Great Northern, and unless we get a common user of the Great Northern's line, the Great Northern would haul it down to the junction. Then the Union Pacific would receive it on east from the Short Line, after it traversed the cross-State line (2249) and the Oregon Short Line.

I think the Oregon-Washington Railroad & Navigation Company would enter into a long term, burdensome obligation with the Great Northern for the use of the railroad from Bend down to its line, 53 miles, to junction with the proposed cross-State line, paying the fixed charges attending such an obligation, take on that additional maintenance and operating expense that is common to both carriers using the road, and then haul it by that route east, when it has its own line in there now and that is practically the only use that it has for its present line into Bend, if it took into account the relative costs of the operations.

It would hardly involve a scrapping of the line operated by the Oregon-Washington Railroad & Navigation Company in the Des Chutes Canyon. There would be other business, of course, to be considered. There would be distributing business from Portland going into that territory. The lumber isn't the only traffic. Of course, it is the preponderating traffic from Bend. It is practically the substantial traffic (2250) of that branch. I don't know
1210 what proportion it makes, but, as I recall it, it is at least 80 per cent.

In the expense for operation on the Bend traffic, I didn't take into account the investment in the Des Chutes branch. It would have no part of it. It is there to be borne whether it hauls any traffic or a great deal of traffic. I didn't know there is a joint operation there between the Oregon-Washington Railroad & Navigation Company and the Oregon Trunk Railroad, wherein to the owner of the line the Union Pacific's subsidiary, the Des Chutes Railroad Company, is obligated to pay heavy rentals for some nine hundred odd years. I haven't seen it. I know it is a joint operation for a very considerable distance in the canyon, and that the railroad pays a rental there of course. That is not taken into account. It is an expense that has to be borne regardless of (2251) this traffic. If this traffic can be handled by another route, at a reduced direct cost, there is more of an earning with which to pay all the expenses, whatever they may be.

Q. Now, I wonder whether you have figured that; if you don't know what that contract is and what the obligation of the Des Chutes branch is, how can you say that it is more economical to route it over the Great Northern and then return it to the Oregon-Washington Railroad & Navigation Company?

A. Simply because of the showing of the actual cost of operations over the two lines. I only show the direct cost; the other accounts aren't affected at all by the volume of traffic.

Q. Well, now, let's see. The cost of handling traffic is affected by the investment in the property, isn't it?

A. The cost—what you are entitled to recover in rates, of course, is affected by that, but the direct cost of handling the operations themselves don't include the investment, or the return on it, be-

cause those are independent of the traffic, you have to pay them anyway.

1210½ Q. I know, but irrespective of the tag that we may put on the burden encountered in moving the traffic, it is all there, isn't it? The taxes are there?

A. Certainly.

Q. The maintenance is there?

A. Yes.

Q. The increased train mileage is there?

A. Well, that is a part of your direct cost.

1211 Q. That is a part of your direct cost—but they are all in there. Now, you are going to handle this traffic that is now handled on the Des Chutes branch of the Oregon-Washington Railroad & Navigation Company, you propose the acquisition by the Oregon-Washington Railroad & Navigation Company from the Shevlin-Hixon Company and from the Great Northern Railroad Company of a property interest in 53 additional miles of railroad for the Des Chutes traffic.

A. Yes. There will be no other traffic of substantial volume over that 53 miles for the cross-State line except the traffic that the Union Pacific now enjoys, together with its natural growth, of course. In determining whether that would be profitable for the railroad to route it down the cross-State line, those elements should be considered. As to the fact that the investment is going, to all intents and purposes, be lost in the Des Chutes line and that there (2253) will be no further use for it: You couldn't say that. There certainly will be use for it. It will take away part of the traffic from it, of course. The Des Chutes traffic of both the railroads, to a large percentage is lumber; probably 90 per cent.

Exam. ROGERS. Mr. Newell, one more question about this western Oregon traffic. What is your judgment, in the event that a compulsory or voluntary traffic arrangement is not entered into between the Southern Pacific and the Union Pacific for interchange at Crescent, but assuming that the line is built and through rates established, do you think that the shippers can be depended upon to route their traffic over the cross-State line, notwithstanding that there is no traffic agreement between the carriers?

A. I think that the shippers would be entirely indifferent to it, except as it might be a matter of speed on shipments where time was an element to the shipper, and I presume there would be a good many cases where that might enter in.

1212 Exam. ROGERS. Well, do you think that that would be true on lumber?

A. I doubt if it would be important on lumber. It might be in some cases. (2254.)

Exam. ROGERS. Well, what would be the net result if there was no traffic agreement between the carriers, and the shippers shouldn't exercise their right to route their freight?

A. That would depend upon the interest the carriers thought they had in the matter. I have shown it is practicable to make joint arrangements profitable to both carriers.

Exam. ROGERS. Well, assume that the Southern Pacific routes over their line via Alturas or via Roseville all the traffic that they get, as they do now, what would be the result if the shippers don't exercise their privilege of routing their freight?

A. Well, the Union wouldn't get any. The cross-State line would be left without it. My understanding of the case is, though, that the petition is to the commission to establish such joint rates if they are not made voluntarily for such interchange.

Exam. ROGERS. Yes, but, of course, my question assumed that there was no voluntary or compulsory interchange at Crescent Lake. (2255.)

A. Well, then it would be altogether a question of the interest of the carriers that would govern their action, but it seems to me that the most profitable arrangement to both carriers would obviously be that interchange. It is quite conceivable, however, that one might insist on taking all the profit and prevent an agreement.

Exam. ROGERS. Well, my main inquiry was whether in the absence of an agreement by the carriers, whether they look at it in the same light that you do or not, the shippers would be depended on to route their traffic that way?

A. Well, I am not versed in that, but I would expect not.
1213 I don't think they would expect to take enough interest in the matter to insist upon routing via the cross-State line. I am referring there particularly to lumber. I think on some of the perishable products they probably would insist.

Exam. ROGERS. Well, to follow that one step further, suppose they did exercise the routing on perishables, but didn't on lumber, what would your net judgment be as to the justification for the line?

A. Well, I am doubtful. I wouldn't want to say that it wouldn't be justified. I haven't attempted to apply such a (2256) calculation, but my first thought is that it wouldn't be. Now, I might hunt that up from my records here and see what it would come to, but I don't think that it would be justified, if you were to eliminate the lumber traffic in western Oregon from the calculations. The perishables is something that I think would grow to a large extent, but it wouldn't be a very large factor, I believe, in the beginning.

Comr. MCMANAMY. What traffic are you taking into consideration in your answer? Traffic which was shown to be tributary to the line by Teutsch's exhibit?

A. Yes. All my information on the basis of perishable stuff is taken from Teutsch's exhibit.

Comr. MCMANAMY. You are not taking into consideration the possibility of through traffic to and from California points? In other words——

A. From Idaho, did you mean?

Comr. McMANAMY. Well, from Idaho southwest, and from San Francisco and other California points northeast, which has been developed in this record. Are you familiar with that?

A. Well, as far as the Idaho traffic is concerned, it is that which we have asked permission to put in later. I haven't given
1214 that consideration, because the figures didn't reach me in time to calculate the costs of movement. (2257.)

Comr. McMANAMY. You have not taken into consideration the possible traffic or the potential traffic which has been shown by the different witnesses that have appeared here?

A. I have as far as Oregon traffic only is concerned.

Exam. ROGERS. Well, I understood you, a little while ago, to say that you had taken into consideration the Idaho traffic, in one of my questions.

A. Well, I must have misunderstood you, because I haven't yet figured the Idaho traffic itself, in or out. The Idaho traffic is all tributary to the Oregon Short Line Railroad now.

Q. And if it moved over the cross-State line it would be traffic lost by the Oregon Short Line Railroad Company?

A. Well, if the Oregon Short Line were considered as owning the cross-State line, it, of course, would be only a diversion in another direction over its own lines. It is spreading out the operation over additional mileage.

Now, on page 128 I refer to some lumber shipments, and to the increase that I contemplate in the movement of lumber. I have made forecasts on the increase in this (2258) lumber production before, and numerous men, some of the most experienced and seemingly best informed and qualified manufacturers of lumber and experts in the lumber trade, have made prophecies and estimates on this lumber that was going to be manufactured, taken from this northwestern country and the increase that would result from the passing out of the lumber production by the southern pine mills. As to the estimates in that regard having fallen dismally short of the result that really obtains; I doubt whether that is strictly true. There have been a number of causes, as I understand the matter, intervening there. It is true that the southern cut hasn't decreased as rapidly as was expected.

1215 As to it being larger in 1926 than it was some previous years: I think not. My recollection is that there has been a slight decrease. I think there isn't a great reduction. The southern mills, while some of the larger ones went out of business, small mills went in and kept the cut up, producing in the aggregate substantially (2259) the same volume of southern pine that had been produced over a long period of years last past. As I read on the subject, it is stated that that is very largely inferior timber, consisting of second growth, small trees, and so on, and in so doing they are actually destroying their lumber industry.

On page 130, under 18, I estimate the annual imports of soft wood lumber by rail to the Pacific coast when the south ceases to export. I wouldn't venture any predictions myself as to when the Southern States will cease to be factors in the lumbering markets, the soft wood markets in the United States. I have presented here the estimates of Mr. Dunham, the engineer for the Southern Pine Association, who doubtless knows more about it than I do. He made that estimate in 1924, I believe. I had it from Mr. Charles S. Kieth, of Kansas City, and he states that Mr. Dunham's estimates were confirmed up to date, that the cut for 1924 to 1927 was substantially as Mr. Dunham had estimated it (2260) would be.

The condition of the lumber market should be given some consideration in determining whether there is a necessity for another railroad to serve the lumber producing areas of western Oregon, but the main factor is that which is already moving even under the present depressed market conditions, by reason of the economies that my study reflects.

On page 131 I have said: "The Southern Pacific statement already referred to as a part of Mr. Wiggins' exhibits shows that 18,586 cars of lumber went from Oregon points via Ogden into these States in 1926. The total lumber originated in the State by the 1216 O.-W. R. & N. in the same year was 19,426 cars. "I mean originating on the Oregon-Washington Railroad & Navigation system lines. The records show 19,500 cars originate in the State of Oregon alone. (2261.)

Q. According to those figures, you have the O.-W. R. & N. originating more lumber than the Southern Pacific in the State of Oregon; is that right?

A. Not at all. The figures 17,586 are on that going beyond Ogden; they do not include that which goes into California or goes east via the Southern line. The comparison is to all destinations on the O.-W. R. & N., and the 17,586 just went through Ogden east. In my table of traffic for the cross-State line, I used the traffic studies of Mr. Wiggins in compiling it, and the rates of charges given by Mr. Wiggins.

I determined how this traffic would be routed, so far as its haul over the cross-State line is concerned. I consulted both Mr. Wiggins and Mr. Teutsch in determining it. (2262.) I perhaps should explain that; it would be more nearly correct to say that I obtained from Mr. Teutsch his idea of the markets to which the stuff would go that he had to deal with, and I determined then what line, what part of the cross-State line it would have to move over.

Exam. ROGERS. Just a question there. Who was it determined that the Multnomah County traffic, or a part of it, would move via the cross-State line?

A. We took that as part of the traffic actually moving through Ogden, took it for granted that if it was reasonable to move it through Roseville to Ogden it was certainly more reasonable to

move it through Crane. We don't there go into the question of the possibility of diverting it via the Union Pacific. That, of course, might be done but it is not being done.

Exam. ROGERS. You didn't take into consideration the possibility of the O.-W handling it out of Portland direct?

A. Well, if the O.-W. originated it, of course they would; but this is Southern Pacific origination.

1217 Comr. MCMANAMY. And all of the traffic you have considered there moves via Roseville? (2263.)

A. All of the traffic we have considered in that light has in the past, and is to-day moving through Roseville.

Exam. ROGERS. I take it, then, you considered the Southern Pacific would handle it from Portland to Crescent?

A. Yes, sir.

Exam. ROGERS. And then it would go via the cross-State line?

A. Yes. That does not preclude, of course, the possibility of their making other arrangements at Portland whereby it might be mutually profitable to the two carriers to interchange, but they have not done that in the past. I know of no reason why I should assume they would do it in the future. It is very easily proved that it would be more economical and would cost a good deal less money to haul a carload of lumber from Portland to Granger, Wyoming, over the O.-W. R. & N. and the Oregon Short Line, than it would to haul it down through Roseville, thence to Ogden via the Southern Pacific, and then on to Granger via the Union Pacific. The difference there must be more than 532 or 533 miles; it is somewhere between five and six (2264) hundred miles; say 550 miles. The first part of the route, according to my statements, all the way through Oregon, is the most expensive operation per mile for direct cost, and from Oregon down through California, over the Siskiyous and Sierra Nevada Mountains and down to Ogden.

I haven't anticipated voluntarily that any part of that traffic would move down to Eugene and move over the cross-State line, merely from the fact that the Southern Pacific would get a part of the haul. We have asked that (2265) it be made compulsory as regards the interchange at Crescent Lake, in spite of the fact that it would actually be profitable to both carriers to do it. I have said the

1218 interchange would depend upon the interest that the carriers have in the matter if there were not interchanges established by the commission.

Exam. ROGERS. Mr. Newell, assuming that all you have said with respect to the saving and the possible divisions via Crescent Lake and the cross-State line is true, do you think it would also be possible, by the same methods, to show that an economical arrangement would also be possible via Portland? On certain of the traffic?

A. For a part of it with a less advantage, obvious advantage, to both carriers than would be via Crescent Lake.

Exam. ROGERS. What was that?

A. I say, with a less obvious advantage to both carriers; I mean, the net advantage of the compulsory division would be less than it would be at Crescent Lake on the traffic at Eugene and central western Oregon. As regards Multnomah County traffic, or Washington County traffic, what you say is true.

Exam. ROGERS. How far south of Portland do you suppose (2266) you could go with that arrangement?

A. I have not considered that specially. I don't know just how far that would work.

Exam. ROGERS. Would it go down to an equidistant point between Portland and——

A. No, no; it would be less than half way from Portland down. I mean half way between Eugene and Portland, somewhere around, possibly Salem; not out or at Albany; Albany is more than half way to Eugene. It would be a good deal more economical to haul it from Albany via Portland than it would be to haul it from Albany via Roseville and Ogden, but not more economical than to haul to Eugene and across the State line. The Tillamook branch is a large traffic producer of lumber. That would be Portland traffic, because it would come through Portland in any event, or nearly to Port-
1219 land. From Portland it comes through the (2267) Willsburg gateway; that is practically Portland. The yards of the Southern Pacific where it is hauled in and put into the main line trains are in the city limits, across on the east side of the river, at a location called Brooklyn; known for years as the Brooklyn yards.

Exam. ROGERS. The thought just struck me, Mr. Newell—I don't know whether there is anything to it or not—if compulsory, or even voluntary arrangements are going to be made, considering only the western Oregon eastbound traffic, would the logical thing be to put in two arrangements, one via Crescent Lake and the proposed line covering traffic originating in a cerain territory, and another one via Portland on traffic originating in other territory?

A. That might be true. I would think that if a compulsory arrangement were made at Crescent Lake, that the interests of the carriers probably would permit them to make a voluntary (2268) agreement at Portland, if there were any advantage jointly to them in it. The joint arrangement now in existence as regards interchange of lumber traffic at Portland is such that it is more profitable to the Union Pacific to accept the same car at Ogden than at Portland.

Exam. ROGERS. You mean the way the divisions are set up?

A. Yes; sir.

Mr. SPENCER. How is that?

A. I say, it is more profitable to the Union Pacific to accept a car of lumber now, under the present division of rates, at Ogden than at Portland, if it originates at Portland. Twenty-five per cent of that is because of the large divisions that the O.-W. R. & N. has against the Southern Pacific for the traffic on its rails in western Oregon. That is for Missouri River and east. I under-

stand it to be 25 per cent, no matter what the destination is, if it goes as far as the Missouri River. As to the small traffic that may not go that far; I am not clear about that. I have made
1220 calculations to determine that it is more profitable to receive it at Ogden than it is at Portland. (2269.) In fact it would be very much more profitable for the Southern Pacific to deliver it to the Union Pacific lines in Portland.

Exam. ROGERS. Profitable for whom, Mr. Newell?

A. To the Southern Pacific.

In my estimated earnings table, the western, southwestern Idaho traffic was not considered. On page 133 westbound, I start with Crane because the cross-State line proposed is to start at Crane.

Q. And you have 385 carloads of corn from Crane to Crescent Lake. Now that corn—you don't anticipate the growing of corn at Crane, or around Crane, or in the Harney Valley, do you?

A. I will have to look up the source of that. That was given me by Mr. Teutsch.

Exam. ROGERS. You mean whether you took the Idaho traffic into consideration depends on whether Mr. Teutsch took it into consideration or not?

A. Yes. (2270.)

Q. (By Mr. SPENCER.) And whether Mr. Wiggins took it into consideration? You used Mr. Wiggins' exhibit——

A. Well, Mr. Teutsch furnished Mr. Wiggins with all the figures relating to this kind of traffic. Mr. Wiggins applied the rates to the traffic. Then I took the traffic and the rates and made the distribution to the cross-State line. I calculated the cost appertaining to the cross-State line. Mr. Wiggins had made already the distribution of earnings to the cross-State line.

Q. I recognize, or the reference is here that the traffic in this Table 13 was prepared by Mr. Wiggins. For instance, he is shipping potatoes and apples, hay from Crane, 702 cars of hay to Crescent Lake. Now that originates over there, doesn't it—it does not originate at Crane. The hay is the hay they have been talking about from irrigation projects of Malheur County?

1221 A. Why, the tables show how that was obtained. Mr. Teutsch had estimates, not only of production of the western Oregon counties, but of their use of certain commodities, of which hay was one. Now the hay shown as moving is that going into the western Oregon counties. (2271.) And without regard to where it might originate. Where hay was shown also as a product originating in Malheur County, we left it out of consideration, because that would cause a duplication of it. Now it is true that of the hay shown in these counties some may come from Idaho. If it is shown when the Idaho figures are presented to me that there is going to be that duplication, I expect to eliminate from the Idaho production the amount of hay that has already been taken into account in the hay going into western Oregon. And the same thing would be true of corn and of wheat.

In the items, 988 carloads of cattle for the cross-State line. We don't anticipate any such number of cars as that originating at Crane itself. I take no responsibility for those figures, Mr. Teutsch has presented them. They reflect in that table a consolidated summary amounting to 3,777 cars. Of agricultural products and livestock, horses and mules, the bulk of them originating from Crane; some little miscellaneous from Fort Rock. (2272.) A greater part of that is supposed to come onto the cross-State line at Crane. That means, of course, origination in Harney County, or any point east. The originating points or producing points are Malheur and southern Idaho. But southern Idaho is not included here, except in the manner in which I state, that if some of the hay and corn going into western Oregon, and therefore included here, may be found when we get the Idaho statement to be put in as originating in Idaho. If that is the case we shall eliminate it from the Idaho traffic, because otherwise it would be a duplication. There is a possibility of that southwestern Idaho traffic being included in these tables in that manner.

1222 You will have to ask Mr. Teutsch about there being any such traffic over there in Harney County as 4,000 cars. I have taken his figures.

Q. Now on top of that, take the traffic—well the third year is doubling up of the proposition there. You get up to 4,628 cars from the same origin? (2273.)

A. Yes.

Exam ROGERS. Mr. Newell, did you take into consideration all the traffic that Mr. Wiggins took into consideration in the preparation of these exhibits 26, 27, and 28?

A. Well, I have not even seen his exhibits, but I suppose that they contain just the same traffic that I have used. That is, I saw the figures from which he made it up into exhibit form; and I relied on those figures in making my tables and computations.

Exam. ROGERS. What I have in mind is, I have here Mr. Wiggins' explanation, and he said, "By separate exhibit of three pages, tonnage and revenue calculations are shown for the movement of the ten southwestern Idaho counties via the cross-State line, on the same basis that we used in the Oregon traffic." I am just wondering whether you took those into consideration or not?

A. I had an exhibit prepared in which to take into account the figures which he there names, refers to; then it appeared, from what I was told here of what other witnesses had said, that there was some confusion as to this Idaho traffic, and we wanted to straighten that out before my figures were finally put in, and that is the reason my figures were not presented, in order to determine if there has been a duplication there. (2274.)

Exam. ROGERS. This morning when you answered Mr. Spencer and the commissioner about the justification of this line, did you have in mind that southwestern Idaho traffic?

A. Yes; knowing approximately what it will be but not
1223 having the figures prepared so that they could be properly presented as an exhibit.

Exam. ROGERS. Well, I took it from your answer to the commissioner that when you talked about the line being justified without the western Oregon traffic, that that totally ignored the southwestern Idaho traffic?

A. I did not intend to be so understood.

Q. (By Mr. DEY.) Mr. Newell, in your report prepared in 1925 and introduced in the so-called Klamath Basin cases as Exhibit 56, at page 13 you state, under the title "Proposed transcontinental routes to serve central Oregon," Item I, the following: Westward from the end of the Crane branch of the Union Pacific the proposed road would pass for about 50 miles through a lake country, with large marshes and irrigated hay ranches, and bordered by extensive stock ranges. This country is capable of producing a great many cattle, but production is now restricted on account of the lack of transportation." Is it in that 50 miles that Mr. William Hanley's land (2275) is located?

A. Part of it is, at least. I don't know where his holdings all are, but part of it would come in that. That is the district I have in mind, the Harney County stock raising district. I did not hear Mr. Hanley's testimony.

Q. And then you continue as follows: "Eastward from the proposed connection with the Southern Pacific"; that is at Crescent Lake, I assume?

A. Yes.

Q. "The line would traverse about forty miles of pine forests, and would then pass for twenty-five miles through the Fort Rock Valley, a large part of which has been shown to be capable of irrigation. "That pine forest that you speak of forty miles east of the Southern Pacific Company's Cascade line is fairly well served by that line, is it not?

1224 A. Yes, but more particularly by the new Great Northern line. That is, since this report was prepared we have also the Great Northern extension from Bend, in Deschutes County, to Chemult, in Klamath County, which lies some (2276) twenty miles east of the Southern Pacific Cascade line right through this forty miles of forest. The distance of forty miles does not quite describe it as it now is. The junction point is now expected to be further west than I thought at the time. Probably it would have been nearer correct to have said fifty miles from the junction, because now with the Southern Pacific location, after further study in the matter I concluded that the junction would have to be further west—should be—than I had thought proper in 1925.

But what you say is substantially true, that the Great Northern line coming down through there enables the greater part of that timber to be reached. It would be a question of its shorter route to its market after it was cut. There is no special need of any of these

railroads through there merely for the purpose of logging roads, as far as that is concerned. Their utility is for outlet of the finished product. The loggers themselves can attend to the logging roads that will reach the trees and get them down.

Q. But it is a fact, or do you know whether or not it is a fact, that timber is now being logged out of this very forty mile belt, and being transported by the Great Northern in logging trains to Klamath Falls for milling? (2277.)

A. Well, I have not been up in there.

Q. Or to the mills in the Klamath Basin?

A. I have not been in there since the Great Northern line was finished, so I don't know what they are doing.

Yes, I made a timber study of practically the entire State, which I introduced in considerable detail in the hearing of the Klam-
1225 ath Basin cases. It is quite possible the main portion of this timber belt, extending fifty miles east of the Cascade line, will be milled either by the Bend mills or at the Klamath Basin mills. I think likely that some other mills might be established in some other sections. I would not say that there would not be. (2278.)

I would think that high territory along the Cascade line north of the junction between the Great Northern and the Cascade line would be a natural place there for milling, where the Williamson River comes into Klamath Marsh. I think they might get that far north. I don't remember now; I think that is a little farther north than Kirk. I don't look for the establishment of any large mills on the proposed cross-State line where it passes through this timber belt. I think there would naturally be mills in at Silver Lake to reach that territory, and a short spur from the cross-State line. Only a few miles would bring that in and make that the natural outlet, I think, for that much of the territory.

As to including in this timber belt forty or fifty miles east of the Cascade line of the Southern Pacific, the Silver Lake timber, I merely said that the timber belt extends out through there. It extends both north and south from the cross-State line. The Silver Lake timber would be more easily reached by the cross-State line than by any other.

The Silver Lake timber is included in this belt (2279) that I mention here. It extends all the way along there, as the map here shows, and as that photographic copy shows, all the way both north and south along there, and in a fairly uniform line, extending out as far as Silver Lake, and as it goes further south extending still further east.

In proceeding as follows: "The remaining 65 miles is barren and has no present prospect of producing traffic, except that about twenty miles south of the line there are large mineral
1226 beds, which were shown in the Central Oregon Railroad case to contain very valuable deposits." By mineral beds, I mean the soda deposits of Alkali Lake. But I certainly would not make

the other statement about the barrenness of that country, after having seen it. I had taken the testimony of the railroad witnesses as regards the character of that country in the Central Oregon Railroad case, and I don't consider it correct now. My judgment of that country is quite different, after having been through it and having seen it. In other words, I want to change this statement that I made in 1925 as to the barrenness of that remaining 65 miles. After having been over the country and seen the character of the soil and the prospects of water for domestic uses, I certainly would not make that statement now. (2280.)

This is the so-called High Desert country that the witnesses have spoken of. Some of the best range country I saw anywhere out in central Oregon in an extended trip. I was there last October. We started out from Crane westward, along the south side of the lake and out to Mr. Hanley's ranch, and then from there out following as closely as the road would permit the location of the cross-State line, out to Wagontire, south to Alkali Lake, back up along the Wagontire Mountain through the valley there, near the eastern end of the Christmas Lake Valley, and back to the Bend road. I had previously been out through the Fort Rock country and Christmas Lake Valley, out beyond the Ernst ranch a little ways.

Including this 65 mile stretch and including Fort Rock Valley of 25 miles, that would make 80 miles of territory in which there is now substantially or practically no production. (2281.)

1226½ Q. I take it from your testimony in the present case that your statement shown on page 21 of your study prepared in 1925 still holds true, which is as follows:

"No scheme for the development of central Oregon can be considered complete or satisfactory without the direct route east, but the cross-State line cannot be built if it is to stop at Odell Junction without any further provision for reaching the traffic of central or western Oregon. It must have joint use of all the lines now proposed in Klamath and Lake Counties."

By that you mean it should have joint use of the Great Northern proposed line from Bend down to Klamath Falls?

A. Well, I would say now that it ought to have joint use of those. I do not believe now that it is a necessity.

1227 I made a suggestion at that time that "The Willamette Valley has already more than sufficient railroad mileage for the territory served, and it is important that there be no further duplication. I suggest that the Union Pacific should be given joint use of the Natron cut-off from Odell to Eugene, and of the Southern Pacific lines between Eugene and Portland, excepting the main line." I don't know that I would follow that up now. I merely made it as a suggestion. I am not sufficiently versed in these matters, I think, to urge that kind of an arrangement (2282), though I believe it would be a wise one.

At that time, I represented myself as correctly as I could, in transportation affairs, laying out a scheme of railroads for central and

south central Oregon. I didn't take upon myself any qualifications that I thought were not justified.

Exam. ROGERS. Have you changed your opinion, Mr. Newell, as to the rail facilities in the Willamette Valley as expressed there?

A. As regards the country served having more than sufficient mileage I have not changed my opinion.

Comr. MCMANAMY. How far south do you consider the Willamette Valley extends?

A. Practically to Eugene.

Comr. MCMANAMY. And did you express any opinion at that time, or do you care to express one now, as to what should be done with the territory south of the Willamette Valley?

A. I did not express any opinion then, and I would only express the opinion now that there is much territory in there which
1228 can be developed. I do not recommend any compulsory action on the part of the commission toward any carrier, but only that there are great possibilities in there for the extension of roads to reach territory not yet served. (2283.)

Again referring to my study of 1925, Exhibit 56 in the Klamath Basin cases, to which were attached several maps or drawings labeled "Plates," and referring to Plate No. 4, "Map of Oregon showing standing timber, railroads and proposed extensions," the compilation made at that time as shown upon this exhibit was made from the best sources available to me, and my judgment then was fairly accurate. My judgment as to the accuracy of that exhibit still obtains.

In the Silver Lake district of Lake County, or some few miles below it, is a block labeled 1,600,000,000 feet; that is supposed to show all of the timber in that locality; that is the timber lying in there practically within the drainage area of Silver Lake. That about marked its limitations. All of that timber would best be milled around Silver Lake, if there were an outlet east by a short route from Silver Lake; not under the present conditions. Under present conditions (2284) I think it would eventually be hauled probably into Klamath Falls, or, more likely, down the Sprague River to be milled. It is practical to handle it that way. It means an uphill haul for a considerable part of it, where the other would mean a downhill haul. With equally good facilities for milling, and outlet, it certainly would go to Silver Lake. But it is not anything impractical to take it to Sprague River or Klamath Falls.

I have no doubt that the control by ownership of the timber would have a good deal to do with where it was milled, on the milling conditions and of course the rail conditions also. If it were controlled by mill operators in the Klamath Basin, that is most likely where it would go; not necessarily. Of course they
1229 might find it advantageous even to set up new mills and mill it elsewhere, if the advantages were sufficient. It would not be possible now to answer that question with any certainty. I say it would be certain that would happen if there were no outlet to

the east, but I am inclined to think even those owners might find it to their advantage, even, with mills at Klamath Lake, to mill at Silver Lake, if there were this short outlet east. But I could not say that with certainty, of (2285) course. All kinds of conditions would enter into that. I may say that no claim of traffic from this territory has been set up in my figures.

A certain portion of that 1,600,000,000 feet of timber in the Silver Lake district is Government timber. I think it is only as it is Indian reservation timber. I am not certain whether there is national—oh, yes, there is some national forest timber also. That includes all the timber in Federal ownership as well as the privately owned.

I could not answer as to whether that 1,600,000,000 feet of timber which includes everything in Federal ownership and in private ownership in that district would justify the investment in any extensive milling operations around Silver Lake, taking into consideration the definitely established policy of the Forest Service with respect to selective cutting and sustained yield, but of course I would point out there that any mill at Silver Lake would also have access to these other blocks of timber, although not on the same advantageous situation. They could reach over those same ridges there and reach that block of 7,800,000,000 shown to the westward, and some of that 4,300,000,000 to the southward. In this (2286) map here I merely attempted to show each main district in one solid block, timber which is scattered all over it. It is not like this map here before us, where that is shown by the township.

1230 They would have to reach over the ridges and pull it over into the Silver Lake drainage; just as the other mills would have to take that 1,600,000,000 and pull it in the opposite direction. The ridges are high but they are not particularly step right at the top. It is high country. It can be reached, most of it, on two or three per cent grades, which are not considered anything for logging roads.

I recall in the Klamath Basin cases it was agreed that the timber in the extreme northwest part of Lake County would probably be milled over at Bend. In giving direct testimony as to the stand of timber in western Oregon (2287) I certainly didn't say that the timber of western Oregon is practically under the exclusive service of Southern Pacific lines and is only skirted by other lines. It is not exclusive. I said it was tributary to the Southern Pacific. The Southern Pacific is at least on equal terms with practically all of that timber. Some of it is on much more advantageous terms than any other carrier to carry it; other parts of it, other carriers are in equally advantageous position. That is not all the timber along the west coast of Oregon; it did not include Clatsop and Columbia Counties. Referring again to Plate 4 of my study prepared in 1925, it shows in Clatsop County 5,500,000,000 feet of timber, none of which is within striking distance of Southern Pacific lines; and none of which did I include in my statement in this case.

That will clear up any question about my statement including the entire west coast of Oregon and that timber belt lying therein. In other words there is 5,500,000,000 in Clatsop County that is reached only by the Spokane, Portland & Seattle Railway, which is owned by the Great Northern and Northern Pacific (2288) fifty per cent each. In Columbia County the same statement is true with respect to 8,250,000,000 feet of timber; in western Oregon, that is correct, and in Washington County we have 5,100,000,000 feet
1231 of timber, Washington County adjoining Multnomah County here, which is served by the Northern lines' subsidiary companies as well as by the Southern Pacific and is included in my statement of the timber tributary to the Southern Pacific. (2289.)

In Linn County I showed 24,900,000,000 feet of timber in my 1925 study and that figure is included in the figures I gave here the other day. The Oregon Electric, which is owned jointly by these two Northern lines, has a line through that county, and it is reported in the papers that it is that company which is extending a line out into the timber which is included in the 29 billion feet. It is so reported in the papers that it has purchased rights of way and has applied to the Interstate Commerce Commission for a certificate.

In Lane County, forty odd billion feet shown in my 1925 study is also included in the figures I gave here of western Oregon timber. The Oregon Electric runs through that county as far as Eugene. I know of no logging roads, however, that it has by which to reach the timber. But there isn't any serious difficulty (2290), that I know of, there, when the occasion demands, for the Oregon Electric in Lane County doing exactly what it is now doing in the adjoining county of Linn.

I would naturally expect that this timber that is tapped by the subsidiary line of the Northern lines in the Willamette Valley will move east over the Great Northern and Northern Pacific. I haven't compared their lines. I wouldn't say very much more circuitous. I think somewhat longer than the cross-State line. I haven't the mileage figures before me to make an accurate answer to that. As to it being longer than the Columbia River route of the Oregon-Washington Railroad & Navigation Company, Oregon Short Line, and Union Pacific, or as long, my recollection of comparative figures that I have made is that the Northern lines from Portland to Chicago are practically the same length, very nearly the same length, as the Union Pacific line and connections.

1232 Q. Now, why haven't you included in your study and plan (2291) for the present case that traffic to support the cross-State line? Because Mr. Wiggins didn't do it, is that right?

A. No; not Mr. Wiggins' responsibility. In the first place, that traffic has not yet begun to move, if you are talking now of the Oregon Electric and its collections of business, and I know of no means by which that could be compelled to be diverted to the cross-State line nor any showing of economies to result from it which

would justify an attempt to get it ordered that way. The Oregon Electric has been built into the Willamette Valley for a great many years. I don't understand that it handles a very substantial traffic to be the fact. They complain bitterly that they can't make enough to live.

On the principle that I contend for, that the shorter route should be used for handling the traffic in order to accomplish savings, there is very marked distinctions between the northern lines going into the Willamette Valley and hauling traffic out of there across the continent, on longer routes than the cross-State line, on the one hand, and the Southern Pacific Company doing the same thing out of the same traffic area. (2292.) One is the question of degree. The Southern Pacific hauls that out of there on very much more circuitous routes. Further, the northern lines would take it into territory not reached by other lines at all. Now, I don't know that they would haul that timber out of that territory into Chicago and east. Doubtless they would send much of it into the markets in the Northern States for which their routes would be the shortest rather than the longest.

Doubtless that line will compete in western Oregon for business to Chicago and these other points that are reached by the other routes, when it is completed, compete in some degree for that traffic, but as I recall the figures it is a much shorter line than the Southern Pacific's route to that territory, much shorter than
1233 the Alturas route; that is my recollection only. I haven't looked it up recently. Then, I think there is this difference that ought to be pointed out, that in this case what we are asking to be dealt with is traffic originated by one carrier and handed to another, and we are merely proposing a different point for that exchange whereby the (2293) haul will be very distinctly shortened.

The principle I am trying to establish and the end I am trying to reach is economy of operation, for one thing, and service to territory not yet served made possible by the observance of that economy in the long-distance haul. Now, that is made less difficult, has less disturbance of relations one carrier to another, when it involves only a change in the point of transfer between the carriers, than it would if it were a matter of compelling one carrier to give up a haul half way across the continent to another. Now, that would involve more difficulties of adjustment. The desirable principle to observe is the same, that is, that the traffic moves by the most economical route.

Q. Well, then, because the Southern Pacific happens to connect with the Union Pacific at Ogden, and the northern lines don't, you think it is more justifiable that its long haul be taken away from it and the other people be left with theirs?

A. It is more difficult to make adjustments which would be required to take it away from the other lines, more distrubing conditions and possibilities of injustice. (2294.)

On my Exhibit 17, which is a map showing the timber quantities designated by stars, it is the intention that those areas where I have put stars I have represented all the standing timber, and it is the timber as estimated or determined by various means by the assessors. It doesn't purport to cover all the timber in the State, but in the areas where stars are shown at all it purports to cover all of the timber as the assessors find it.

Exam. ROGERS. You are referring now to Exhibit 17?

1234 Mr. DEY. Yes.

A. The estimates are sometimes quite different from those of the State forester which were used in the other exhibit to which you referred.

When a new line is turned over by the construction department to the operating department the maintenance is frequently considerably heavier the first two or three years than afterwards. It is likely in all cases to be somewhat heavier.

Q. On page 62 of your Exhibit 16 in this case you say, "The country to be traversed by the cross-State line is (2295) similar to that occupied by the Oregon Short Line, except that it is somewhat less mountainous. Maintenance, therefore, should not cost more than an the Oregon Short Line, and I put it at the same amount, and use the same figure of 16.5 cents for the gross ton-mile." Shouldn't that be modified, then, by the—qualified by the suggestions that I have just made, that the maintenance on any new line, so many things that have to be attended to and taken care of, that for the first——

A. For the first year or two that might be the case, but I think it is sufficiently balanced by the statement that it is somewhat less mountainous country, and that, therefore, normally it wouldn't be quite so much, but that for the period covered it shouldn't cost any more.

Q. On the same page you say, "Operating conditions on the Southern Pacific and the O.-W. R. & N. lines in Oregon are so nearly alike that I attribute the marked excess of the former in fuel and trainmen to the much greater amount of branch line mileage on the Southern Pacific. These differences will not exist in a comparison of operation over the Southern Pacific from Eugene to Klamath Falls with that over the proposed cross-State line." Now, you are talking of the items of fuel and trainmen, and you are dealing with the line from Eugene, where they make a climb of over four thousand feet up the Cascade Mountains on a 1.8 grade for

1235 a (2296) large part of the way, and do you think it is quite fair to say that the amount of fuel used over that piece of track will not average up a whole lot greater than the average of the Oregon-Washington Railroad & Navigation Company lines in Oregon?

A. I don't say that. What I am referring to here is my unit cost. My contention is that it won't cost any more to produce the energy required to lift one ton one foot on the Southern Pacific than the

average of the similar cost on the Oregon-Washington Railroad & Navigation Company lines, but in that operation you speak of there are a great many more foot-tons required, and that is taken into account in my detailed compilation by applying that unit cost to a much greater number of foot-tons.

In the table that I have prepared showing costs and savings, and particularly savings based on traffic, page 105 of my Exhibit 16, has no reference to these tables being based upon the assumption on my part that the Alturas line will be completed three years after the cross-State line is in operation. I think you must have given me the wrong page. (2297.) I have some tables there showing eastbound business from Klamath County. I have shown what would be the result, possible earnings, in the comparison between the cross-State line were to be made only with the Roseville line for three years. After that time, in my first presentation, I assume that the Alturas line is then built and in operation and show what the earnings would drop to.

And I present another statement in which I have shown that the Auturas line is in operation to begin with, and make the comparison with that solely. In view of the present situation, as I understand it, that depends, of course, on whether the road is now going to be built,

if the set of figures which I have prepared should be taken into
1236 consideration now. I don't know whether it is or not. Assuming that it is completed and ready for operation May, 1929, then your statement holds good. (2298.)

Q. (By Mr. Dey.) On page 138, on the item of taxes, would you think, Mr. Newell, that the taxes on this proposed cross-State line would be higher or lower than the average taxes per mile of the 1,400 miles of the Southern Pacific lines in Oregon, including the cheap branch lines with the main line?

A. I don't know what those taxes are, and I hadn't thought of it in that light at all.

Q. Well, they are about a thousand dollars a mile, and don't you think that your cross-State line will be taxed per mile at least an average of the taxes now collected from Southern Pacific lines in Oregon, including all branch lines, as well as main lines?

A. I haven't made any particular study of that. I believe that there is a tendency to hold the assessments down somewhat on new lines. I don't know whether that is law or human nature, but I think, as a matter of fact, that they are generally or lightly taxed as new lines. I can't say, I have given the source of my estimate here, that that is about what the Oregon-Washington Railroad & Navigation Company pays, and I have applied that figure here. It may be that you are right. I couldn't determine that. (2299.)

If you are right, and if that average that the Southern Pacific pays now, eight million five hundred thousand dollars a year on fourteen hundred miles in this State, that would be a little over a thousand dollars a mile, and would run the taxes up to at least $189,000.00 on my 189 miles, but I could hardly think that would be

an applicable figure, because surely a very large portion of that tax would be applied to terminals and main line, which is a line of higher class, higher-class construction, certainly, than would be required on the cross-State line. I would certainly think it wouldn't come up to that average under any circumstances.

1237 I wouldn't expect the cross-State line to be a better line than a lot of these Southern Pacific branch lines in Oregon, of which there is a great mileage, but I think that probably no better than some of them.

Q. Well, what, for instance, what Southern Pacific branch line would you figure on duplicating across the central Oregon territory, so we can get an idea of about what kind of railroad you have in mind?

A. Well, I hadn't even considered it in that light. I think the Coos Bay line (2300) or the Tillamook line would be a fair sample. I believe that either one of those would be a good average, between our branch lines and main lines.

I have never had any experience with the State Tax Commission, as to their attitude on new lines, such as the new Natron-Cascade line, in the matter of taxes.

Q. Now, you were speaking this morning of that part of Oregon which could find a shorter route through the Portland gateway than by way of Crescent Lake, and would you say that it was fair to take that part of Oregon which is served by the Southern Pacific, fair to take Tillamook County, Washington, Multnomah, Clackamas, Yamhill, Marion, and Polk Counties as being nearer to the East, nearer to Ontario by way of the Oregon-Washington Railroad & Navigation Company Columbia River route, than by way of the Cascade line, in actual mileage? (2301.)

A. Well, certainly the first named counties that would be true, but it is a matter simply of fact to be determined by cancellations of mileage. I don't like to express an opinion on it off hand. As regards those other counties, I would have to figure it up and see. It would be doubtful about Marion and Polk. I think it would be a slight difference in favor of the Portland route from Yamhill. As to whether there would be very much doubt about Marion County if Salem were the equidistant point; I didn't say that Salem was the equidistant point. It is about there, but I hadn't figured it up. I don't like to say.

1238 Until the Alturas line is put in operation, I expect a portion of the Rogue River Valley pear crop, and perhaps some other commodities from down there to move over this cross-State line, and after that (2302) I haven't counted on any of them moving over the cross-State line, although I think, as a matter of fact, it would prove to be a cooler route and there probably would be some move that way, but I have made no claim that any would in the figures I have presented.

Exam. ROGERS. Do you think the ore or lumber or timber, or commodities not affected by temperature, would move over the cross-

State line after the Alturas route is completed, from that Rogue River territory?

A. I think that undoubtedly some of it would, because in general these things are governed by temporary conditions, so some of it would that go, but I wouldn't present it as having any advantage for that route for the through traffic. When I say "that route," I mean (2303) the cross-State line over the Alturas line, from Jackson and Josephine and Klamath Counties. I think there would be, as a matter of fact, a slight difference, but not enough to insist upon it as the probable route of movement—a difference of 40 miles or such a matter.

As to how this fruit is handled now, with respect to what service is given to it to the East via the Southern Pacific lines, I do not know in detail. It so happens that I have heard very little testimony in any of these hearings, and none whatever in this case. I know that this fruit is seasonal, these pears are all shipped out over a period of a couple of months.

Q. And they move in train loads down to Roseville, or certainly in large blocks to Roseville, and there it is coordinated into similar blocks of California fruit moving east, and it is given very expedited service?

A. Well, I know that is the general way it moves. As to
1239 the quality of service, I know nothing about it. (2304.)
That service undoubtedly costs money. I think it would unquestionably follow that the pear crop would be divided up and have the carriers maintain a duplication of such expeditious service through this other route across the desert, because all of western Oregon needs that kind of service, and with it provided by that shorter route I think there is no question but that it would grow.

Comr. McMANAMY. Before we get too far away, how did you have in mind the traffic from Jackson and Josephine County reaching the Alturas route?

A. By way of Black Butte, then northward to Klamath Falls. Down into California, to Black Butte. Up to Klamath Falls, then over the Alturas route. There is an expectation there in that territory that that Butte Falls line will be completed, and that, of course, would then furnish a still shorter route.

As far as quality of track is concerned, I think you could make the time that is necessary for the handling of this over a branch line such as the (2305) Tillamook line that I have described.

Exam. ROGERS. Mr. Newell, while we are at this point, maybe it would be a good place for you to tell us what sort of service you contemplate across this line. There has been considerable mention of your position here, that it would be branch line, and the assumption was indulged in that you would therefore have branch line service, that that is what you have in mind.

A. The question of economy service on a branch line isn't altogether due to the fact that it is a branch line. It is a question of

volume of traffic. This would be, as far as the volume of traffic for which I have figured, there is no reason why the service there shouldn't be practically equivalent to main line. It would be connected at both ends. There wouldn't be this matter of hauling empties in the entire length of line in order to get the loads in every case.

1240 Exam. ROGERS. There has been an assumption that put to several witnesses here that if they had train service three times a week across this branch, as they do have on some other branches, what the value of it would be. What is your thought on that.

A. No such traffic as I have figured here could be taken care of on that basis, the main point is that it (2306) would move in large trains; it wouldn't be confined through the necessities of giving local freight service to trains to hauling much less than they could haul. From that standpoint, the fact that the country is uninhabited is really an advantage, because there is no service required in there for the purpose of taking care of the inhabitants who might be just passenger service or frequent freight service; it would simply be a question of loading up trains and sending them through. Of course, when it came into the handling of the refrigerated stuff, that would have to have volume sufficient to justify the facilities necessary for taking care of it, and I think Mr. Teutsch has shown the possibility of that kind of traffic sufficient to justify the assumption that it would be provided.

Q. (By Mr. DEY.) You think, then, a branch line such as the Tillamook line, so far as track is concerned, the standard of track, character of track, would be sufficient to enable any such carrier as may build it to give the service in the Rogue River Valley by that route that is afforded by the Southern Pacific route through Roseville to the east?

A. You say the Tillamook line—I haven't been on that for some years, and I don't recall very well what its track standard is. I would say that such a line, such a track, as that of the Coos Bay line, over that smooth, dry country of central (2307) Oregon, with moderate curves and grades, would be sufficient to take care of that traffic. Considering the shortening of route that would occur as between here and the line through Roseville, I would say that this can be moved from the Rogue River Valley down to Black

1241 Butte, then back into Oregon, up to Crescent Lake, then across the high desert, through the curves and windings of the Malheur Canyon, over such a line as our Coos Bay branch, and the shipper can be given a service that we give him over the existing main line divisions between here and California. Undoubtedly on that hundred miles there between Crane andn Vale, some such a distance through that Canyon, there would be some slow-speed line, but I don't think that is perhaps over 50 or 60 miles to which that would apply.

Q. That would involve a transfer from a main line to a branch line of different ownership and operation at Crescent Lake, to the main line of the Union Pacific——

A. Well, I wouldn't consider that a branch line across there. Its operations would be practically those of main line, with that volume of traffic, and connections through at both ends.

Icing facilities, and that sort of thing, would have to be established where necessary, of course. (2308.)

Of course, those questions are on the assumption that the Alturas line is not yet finished when the cross-State line is finished.

Q. It is conceded, I understand, that all this Rogue River traffic should move over the Alturas line when completed?

A. No; not conceded that that is the best way for it to go, but that there isn't sufficient difference to justify any attempt to compel it to go otherwise.

Redirect examination:

Q. (By Mr. McCULLOCH.) Mr. Newell, in mentioning the pear traffic from Jackson County, Mr. Dey asked you a question based on the assumption that that traffic would move south to Black Butte, then north via the Cascade line to Crescent Lake, and then east via the cross-State line. Do you know how the distance of getting—

1242 distance would compare of getting to the cross-State line from Jackson County by going down to Black Butte and then north to Crescent Lake, or, on the other hand, of going north from Jackson County to Eugene and then to Crescent Lake? (2309.)

A. As I recollect, it is almost an even break. The distances are almost exactly the same, I think. To get to the cross-State line, pears might move south to Black Butte and then north to Crescent Lake, or north from Jackson County to Eugene and then over to Crescent Lake. The probabilities are that the facilities will be more easily furnished on the latter route.

As to the character of service I would expect over the cross-State line, when built, I would expect that on such grades and in such a country as that it would be no trouble to maintain tracks capable of carrying heavy trains, that the service would be mostly of such a character that the freight could accumulate to the point of sending trains out fully loaded. There would be no occasion arising through the necessities of serving anybody along the line that would call for any particular frequency of service. It would be practically a full-train movement across there. The track, of course, ought to be built of such a character as the circumstances would apparently justify, and that, I think, as a matter of economy, would call (2310) for a fairly good track to start with.

As to the standpoint of total cars in a train, the situation on the Oregon-Washington Railroad & Navigation Company main lines in Oregon, I have found an average of about 56 cars to the train, as

full-train movement. I contemplate that such trains could and would be moved over the cross-State line.

With respect to the continuity of the service, an intermittent service such as has been testified is given on the Rogerson-Wells line of the Oregon Short Line, where it has been testified here that the service is two or three times a week, no such service as that is expected on the cross-State line. My figures of eastbound traf-
1243 fic for the first year amount to about 33,000 cars, that would be a matter of a hundred cars a day, or something like that, to send out, nearly two full trains every day, eastbound. (2311.)

I would expect the service on the cross-State line to differ from the service on the Oregon-Washington Railroad and Navigation Company main line between Ontario and Portland in that I wouldn't expect any passenger facilities of importance to be necessary, but as far as the shipper is concerned, I would figure that the freight service would be practically the same, that is, that trains would go through at reasonable speed, and, of necessity, with such frequency that the shipper would be fully served.

Q. Mr. Newell, have you made any calculations, or could you give any estimates, of whether the northern Oregon counties in the western part of the State, like Multnomah, Clackamas, and Yamhill, would be nearer to Missouri River points like Omaha, from the standpoint of cost of service, direct cost of service, via Portland than they would be via Crescent Lake?

A. Very nearly the same. Out of Portland itself, and what must pass through Portland, my recollection of my figures is that the cost would be a little less via Portland, and Portland would be the most northerly point I could take to compute the respective costs. As you go south from Portland (2312) the difference would become more and more in favor of the Crescent Lake route.

Exam. ROGERS. You don't know what the situation is as to congestion in the Portland terminals now and the last—oh, three or four years?

A. As effects the eastbound traffic?

Exam. ROGERS. Yes.

A. I don't know of any that makes any trouble. (2313.) I haven't studied the terminal situation in that respect. All these years I have been working for the county commissioners, none of those questions have taken up the question of congestion. I don't know of any congestion as regards eastbound operations. I
1244 have said, and I think it is true of any large terminal, that the tendency is that it costs more to put through that terminal than it does smaller terminals, if for nothing else, longer distances to move the cars. If that be the fact, whatever effect there might be on the comparative advantage or disadvantage of routing traffic originated by the Southern Pacific in the northwestern counties of Oregon, like Multnomah, Tillamook, Clackamas, and Yamhill, via the Portland gateway on the one hand, and via the Crescent Lake gate-

way and the cross-State line on the other to eastern point, would I imagine, be a (2314) small difference against the movement through Portland, and I do not think the difference would be large enough to be a controlling factor at all.

Q. Yes. In your Exhibit 16 you made some specific recommendations that were based upon the assumption that the Union Pacific system lines would be required to build its extension from Crane to Crescent Lake. Have you any other views now to express, or recommendations to make, with respect to what carrier or carriers ought or might reasonably be required to join in the expense of constructing this cross-State line; particularly in the light of questions that have been asked you by carrier counsel this morning?

A. I didn't choose that method of presentation because I thought it was of any particular advantage to the interests of the State to have the Union Pacific build to Crescent Lake, but in the first place, because I understand that it has always been regarded as territory that the Union Pacific expected to develop if anybody did, and that they wouldn't wish another carrier to invade it. Also, the method of presenting it, as the construction of one carrier made it somewhat simpler comparison than to attempt to specify the divisions that might be made, and, further, because it was rather a more difficult method to present and maintain the point that I expected would be shown by it. You observe here (2315) that I have figured here on quite liberal divisions of this traffic to protect the Southern
1245 Pacific in its earnings through Alturas, if and when that route were built, and if it had the earnings of the line as far as Crane, or if the junction were made at Ontario, I think the showing would be more favorable from the standpoint of what we are trying to prove here, because of the natural earnings that would fall to the Southern Pacific for the haul across that distance, and the Union, of course, would accept it there and would have terms that were more favorable than its acceptance at Crescent Lake—at Ogden. I think that from the standpoint of what the commission is trying to prove here we would make a better case on the assumption that the Southern Pacific were to build the line to Crane and operate to that point, or even take over the line as far as Ontario and make that their junction.

As to giving any consideration to the possibility of the Great Northern Railway being required to join in the expense of the construction of this line and to use it when built as part of its system in the State of Oregon; I can see no objections to their doing it if they wanted to. I don't quite see where advantage would come to them out of their doing it, such as that there ought to be any force brought to bear on them to induce them to.

As to the advantage from the standpoint of competitive rail (2316) services to the territory traversed by the cross-State line would accrue from its construction by more than one system of railroads, instead of alone by the Union Pacific system lines, say by the Southern Pacific and the Great Northern along with the Union Pacific system

lines, I presume there would be some advantages to them in the competition between the carriers to get their business. I don't know whether that would be a matter of importance or not.

Undoubtedly if the Great Northern were one of the carriers required to join in the construction of this cross-State line, that that circumstance would have bearing on the greater utilization of the cross-State line for the movement of lumber traffic originating both at Bend and at Klamath Falls; they would reach
1246 some territory, they might originate freight going into territory where they could utilize the cross-State line, and, of course, then would have the advantage of that much longer haul to themselves. They do not, I think, now reach much territory already with their own lines such that they could divert the traffic to any advantage here, because of short-hauling themselves, but they would undoubtedly get some traffic that they would want to take over such a line. (2317.)

Comr. McMANAMY. How far would they take it, do you know?

A. Well, to Crane, that would be all, if they joined in building it that far.

Comr. McMANAMY. And that would necessitate some sort of a terminal at Crane?

A. Yes; there would have to be some sort of a division point there that would permit of interchange of traffic.

As to whether I have any information about how the lumber traffic of the Oregon Electric compares in volume with the lumber traffic originated by the Southern Pacific in the western Oregon. (2318.) Not as Oregon Electric alone. I don't recall whether the S. P. & S. reports would give the Oregon Electric as a subsidiary or not. The S. P. & S. figures are given on page 131. It is my understanding that the Oregon Electric handles very little lumber now. The S. P. & S. figures shown on page 131 of Exhibit 16 include all of the traffic originated by the S. P. & S. in the State of Oregon, including the Astoria line, where they would get most of it. I believe there is a substantial volume of lumber and forest products originated by the S. P. & S. on its line between Portland and Astoria and Seaside. If you will notice the way that is worded there on page 131, I have taken for the O.-W. only the lumber originated, but I took for the S. P. & S. what it and its connections handled. Now those connections would be the Oregon Trunk and the Oregon Electric. My figure of 16.379 cars would include everything
1247 originated by the Oregon Trunk and the lumber it originates from the Bend Mills, and everything originated by the Oregon Electric in the Willamette Valley, as well as the lumber originated in the lumber mills on the line between Portland and Astoria and (2319) Seaside. I suppose that would include the traffic originated by the subsidiary of the S. P. & S. at Vernonia, the Oregon American Lumber Company there; The United Railways and The Central Coal & Coke Company.

Q. Now Mr. Dey asked you a question or two based on your report of 1925 introduced in evidence in the Klamath Basin cases, in which you had suggested common use of certain lines of the Southern Pacific in the Willamette Valley by the Union Pacific, and you explained that you used the words "Willamette Valley" in that sense as extending south to Eugene. Now in your study and testimony in this case have you substituted any other suggestions or recommendations for that suggested common user that you made in 1925; if so, what is the substitute?

A. I have substituted here the recommendation as to the interchange at Crescent Lake under rates and divisions that would protect the Southern Pacific, and at the same time be profitable to the Union Pacific. No question of common user has (2320) been raised, I believe, in this case. I do not understand that the petition calls for any such.

Q. Mr. Newell in that connection did you have in mind that the petition in this case had suggested common use by the different carriers to the extent prescribed or ordered by the commission, of the new line, the construction of which the State commission is asking for here, namely, from Crane to Crescent Lake? Did you have that in mind?

A. Well, I didn't know that that had been suggested in the petition. I have not treated it as a line to be operated by any one but the Union Pacific, and on the assumption that the Union Pacific solely were required to build it. The petition is broader in
1248 that respect than my answer was and I didn't have that particular allegation of the petition in mind in making my answer.

Exam. ROGERS. Do you think, Mr. Newell, that the substitution of common user of the extension between Crane and Crescent Lake would serve as a substitute for common user of the Natron cut-off; say, between Eugene and Crescent Lake?

A. No; I don't think it would. The idea of common user there was as a means of permitting the Union Pacific to come within (2321) reach of the traffic of the Willamette Valley and have a chance to solicit and obtain it. Now I have substituted here the recommendation of a compulsory interchange under conditions shown to be practicable. And as regards the use in the other direction, I think, as far as I see the problem, it would be a question simply of the interest of the carriers.

In 1925 in connection with my report on proposed railroad extensions to the Oregon commisison, I did not at that time recommend or suggest a compulsory interchange of traffic under specified divisional arrangements, such as I have proposed and recommended in this case. I did not know then that such a thing was practical at all. Recent studies have shown that.

I was asked some questions based on statements in this 1925 report I made to the Oregon commission about the character of country along a stretch of some 65 miles following the route of the pro-

posed cross-State line, in which I used the word "barren" in my former report. I had not seen that 65 miles there referred to at the time that report was made. Since that time and before the hearing in this case I have seen that country and formed a different judgment about (2322) its character. I have seen the greater part of it and formed a very different judgment as to its character. In my present judgment I regard it as a very good range country and a country in which it is quite practicable for stock to be raised and water found sufficient for domestic use and for the use of cattle, the country showing large sagebrush and a good growth of grass.

1249 I didn't explore for water over there, but the country is dotted there with homesteaders' houses that they have abandoned because they had no transportation, and every one of those must have had a well. They could not have lived otherwise. And settlers in there told us that wells would give water over a great part of that country. I have never raised any cattle in it; other witnesses, I am told, have testified here as to that fact.

Q. (By Mr. McCulloch.) Mr. Newell, on pages 132 and following of your Exhibit 16, you have shown for a period of five years traffic of the cross-State line, and for each year it is divided between traffic diverted and traffic created. Has your Exhibit 16, or your testimony, given any explanation of it and on cross-examination, contemplated this diversion of traffic (2323) for a period of more than five years?

A. That is as long a period as I have covered in my showing here.

Q. On page 133 in Table 19, showing westbound traffic from Crane, you have shown cars of various commodities, such as corn, feed, hay, and various kinds of livestock. Is this table meant to indicate that in your judgment this tonnage westbound from Crane is now being produced, or will be produced, in the territory immediately adjacent to Crane and will be loaded at that point into cars?

A. No; not necessarily. It would include such traffic, but it would include also, as regards particularly the first three items, corn, feed, and hay, those commodities wherever they might originate. Corn might be coming from Nebraska; some hay might be coming from Malheur County, some of it might be coming from Idaho. The same with feed. Those are based upon Mr. Teutsch's estimates of the needs of western Oregon counties. He also presented estimates of the production of eastern Oregon counties of the same commodities, but they were not included in my tabulations, because that would be a duplication.

1250 When we adjourned I made just the same statement. Whenever we do get (2324) that Idaho traffic straightened out so that we know that we have it right, without duplication, then I shall present it.

I have recommended a compulsory interchange of traffic at Crescent Lake under specified divisional arrangements. I do not see that there would be anything objectionable if the commission

undertook to make a similar requirement for compulsory interchange of traffic via the Portland gateway from certain territory in western Oregon lying, from the standpoint of distance and of appoximately equal cost and specified joint rate arrangement via the Portland gateway as well. The case does not present such marked contrasts of cost, and the volume of traffic which would be subject to that is much smaller than the other. I say "much smaller"; I want the record to stand that way.

I was asked whether the shippers of lumber from western Oregon, and of pears and other traffic, in my judgment would route their traffic for movement via the cross-State line if it were built. I have not received any information from talking with any of such shippers, or from any other source, to enable me to say or express an intelligent opinion of what they would be likely to do in (2325) that respect. I qualified my answer to the effect that that is something I didn't know much about, and I haven't heard the testimony of the witnesses in this case at all. I have not been able to attend any of the hearings, except as I have had to testify myself. And I recognize that there may be conditions under which the shippers will be quite anxious to exercise that right, but how far it would go I don't know.

I have driven over the route of the Rogerson-Wells line. I have seen it. The wagon road follows quite closely to the railroad quite a great part of the distance. I have not ridden over 1251 it on train. It happened there was no train running the day I was there and I didn't care to wait another day. Anything that I have said in my testimony with respect to the character of the country traversed by the Rogerson-Wells line, or matters of that kind, has been given in the light of a trip I have made through that entire country closely paralleling the railroad; in October of last year. (2326.) That is the Rogerson-Wells line I am referring to.

Q. (By Mr. ELLIS.) Mr. Newell, in answer to some questions of Examiner Rogers with respect to what would be required to justify the construction of this line, I am wondering if you could make yourself a little clearer. Just how much of the western Oregon traffic do you have in mind will be necessary in addition to the Idaho traffic and the traffic to be created along the line as well as in southeastern Oregon—how much did you have in mind would be necessary to justify the construction?

A. That is rather a hard question to answer. It did not seem to me necessary to consider that here, when it was shown to be so ample for that purpose. I have not, in my thinking of the matter, tried to determine exactly how small a traffic would justify that. My table 22 on page 142 shows a four and a half per cent return for the first year, even on the basis of the Alturas line being built at once, and the division of rates, the earnings allotted to the cross-State line made on that lower basis. I really don't know how small

an earning for the first year would justify the building of a line, or the compulsory building of it. I have for the fifth year up (2327) to 8.4 per cent, and both of these figures will be increased—well, quite materially increased—when we get the Idaho figures.

Exam. ROGERS. What proportion of the total revenues that you figure the line would earn come from this western Oregon eastbound tonnage?

1252 A. Well, I could pick that out of these exhibits and answer that question intelligently, if I might do that when I come in with this Idaho exhibit. I don't like to answer it off-hand now.

Exam. ROGERS. That is really the question Mr. Ellis is getting at, isn't it?

A. I take it to be; yes. I can make some study of that. I can take the figures out of here and do it, whereas I would only guess at it now. I had in mind in my answer and suggestion that the line should be made profitable and pay a substantial return the first year, even considering the immediate construction of the Modoc Northern; that it would earn something at least right in the beginning; I mean over and above expenses.

In answering the question: Did I intend to suggest to the commission that in my opinion such a showing should be expected in a case of this kind (2328), or did I merely suggest that was the basis that I had assumed in my study, I think I would answer it this way: It does not seem to me that in order to be justified in the construction of the road that it must earn a standard return, or near that, the first year. I don't think anybody expects that ordinarily of a new road. And finding that on this showing and the plan proposed that it would do it, that is the reason I say that with that traffic it is very amply shown. How much that might be reduced and be satisfactory I would want some time to think over before I even expressed an opinion. (2329.)

(Thereupon, at 12.27 o'clock p. m. a recess was taken until 1.30 o'clock p. m. Wednesday, August 15, 1928.)

After recess

J. P. NEWELL thereupon resumed the witness stand, and testified further as follows: (2330.)

Recross-examination—Contd.

My estimate of business turned over eastbound to the proposed cross-State line at Crescent Lake amounts to nearly two train
1253 loads a day of 56 cars each, or something less than forty thousand cars for the first year. I have estimated it at about thirty-three thousand cars for the first year, that, however, not all being turned over at Crescent Lake, that including traffic from Klamath and southern Oregon. What it would amount to if the Klamath cars were eliminated you will find on page 141. It would amount to about twenty-three thousand cars eastbound for the first year, and

rising to about thirty-four thousand for the fifth year. In other words, increasing the traffic in those five years a little over 40 per cent. I do not know of any railroad in this country that has been built and operated some time that has had any such growth as that. (2331.) To handle that business, of course, a considerable number of empties will have to be hauled west. The total westbound movement of traffic created as reflected by Table XIX, on page 133, is 3,777 cars; I have put no other traffic in here. Not all of this traffic created, is traffic that will be taken from some point beyond Crane, but most of it.

As to Crane and Burns combined originating but two cars a day and the bulk of it will be originated from beyond Crane and Burns, I don't know myself. I go to Mr. Teutsch for the points of origination. I am not prepared to testify. He has stated where the points of origination are, and I have simply collected his information, that is all. They can be traced through these various tables. (2332.) I am taking the statements that Mr. Teutsch has furnished and put them in order in Table XVI, showing the points of origination of this traffic and its destination, then in Table XIX, I deal with it only from the standpoint of its cost, and, therefore, show in Table XIX only the portion of the Cascade line over which that traffic would move, but originates or terminates in the case of a few commodities. Those are all taken from Mr. Teutsch. Those are all the commodities that are supposed to originate in that territory. You will
1254 notice in the lower part of the table, under "westbound," there are certain counties preceded by the word "to," meaning that the corn and feed and hay are moving into those counties, the point of origin of that traffic not being designated. You will note, also, that under Malheur and Harney for wheat, and in the third and subsequent years for hay and barley, certain figures in parentheses; those are Mr. Teutsch's estimates of the traffic originating in those counties, but inasmuch as it is included again in the list of counties to which that traffic is moving it is marked in parentheses here and not included in the summaries of traffic on which earnings are estimated. That does not account for the shrink from his estimate on (2333) page 125 from 4,628 cars westbound to 3,777 in Table XIX; that is, on page 133, in Table XIX, is the first year, and corresponds to the figures on page 124 in Table XVI, whereas for the third year——

Q. Oh, yes; this is the third year I am looking at.

A. Yes; the figures of eastbound and westbound in Table XVI corresponding to the figures for the same years in Table XIX.

If this business is going to move in such great preponderating weight eastbound, there will be increased business, of course, moving through Crescent Lake, and require corresponding accommodations for it. The conditions there for a yard operated by a railroad, with respect to topography of the country and snow conditions are not the best, but they must take care of this traffic in any event if it

goes south. The capacity wouldn't need to be very much increased for the purpose of the interchange.

I presume there would be some advantage in a road being able to reach its terminal where it is necessary for it to furnish volume of equipment like this. Where 20,000 cars a year or more must be hauled in empty there is some advantage of having the business (2334) of the railroad reach its terminal—Portland, for instance, of the O.-W. R. & N. Some provision would have to be made 1255 such as is at Portland. There would be the natural requirements of a division point, of course. It is true you make a lot of empties at a terminal like Portland, where all this business is concentrated and where so much of it originates and receives destination. The traffic delivered here, of course, furnishes empty cars for the traffic going east. Empty cars at Crescent Lake wouldn't be required. They would all be moved on through Crescent Lake to the Willamette Valley or other points where the traffic would be expected to originate. That would be merely a division point.

Before adjournment I stated that I assumed the Union Pacific was the one to build across here, or words to that effect, because I have always understood that this was the territory that the Union Pacific wanted to hold to its rails. As to that understanding being had before the producing territory in the Klamath Basin and at Bend was reached and developed by two competing lines of railroad (2335); as I understand it, they had that view of it before that time and since. I have never understood that made any difference in their regard toward the central Oregon country. Of course, it meant that the other roads had preceded them into a part of that country.

I do not contemplate that any more railroads are needed down to Klamath Falls itself; I don't see any reason for any more carriers going in there. Certainly not with any more tracks.

I have said that I am impressed now that the central Oregon country there for a distance of 65 or 70 miles is not a barren country; not as I described it before. Of course, it is an arid country. I had not been through that central part of it several times before, and I don't know what the frost conditions in that country are throughout the year; but I assume them to be rather bad, because all of that 1256 high altitude has trouble with frost. As to it being the most severe of the entire part of the country; that high desert; I don't know that. It is but very little higher, if at all, than the rest of the country. It isn't so very high. (2336.)

Q. If you have killing frosts with the thermometer as low as 26 degrees, and below for several days each month of the year except for the months of July and August, and then two or three days each month, over a period of nine consecutive years on an average, would you still think that that country would be a good agricultural country?

A. I don't now think it would be a good agricultural country, and have not so stated, except in certain parts of it. I have seen something of the changes brought about in some of that territory by cultivation and improvement. I can remember when I first went into the Grande Ronde Valley, nobody thought they could raise anything in there in the way of a garden, except in a few little isolated points, little coves off in the hills. Since that time I have seen them raising tomatoes in the open air in some of that territory, a most remarkable change as regards the ability of the country to raise crops in spite of frost. The elevation of the Grande Ronde country is about twenty-seven hundred, as I recall, a lower elevation than this. When I first went in—I spent one summer, about 1910, in the Walker Basin in around Lapine——

Q. Let's stay in Grande Ronde just a minute. The Grande Ronde Valley raises and exports cherries and strawberries (2337), and deciduous fruits, and a great variety of products of that kind, does it not?

A. I believe there is a very considerable variety there now. In the cove there, a large volume of the most tender and sensitive fruits that are grown are raised and shipped commercially.

I haven't made any such comparison between that location and Christmas Lake Valley. I was merely pointing out that in
1257 1891 when we built the Elgin branch into that territory there, that the farmers thought they could not raise anything on account of frost over all that valley, except in places like the coves and little isolated protected sections up in the foothills, and the condition is wholly different now. That is a well watered country too. It is a well watered country there, and there is that difference. And in the Walker Basin, at an elevation of 4,200 to 4,300 feet, in 1910 I saw in August, in the mornings ice a quarter of an inch thick on the top of the buckets after the horses were watered. I have seen it freeze after sunrise. And since that time I have seen them raise strawberries, and quite a considerable variety of crops, right in that same territory, when they clear it off and get it cultivated; and of (2338) course they are putting water on it. Lapine is the center of the Walker Basin; it lies just north of the intersection between the cross-State line and the Great Northern.

Q. That is a forest country, in the first place, isn't it?

A. Well, the clearing off of the forest reduces the frost. The people at Wagontire told us in the midst of this and at a higher elevation than the other they had no trouble to raise garden, and I understand, I have been told—I think it has been testified here that Ernst is able to raise crops in Christmas Lake Valley in spite of any frost trouble. I understand he has expanded his little oasis in the desert since the hearing in this case some four or five years ago very greatly. It was larger when I saw it—I don't remember just when I did see it, but I have been told by the witnesses who have been there that it has been very much expanded since that time. He

may have had the same amount of land, 60 acres at the last hearing and 60 acres at this time, but he has certainly extended the watering of it to a very great extent, the cultivation of it. As to that being in
a district where they propose to reclaim (2339) about 46,000
1258 or 48,000 acres: I don't know what the limit is to their pro-
posed reclamation. It is a very large tract. I didn't hear the testimony of the petitioners' witnesses here, and interveners', about the condition there in central Oregon. I haven't heard any of the witnesses in this case.

Q. Well, isn't it a condition wherein grazing is only possible after the rains come in the fall and until the storms are so severe in the winter that they are required to take them off, and then in the spring and early summer until the pools dry up? Do you think that is a country that will be productive of a substantial tonnage for the support of a railroad?

A. I haven't made any estimate myself of tonnage in there. The statements which you quote there are not in accordance with statements made to me by men on the ground and in the country. Of my own knowledge I can't profess to speak; I only know what I saw.

Q. In the hearing of the previous case, I. C. C. Docket 14,392, I will ask you if, in response to the following question, you answered as follows: "Question: Now if the traffic suggested from the Southern Pacific territory that is tributary to existing Southern Pacific lines of railroad is not available for this line," referring to the cross-State (2340) line, "and if this line across the State is to go from Crane to Odell junction and stop there, under those considerations it would be a very serious problem to maintain it or support it at all, wouldn't it? Answer: Most assuredly." Was that your testimony at that time?

A. I believe so. That is the way I desire to be understood now, if it is not to get any of that traffic I should say the same thing. It was my opinion then "That under those conditions it would be a branch line and nothing more nor less than a branch line. I doubt that anyone would contemplate building such a line to Odell without
some practical certainty of reaching some of that Southern
1259 Pacific traffic. The obvious thing to do would be to build
to Bend instead of to Odell, if any such condition were to be contemplated. Then it would become a secondary line of the O.-W. R. & N." That is my opinion now.

Q. Question, reading from page 1312: "And if it was so classified as a branch line, it would not have very heavy traffic, would it? Answer: It certainly would not; that is, it would not have anything like this traffic; it might have a moderate traffic for a branch line, if it were built to tap that timber (2341) between Bend and Odell and some other timber down toward Lakeview. But of course no one contemplates building a road under any such conditions as that at all." Was that your answer?

A. I have no doubt it was. As to whether that is the way I look at the problem at this time: The testimony which has been produced here, and which has been given me to work upon, would indicate that I would not need to be quite so positive in regard to that, but still I do not think it would justify an order to build.

Q. (By Mr. DEY.) You spoke on your redirect examination, Mr. Newell, of the Southern Pacific building this line from Crescent Lake to Crane, or participating in such construction. Now, you are aware are you not, from the Klamath Basin cases, in which application was made for authority to construct the Alturas line, that the Southern Pacific Company, in projecting that line, in asking authority to build it, relied upon the same western Oregon traffic to support it, did they not?

A. I am not very clear about that. I don't recall just what I saw when I read the application, but I know that I was surprised to find how little importance they appeared to attach to the movement of this traffic out of western Oregon and the economy to result in it. It did not seem to me they made their case in their application anything like as strong as they should have done (2342), 1260 but I don't recall just what it said, and I may be somewhat in error in regard to that. It seemed to me they were relying chiefly upon local traffic as the justification for their application. It surprised me very much to find that.

Q. Well, I don't know where you got that impression, I am sure. You would not expect, would you, the Southern Pacific Company to make the very substantial investment that is involved in this cross-State line, when it is now building the Alturas line, which is clearly a competitive line? You would not expect that, would you?

A. Why, on the showing that I have made there, that they could be allowed to earn as much net earning by the haul to Crescent Lake as they would make if they built the Alturas line and hauled the freight over it to Ogden, I can't see where there would be any objection to entering into it. To make money is what they want, of course, and if they can make it in one place better than the other, they would prefer to make it there, even though it might make it necessary to carry it——

Q. That would cause——

A. Pardon me, I haven't completed my answer. I think the Alturas line will be justified as a local line, as it goes through a lot of timber. It doesn't go through any timber until it gets over toward Alturas, but it does go through a very rich agricultural district (2343) all the way to the timber, 30 miles or so, and then a good body of timber. I would not consider that as an unjustifiable investment, although I do not know whether it is precisely sufficient to justify it, but certainly it has a considerable justification in its local territory. And if now the Southern Pacific can be allowed as big a net earning on a hundred-mile haul as it would get out of a thousand-mile haul, it surely is not being badly treated in the deal.

1261 I do not know what purposes the Southern Pacific Company had in mind in building the Alturas line. The purpose of the Interstate Commerce Commission had in granting authority to build it undoubtedly would be to grant a reasonable request, a request presumably reasonable, because the carrier made it in this case, there being no objection on anybody's part and the desire on the part of the company that it be built.

Exam. ROGERS. Mr. Newell, why is it proposed that this line go from Crane instead of Burns?

A. Because Burns lies up a little valley which would make it (2344) difficult of access. The natural connection across the country would be at some point close to Crane. Direct access through Burns would be difficult.

Exam. ROGER. As I understand your Exhibit 16, you only considered there the operating expenses?

A. Yes.

Exam. ROGERS. You did not apply the operating ratio to the operating expenses, did you?

A. No; I have my own calculations of these direct costs, and then when I came to the question of earnings of the cross-State line itself, I included the indirect costs, that is that part of the maintenance which would be independent of the traffic and the return—not the return on the investment, because I calculate that after having taken the other out, but I include the indirect cost of indirect maintenance and operating expenses and taxes.

Exam. ROGERS. Did you allocate anything, rather any part of the expenses that are taken care of by the operating ratio to the cross-State line? For example, take the president's salary, was any part of that allocated to the cross-State line?

A. Yes; but not as a specific item. I make a comparison of the indirect costs of other lines, which would include that, and from that

1262 I estimate the indirect cost, which ought to be attributed to the cross-State line.

Exam. ROGERS. Your cost figures as to the cost of this (2345) construction, as I understand Exhibit 16, are predicated upon a study made and introduced in the previous record?

A. Not entirely. That has been supplemented by a similar study of the Oregon Short Line, which was not introduced in the other case. The cost of construction was not introduced in the other case, the testimony in regard to it, the study of the Oregon Short Line costs.

Exam. ROGERS. The cost of construction?

A. I thought you meant the cost of operation. I used for the cost of construction of the cross-State line the estimate made and introduced in the former case. I understand it has been stipulated into this evidence here, this record. (2346.)

Exam. ROGERS. That is what I was interested in. All we have now is the unsupported figure, so to speak, of so much per mile. At Crescent Lake, if, say, the Union Pacific built the cross-State

line, would that necessitate the Union Pacific building a yard at Crescent Lake in addition to the yard that is there now for the Southern Pacific?

A. No doubt there would have to be some additional yard built there.

Exam. ROGERS. Was that taken into consideration in the cost there?

A. Not as a specific item, but Mr. Abry had made complete estimate, which was introduced, on which he was cross-examined in the other case, and he had included those facilities. I am not able to testify as to exactly what he had.

Mr. SPENCER. The records show, as a matter of fact, the other case contemplated on the part of the petitioners a common-user operation into Eugene, as I understood it.

1263 Exam. ROGERS. That was my impression. That is the reason I asked the question. I didn't understand from the other case (2347) there would be any stopping of the trains at this junction point at all; that they went on through to some point over on the Southern Pacific.

The WITNESS. Well, it would at least be a division point for both roads.

Exam. ROGERS. Necessarily?

A. Well, practically; I would say, yes.

Comr. MCMANAMY. Is it a division point now?

A. It is now a division point. It is at the summit of a very high grade.

I have been to the station of Crescent Lake; undoubtedly there is no layout there that was designed to contemplate any interchange at all; to take care of any interchange at all there; simply a station on the Southern Pacific's Cascade line where they change crews and sometimes change engines, and have necessary sidetracks for that purpose, and that is all there is to it. If this went through as I proposed I think it would be necessary to maintain switch engines and yard crews up there. (2348.)

Exam. ROGERS. How much of a yard do you suppose would be necessary?

A. Well, I haven't attempted any study of that. I added what I thought was a very liberal allowance for the extra mileage, ten miles or so, to what Mr. Abry had figured, using a considerably larger figure per mile than was shown by the average of his estimates, and I think that would be sufficient to care for all the needs that would be involved there, including the yard. I didn't attempt to draw any plans or make any estimates for the yard needed.

Exam. ROGERS. I was just wondering in my own mind whether it would be a difficult yard operation with snow, as it has been intimated occurs, upon the mountains there.

1264 A. It would not be an easy place. It would be rather difficult conditions, it is true, conditions through which it is neces-

sary to move this freight in any case, the only difference of it being the transfer of it to another carrier at that point. (2349.)

Exam. ROGERS. When you introduced your cost study in the grain case, as I understood from the newspaper accounts, one of the criticisms that the carriers offered was that you were attempting to derive a figure from all commodities and all tonnage and apply that to the transportation of wheat; is that right?

A. That criticism was made. I did derive an average figure, and with some modifications applied it to the haul of wheat, n y stand being that there was practically but very little difference in the operations of hauling one commodity from another, making allowance for the difference in loading it, and so forth, considering it after it gets on the road. The differences would lie chiefly in the terminal expenses. There would be, of course, as regards certain commodities like stock and refrigerator stuff, certain other requirements, watering, icing, and so forth.

Exam. ROGERS. I was just wondering, if the preponderating traffic over here is lumber, whether any objection that would be sustainable in the other case as to wheat would be offered here as to lumber, or whether the objections as offered in the other case would not be presented here because here you were dealing with all commodities?

A. I don't myself think of anything that would be pertinent of those objections here. I answered the objections to my own satisfaction in the case there. I don't know whether (2350) it was to the satisfaction of the attorneys on the other side, but there is this difference in regard to it, that the natural desire of the carriers in that case would have been to show that all of my costs were too low, derived by this same method, where as the natural desire here would be to show them too high.

1265 As to where there has appeared here anything that indicates a desire to show that they are too high: I haven't said that you have shown any desire, but if you were to attempt to upset my conclusions as regards the relations of costs and rates the thing for you to do would be to show that they were too high—my figures of direct cost I refer to.

Exam. ROGERS. Did you figure that any additional locomotives or cars or other equipment would be necessary on the part of any of the defendant carriers in order to operate this line?

A. That comes in automatically in here by inclusion of interest on equipment as a feature in direct cost.

Exam. ROGERS. You can take care of it?

A. Yes; that takes care of that automatically. (2351.)

Further redirect examination:

I came back over the route of the Alturas line of the Southern Pacific last fall. I came over the line from Klamath Falls to Alturas over the stage, observing as closely as I could where the road would go; that was last October.

As to further information respecting the elevations overcome on the route of the Southern Pacific from the Willamette Valley through Roseville and east; I don't know that I have it right available. I have used it in my calculations of cost. I had to know those elevations in order to figure the grades and the resistance overcome.

Further recross-examination:

Q. (By Mr. SPENCER.) The testimony developed by the examiner here with respect to your figures used by your study, that you used in the grain rate hearing, 17,000, you made that study the basis for contention by petitioners in this case for (2352) a reduction of 50 per cent in the grain rates in this State, did you not?

1266 A. That is not quite correct. That study was begun, and, in fact, as far as its cost elements were concerned, was finished before the grain rate case was begun at all. It was prepared for this case, and then when the grain case came up I extended it as regards wheat. I haven't cut the rates 50 per cent on lumber, or 50 per cent on any other rates, in arriving at the revenue that is going to make this return to the operation of the cross-State line, not at all. I have taken the figures of earnings as Mr. Wiggins calculated them, I believe a very small portion of it is wheat.

Exam. ROGERS. Well, in figuring the earning on wheat, such as is calculated in here, have you figured them at the 50 per cent reduction, or——

A. The fact of the matter is, on second thought, I believe there is no wheat whatever included here. Let me look. There is a showing of production of wheat in that eastern Oregon country, but I have cut it all out, because I considered it a duplication of the feed estimated to go into western Oregon counties, over this line, so there is no wheat involved here. The only question would be on the obligation with respect to the reduction in the rates of feed, and I can't say what Mr. Wiggins did with them. (2353.)

I did not say in the grain rate case that I thought that all of the carriers are earning too much money, I never said so at all. The indications are to the contrary.

Exam. ROGERS. Then the conclusion would be that the increase on wheat would be offset by an increase on other commodities?

A. That would be the natural conclusion. I didn't go into that, because I wasn't informed as to what other commodities would be affected. I think my figures here have shown earnings on lumber at a loss at the rates existing.

Exam. ROGERS. Then your earnings on lumber, in that case

1267 might be an issue.

A. Well, I see nothing in here to cause any thought that they might be decreased at all, but they do show a practicable loss by the existing lines.

In mentioning taxes, I had in mind the item of taxes which I allocated to the cross-State line. The taxes on the cross-State line are in here, and, as I recall it, it is $120,000.00 (2354.)

GUY CORDON was thereupon produced as a witness on behalf of complainants, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Roseburg, Douglas County, Oregon; my official position in Douglas County is district attorney at the present time, of Douglas County; I have held that position since 1923. I have resided in Douglas County continuously for the last 28 years. I represent the Chamber of Commerce of Roseburg and the county court of Douglas County in appearing at this hearing. I am here representing both of those organizations. Both of these organizations are interveners in this case. (2355.)

I have some data prepared, for the purpose of this hearing, not in a presentable form, as written, from which I could give the information we have secured.

In presenting to the commission the views of my community and any facts bearing on the desirability of the construction of the cross-State line, I may say, by way of explanation, that Douglas County, while having arbitrary limits, is practically co-incidental in its boundaries with the watershed of the Umpqua River, represents about five thousand square miles of territory reaching from the Cascades to the Pacific Ocean. It has at the present time a population of slightly over four to the square mile, including the urban population.

The section has never had rail transportation other than the main line of the Southern Pacific, which, by the way, extends
1268 for over 116 miles through our country alone, until about 15 years ago, when the branch line from Eugene was built to Marshfield. That crosses the most westerly portion of the county.

The only method of getting the products of that section to (2356) market during all these years has been the one trunk line of the Southern Pacific. We represent, I believe, a section about as far removed from any transcontinental line as there is in the westerly part of the United States. Our products must needs go either 200 miles north to Portland before they can start east or about three times that distance southerly into California before they can start east. As a result, we are, of course, vitally interested in any proposed construction of railway transportation that will cut down for us that lost distance.

Now, the transportation petitioned for would do that, because we could send out commodities north about 75 miles to Eugene and then would be on the main line that would go direct to Crescent Lake or other connecting point, and through direct east.

Of course, we are more interested in seeing a cross-State railroad built through to the seaboard, but first considering the connection with the so-called Natron cut-off.

We have within our county several major products of a perishable nature, the chief one at the present time being our broccoli crop, or winter cauliflower. Due to an exceedingly mild winter climate, we

represent one of the very few sections competing with the semi-tropical portions of the United States in the production of winter cauliflower. (2357.) At the present time, due to the poor rail connections, that product is put on the eastern market, where, of course, it is all disposed of, about four days later than the same product from California. That is due to the fact that we must needs
1269 go around by Portland and through a congested terminal, and perhaps through another one at Spokane if it be routed that way, or else go down the Southern Pacific by Roseville and Ogden. My understanding is that the actual movement of the greater portion of the broccoli at the present time is routed north, through Portland. Now that product is peculiarly of a perishable nature, and it represents a big productive area of Douglas County. It is a new product in our section, comparatively new, at least; it was first grown there in 1913, and yet within that short time it has reached a maximum production in the county alone of 900 cars, in round numbers, a year. The crop as an annual crop is a valuable crop to us, due to the fact that it doesn't need several years to come in production.

The potential acreage in our county that could be used for our broccoli crop is in excess of ten times that actually used. Now, I have reference only to that acreage that could be profitably used for the crop. (2358.)

Any transportation system that would shorten our distance and time to the markets for that crop alone, would, of course, be a wonderful thing to our section of Oregon.

As to the production of broccoli being limited in any way during the past years: the limitation feature is a limitation, I would say, that is based upon the trouble with transportation. It must be sold in competition with a similar product from another section which can be put on the market earlier than ours can, and it could be vastly increased if we were put on an even footing with the other sections producing the same crop.

Exam. ROGERS. You said there was 900 cars of broccoli now a year?

A. That is the greatest yearly crop we have had. I think that was in 1926 it went to 900. 1927 is was less than that, due to a flood that took out a good share of the crop on the lowlands.
1270 I haven't the figures for last year.

Exam. ROGERS. That moved all by the Southern Pacific, did it?

A. It had to move that way.

Exam. ROGERS. Do you know where it moved to?

A. Well, to eastern markets, Chicago and New York. When I say it had to move Southern Pacific, I mean it originated on the Southern Pacific and there was no transportation from that section other (2359) than the Southern Pacific, except by truck. At the present time, that is.

The effect on the present production of broccoli the continuance of existing transportation conditions will have: It would necessarily follow that the crop would not be extended, and in all probability would be restricted. There is no reason to expect a heavier acreage than is now planted under the present conditions of transportation that we have to face.

Just what the growers of my community have done to overcome their distance handicaps by improved methods of packing and shipping, I don't know. So far as packing goes, broccoli is a vegetable crated, and the shipping, of course, must necessarily be taken care of as other perishable fruit is, shipped under ice, it must be.

We produce other commodities of a perishable nature that are affected in a similar way by distance of transportation, particularly our fresh fruits. I think Mr. Norton, from our section, has been before you here and has discussed that matter somewhat in detail. In the last few years there (2360) has grown up a demand for what we call green prunes, which is a distinction between the fresh prunes and the dried prunes. Now, we have within Douglas County between fifteen and twenty per cent of the production of prunes in the Northwest—not in acreage, but in crop production. The greater portion of that, of course, is handled as the fresh or green fruit, and, of course, that is in the same situation exactly as the 1271 broccoli—it must reach its market fresh. The green fruit market is in the Middle West and the East, just like the broccoli market is.

As to what extent the transition to the shipment of green or fresh fruits been brought about by economic conditions or the condition of the market for dried fruit: Well, the market for dried fruit is practically restricted, it is limited, and the handling of the fresh fruit is an additional method of taking care of that particular type of a crop.

Q. Well, if you are not able to ship your fresh fruit through (2361) to market rapidly, so as to compete with other producing sections, will your country be able to continue to develop in the production of fruit through the use of drying methods, shipping them as dried products?

A. Well, of course, they can dry some portion of that, but the market that exists for that type of commodity, the fresh fruit, and a market that we could help in supplying, is close to us, and necessarily to that extent we are restricted and injured, can't help it.

My section of the country does not produce melons on a large scale. We produce melons, and they are sent, but I imagine that practically all of our melon market is in the West. I don't think there is much goes East, although there is a considerable market for our local products east of the Cascade Mountains, and it is now carried into that section by truck, and there is no real eastern market. We have, of course, the further products of mutton and turkeys—I

think perhaps within our county one of the greatest turkey shipping centers in the United States—and those things come practically under similar conditions.

I do not know on what basis our icing charges on fresh fruits and vegetables are assessed.

The other products in my county in which I (2362) am mainly interested from the standpoint of transportation to market
1272 are: Well, within the county there is a stand of commercial timber of substantially 55,000,000,000 feet, I mean timber that is now ready for cutting, classified as commercial timber. Now, that is practically untouched. I believe you heard here Mr. Fox who is one of the heaviest owners of timber within the county, and his situation is that of other private timber owners in our county.

We have a potential water power in the Umpqua River to operate all of the manufacturing concerns that would ever be needed for the reduction of that timber to all forms of manufactured article, and it is running down the river and going to waste, and will, for the simple reason that our two methods of outlet are closed, practically. We are within 80 miles of Coos Bay, which is now being improved by Federal aid, and the mouth of our own river, the port of Umpqua, which is a federally improved port. We can reach either of them without going north to Eugene and back south, making about fifty or sixty miles additional haul for nothing.

Our market for timber, or for lumber products, is twofold, it is the world market at Coos Bay and the seaboard, in the first place, and the interior market, that is, the main Mississippi Valley, in the second. (2363.)

Now, a manufactured article in the way of lumber products in Douglas County is under a handicap, for instance, with that produced in Jackson County. If it goes south toward the eastern section it must be hauled 110 miles farther and carries an additional rate. If it goes north it must needs go around the additional distance, and there is no transportation now except the one road, and it doesn't give us the facilities for carrying the lumber out.

There have been two major lumbering operations contemplated in our county in the last fifteen years, one of them by Kendall
1273 Lumber Company, and another one by Roach Timber Company. In both instances they were abandoned by the transportation question here extending. I think Mr. Fox told you about his connection with the Roach Timber Company.

Now, that timber must come out, and a railroad, if constructed on through to the seacoast, could tap the greater portion of that lumber—it would give an immediate method of access and an immediate market for the lumber, and much of the lumber is now ripe and going backward. It is probably the greatest undeveloped resource of the county at the present time, and is throttled.

For about ten years I was connected with the county (2364) assessor's office in Douglas County, three years county assessor. During that time a cruise of the timber was made, and there was a re-

appraisement of the lands of the county, farm lands. As a result of being connected with that work I have rather an intimate knowledge of the general situation in Douglas County, and there is a potential development there that is really remarkable. The county should have five times the population that it has now on lands that are of the highest degree of fertility, some of them now used for grazing where ten acres will support a family. That situation ought not to exist—would not exist if the products resulting from intensive farming could be disposed of by reaching a market. It can not. The result is that those crops that can be disposed of by the roundabout, circuitous route are raised, and sheep are fattened there, and cattle and the like, where intensive farming could be carried out. That is one of the situations there, and that is true down the main valley floor for seven miles. The people down there have really gotten to where they figure that the one outlet that they have carries rates that make it inequitable so far as they go, and they
1274 simply don't go forward,—they are standing marking time,—and any construction of transportation facilities within the State that will to any extent put them on a parity with other sections of the United States engaged in raising the same (2365) crops and the same distance to market will be a Godsend to that part of the country.

In completing my statement as to the resources available for development, I can give you some estimates. It might be well for you to understand the situation in the county from a climatic standpoint, because that is a dependent factor in considering the potential products of the county.

Now, that section of Oregon has the lowest average wind velocity in the United States, has an average annual precipitation of approximately thirty-three inches, and an average growing season of 227 days, that is, from one killing frost to the next. It is an extremely long growing season. It has very moderate temperature, the lowest recorded temperature being fourteen degrees above zero. It leaves a wide latitude for the growing of the tender types of vegetable products which are the perishable types. It is also an ideal country for poultry, and that industry is rapidly being established. There is room there for a very considerable development along that line, and the development will come without question, and will come, of course more quickly, more definitely, with increased transportation facilities. I have covered the timber. (2366.)

There is another matter that should be considered. In southern Douglas County and northern Josephine there is a considerable mining industry that is being developed more now that more improved method of ore reduction has been made. Those industries to a great extent are based on low grade ores, where transportation is a big factor. The development of that line of industry would be another one that would be affected by transportation.

1275 I don't recall any other matters that ought to be presented here. I have generalized on them, because I feel that any estimate as to potential crop in the future is more or less of a guess.

Q. Have you prepared some estimates of a general nature that you could give here as to the potential tonnages that might be available for movement over the Cascade line?

A. The chamber of commerce prepared some such figures, but based it on an area larger than just the county. They figured in Douglas and Coos Counties, figuring those two counties as being tributary to a cross-State line, and the figures compiled by the chamber as a safe estimate of potential tonnage available for a new railway line from eastern Oregon connecting with eastern points and traversing Douglas and Coos Counties to a western terminal on the seaboard would be as follows: (2367.)

Comr. McMANAMY. Have you any knowledge of those figures that you could be cross-examined on?

A. They are estimates, Mr. Commissioner, entirely, and I have a knowledge of the facts upon which they were based.

Exam. ROGERS. Do you have knowledge of the basis for the figures?

A. Yes.

Exam. ROGERS. Do you know how they were drawn?

A. Absolutely. (2368.)

Exam. ROGERS. Can you separate the figures in any way to make them relate to this cross-State line, rather than a line running over to the coast?

A. I don't believe that the figures that I have here could be so separated. They were grouped with two counties.

Exam. ROGERS. Well, what value do you see that they would be in this case in relation to the cross-State line?

1276 A. Well, they have value chiefly in any consideration that might be had to a terminal beyond the line of the one applied for, frankly.

As to what extent the tonnage included in this estimate might be expected to move to Eugene and thence via Crescent over the Cascade line: The tonnage from Coos County would be affected to some extent, I am not prepared to say to what extent, but that they would be an increase, for instance, in lumbering in Douglas County by reason of a shorter haul would seem reasonable.

Those figures were prepared with the thought that the construction from the coast through to Crescent would be expedited by the cross-State line, and they were prepared with the thought that this was potential tonnage that would in the future be available to the cross-State line (2369); that was the purpose, a cross-State line ultimately connecting with the seaboard.

The estimate is that there is a potential production of fresh fruit and broccoli of five thousand carloads annually. In explanation, I may say that the production has reached on broccoli alone 900 carloads, and, as I have stated before, that would not represent over, if,

ten per cent of the land adaptable for that one crop in Douglas County alone, and that crop is a better paying annual crop than any other raised in the county.

The estimate on dried prunes is 1,500 carloads. That estimate, of course, is based upon the present production of that fruit, with the possible increase that would come from orchards planted on adaptable tillable land within the county.

The lumber possibilities have been estimated at 25,000 carloads a year. Well, that is based upon the fact that there is between eighty and a hundred billion feet of merchantable timber within the two counties at the present time, that is, timber
1277 available for cutting. Some portion of that would go by the seaboard. Better than 75 per cent is tributary (2370) to the inland and would have to move over some rail transportation. I would say 75 per cent would go inland. Now, pardon me, I don't mean that it would go inland, but it is inland and would have to move over a transportation system, whether to the interior or to the coast. A portion of it might move in logs to the coast and be milled there at Tidewater. There is better than fifty billion feet of that that would have to move from sixty to one hundred fifty miles to be available in logs at the coast. That would naturally go by inland transportation. The other figures here I don't believe are such as would be of any interest or use to the commission. That concludes my statement.

Cross-examination:

Q. (By Mr. DEY.) Now, on that timber, Mr. Cordon, you say that it being located from sixty to one hundred fifty miles from the coast would necessitate its being transported inland and manufactured? (2371.)

A. When manufactured it wouldn't necessitate it at all. It could be moved either way. As to why it wouldn't go to the coast in the logs from this area lying between 60 and 150 miles from Tidewater: The transportation of logs for that distance, in my judgment, would in ordinary cases be prohibitory as against transportation of the manufactured product.

Q. Well, don't you know that we are hauling logs all over the State of Oregon for distances as long as that—in the Klamath Basin territory, and out here in the coast territory?

A. I imagine where the necessity of it is there. That wouldn't be here. Assuming that it is necessary to locate the mills at Tidewater, it would be necessary to move the logs there.

I am the district attorney of Douglas County; I am not engaged in any type of farming. (2372.)

1278 It would seem to me that the difference in time between the movement of our broccoli east from Roseburg and Douglas County and the movement from the broccoli producing sections of California would be four days. Now, I haven't checked a schedule of it. Those are the figures given me by those interested in broccoli shipments.

Q. All right, let's check it a little. Now, then, the broccoli district of California is principally at Colma, near San Francisco Bay, and some down, perhaps near the coast at Los Angeles, and that broccoli, particularly the Colma district, the principal one, being right on the Pacific Ocean, is moved to Granger, Wyoming, over the Central Pacific—or to Ogden, rather, over the Central Pacific Railroad, and your broccoli is brought to Portland and moved by the Union Pacific—O.-W. R. & N., Short Line and Union Pacific—to Granger, where the California broccoli meets it.

Now, do you know the running time between Roseburg, or Douglas County, and Portland on that broccoli, those distances are substantially the same? (2373.)

A. Well, I know the distance. I know that it is substantially 200 miles that it must move to get into Portland on the Southern Pacific line before it can be routed over whatever other line it goes, including its being held whatever time necessary in the terminal and being rerouted.

If you stated as a fact that it gets to Portland in 18 hours and is out of here inside of 24 hours all-told, I would assume it to be a fact; I don't know. When I state four days, those figures were given me by people in my section who handle broccoli, that they were four days late in their shipments over similar shipments from California. Those people (2374) were the growers of any size, or the principal growers in that section, I think the title of the organization is the Umpqua Broccoli Exchange, I think is the name of the 1279 organization, the manager, Mr. Butner.

I do not know what the broccoli shipments were in 1925, I have only the cars of 1926, which in round numbers was 900 cars. I haven't between '13 and '26, only that maxmum of '26. It was slightly less in '25, and on backwards to '13 when it originated in that section.

Q. Now, isn't it a fact—you were down there and living there—that in 1925 the frosts practically killed the crop?

A. They have had years—now, whether it was '25 or '24—when there has been a loss by frost, but, Mr. Dey, as a matter of fact in the one year that I have memory of when that was at all severe the very fact that a partial loss by frost held the balance of the crop down, the result in money was of no great difference. You understand, broccoli is perishable because it is late, not because it is early. As to any serious effects on our crops from floods, one time, when we had the one flood of its size known in (2375) that county for 35 years—that was in 1927.

Q. Now, in 1928 you had a small crop, and also low prices, did you not, on account of the competition fr m ——

A. In 1928, Mr. Dey, the crop is about that high (indicating). That is this year.

Q. Well, this last season?

A. Oh, we measure it from the year before, when we plant it. Last year's broccoli crop was an ordinary crop, I would say. It wasn't

a heavy crop. There wasn't as great an acreage as there had been before. I have an estimate here of 350 cars.

The greater portion of broccoli that is shipped from our district in Douglas County goes through Portland. They route it through Portland because it is shorter, is my understanding of it. (2376.)

Redirect examination:

1280 I do not know how long they have been routing their traffic through Portland. As to the information that would enable me to express an opinion as to whether or not with the construction of the cross-State line the products of my county would be routed via that line as against the present routing: From the general knowledge that I have gained there in my work with those people, the fact as Mr. Dey has stated that in any event there was a 24-hour loss by the northern route, it would be reasonable to believe, and I think I can safely say it to be a fact, that if the route were established through the central part of Oregon and a saving in time should be made that practically the whole of the perishable fruit and vegetable shipments would be routed that way.

Exam. ROGERS. Well, you would have another terminal movement over what you have now, if there was interchange at Eugene and then again at Crescent Lake.

A. There shouldn't be any terminal stop of any consequence in Eugene. The Southern Pacific connections would run you through at least to Crescent.

Exam. ROGERS. Well, they would have to break up the train at Eugene, wouldn't they, to get this broccoli out in any quantity? (2377.)

A. If they were shipping the amount in any quantity that would go from there it would go practically in train loads. The crops will naturally have an increase when there is a better market afforded by shorter transportation. From the standpoint of future development of our community, the construction of this cross-State line would be a vital thing in the development of our section.

Recross-examination:

Q. (By Mr. DEY.) By the way, have your people down there, heard of or taken any interest in the construction of the Alturas line?

A. Not that I know, Mr. Dey.

Q. (By Mr. SPENCER.) You say vital to the development
1281 of your section, when you refer to the cross-State line do you refer to the line to go through your country there and on to the coast?

A. I was so referring in connection with my estimated figures, Mr. Spencer, but in answer to this last question I had reference to a cross-State line that connected onto the present Southern Pacific Company. Of course, that won't be the benefit to us that a line connecting with the seaport would be (2378), but it would neverthe-

less be a benefit, because it would shorten our distance to our market. I don't see how it could help but shorten our time to Chicago. If it didn't, I don't know of any benefit we could get other than perhaps better service. Whether we would get that I don't know.

Q. You wouldn't get as good service if the other line took it and delivered it at faster time, no difference in the rate—you wouldn't be any better off?

A. The main thing we are interested in is time. The complaint we have of the service now, is simply that it takes too long. Of course, we have complained many and various times for lack of cars, and that sort of thing. That has been off and on for a good many years.

Q. But you don't think this cross-State line is going to induce the production of 5,000 cars of fruits and broccoli, do you, in Douglas County?

A. If there is an appreciable shortening of the time, so as to permit all of our products getting into markets, there will be without question a stimulation of the industry. The (2379) increases given there was predicated upon a building into the section which would put competing lines in the section, but even without that if there be a shortenng of time between the place where our products originate and where they are sold it will stimulate the production without any question. We have the land, and it isn't all put to use by any means, and is would be a profitable industry, and that will
1282 cause it to be developed.

Exam. ROGERS. How much shortening of time do you say would have to be before it would produce that result?

A. Well, anything that makes an appreciable length of time, from eight hours on up, would be a lessening of time in the handling of perishable goods. We figure in that section that the saving in miles alone ought to make a difference of at least two day, and from that to four, depending on which way the stuff has been routed.

Exam. ROGERS. Where does this broccoli move to?

A. Chiefly to Chicago and New York City.

Exam. ROGERS. It is marketed there pretty much on the daily markets—that is, the morning markets?

A. Yes; as a fresh vegetable.

Exam. ROGERS. If it doesn't get there in time for the morning market, and gets there later in the day, ten or twelve hours, might it just as well wait until the next morning?

A. Absolutely. (2380.)

Exam. ROGERS. So if you didn't speed it up twelve or fifteen hours so as to make it a day earlier on the market it wouldn't help much?

A. Depending, of course, on what time it now arrives—it might take twelve or fourteen hours to make a difference, and eight or ten might make the same difference.

I don't know whether it runs by a schedule to take it into Chicago on the Union Pacific-Northwestern route now. An observation of

that kind has not been discussed with me by these people with whom I have discussed the matter.

Q. Well, if it goes into a fruit block now after leaving Portland and goes by a schedule to make Chicago at a certain hour and for a certain market, you would have to meet that or better it by a whole day, or twenty-four hours, would you not, across the cross-State line?

1283 A. It all depends upon when your block got on the market there. I don't know when it would get there. A real practical proposition of getting it there as soon as possible. (2381.)

W. F. RAMSDELL was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

My full name is W. F. Ramsdell; I live in Portland and I work for the United States Forest Service in the capacity of assistant chief of the branch of forest management for the district of Oregon and Washington. Coming under the branch of forest management as duties performed; activities engaged in by that particular branch in the State of Oregon, for example, it handles or supervises the work of the officers of the various national forests in the matter of the sale of national forest timber, in the matter of preparing what we call management plans, or planning for the sale and the handling of national forest timber, and the policy under which that timber will be sold. Another principal duty is in connection with matters of reforestation. Those are the three principal ones.

The national forest management, has adopted and is following a plan of selling stumpage in the national forests for manufacture into (2382) lumber on a basis that will insure indefinitely into the future a sustained yield of timber. That is the basic policy of the United States Forest Service in handling its timber, the timber within its control, both in Oregon and elsewhere. The only exception to that is such bodies of timber, usually small in character, as are intermingled with, oh, greatly larger, predominating bodies of private timber; in other words where we do not control the situation. There of necessity we simply have to sell along with the private stumpage in any way that that is handled. In volume that probably does not exceed, I would say, ten per cent of our total. In other words, at least 90 per cent of our timber is handled on the sustained yield plan.

1284 The sustained yield plan and the basis for it: Well, the basic principle is to cut, in the long run, over a long period of years, no more than the growth of the timber from the land. In arriving at what might be called a cutting budget, a plan of cutting, we have to take into consideration the character of the timber which is already there, so that in some cases we may have a very heavy stand of over mature timber, for instance, and which it would be good business to (2383) somewhat overcut. In other cases, our timber may be young and thrifty, where it is better business to hold back, to a certain extent. When I mentioned a little bit ago the character

of the timber, I had in mind whether the timber was overripe or young and not yet fully mature.

The basic policy or plan of the Federal Forest Service does not depend upon the variety of timber, but the method in which it can be followed out does depend upon that.

An illustration of the working out of this policy in actual practice here in the section producing fir timber west of the Cascade Mountains and a particular operation where the Government has sold fir stumpage and give the details to illustrate my testimony is the sale of timber to the Anderson & Middleton Lumber Company of Cottage Grove. Now I have with me the plan, if I could refer to that. I could give the general figures, but I could give them a little more accurately by referring to the copies of our file for the plan of handling (2384) the timber that is sold to that company and for the stumpage which is tributary thereto.

In referring to my figures and in saying how much timber there is in the block or unit that has been sold to Anderson & Middleton Lumber Company, I believe it might be a little more clear if I would first give the figures for the territory which we handle
1285 as a unit, working circle unit, we call it, which is the territory within which a portion of the timber only has been sold to the Anderson-Middleton Company, but within which no more timber will be sold until this first unit is cut.

Now, this particular territory is in the watershed of what is known as Row River, with its tributary creeks. It lies in the north end of the Umpqua National Forest, all in Lane County, Oregon, east of Cottage Grove. Within this territory there is at present an estimated amount of 2,020,000,000 board feet of mature timber. Cutting that timber at the rate which has been determined upon of 40,000,000 feet per year, it takes fifty years to cut out that mature timber.

There is also in that territory a large acreage of immature timber, stuff which can not be considered merchantable now but which by the end of this fifty-year period will have (2385) a total stand, using our standard yield tables, which I believe have been discussed in connection with this hearing previously by Mr. Munger, of the experiment station, this one immature acreage would at that time, within fifty years, or at the end of the 50-year period, contain 1,140,000,000 feet. That would be mature timber, ready for cutting; the stuff which is now—oh, in the pole stage, immature timber, but with fifty years additional growth would come into the merchantable-size class. Then a small acreage of still younger timber—before that I should state that that 1,140,000,000 feet provides an additional 28-years' cut; that is, dropping the fractions. That fifty plus 28 makes at the end of the 78 years the third classification of young growth will have 755,000,000 feet of merchantable-size timber, and those three classifications make up the total acreage, stuff which is now immature, stuff which is in the pole size, and the stuff which is still younger, and that last body provides 19

years cut, giving us a total years of cutting run on that territory of 97 years, at the end of which time it would be necessary to
1286 start back where the first cutting began, and within which period, in this Douglas fir territory, merchantable timber can be grown.

Now that is the territory within which the sale to the (2386) Anderson-Middleton Company has been made.

From a seedling to a mature tree, ready for cutting, Douglas fir will take approximately one hundred years to grow. Those private interests who have looked into the matter most figure on a shorter life cycle, anywhere from 60 to 75 years, but the Government always figures on growing larger size stuff, and we figure anywhere on from 100 to 120 years.

Out of this whole circle of 2,020,000,000 feet of mature timber now in this area, 375,000,000 feet has been sold to Anderson & Middleton. By their contract with the Federal Forest Service they can not exceed the average annual cut of 40,000,000 feet a year. That average annual cut of 40,000,000 feet does not exceed the estimated annual growth of the timber in this entire block of 2,020,000,000 feet, not with the additional growth as previously explained, of the present pole size timber. By cutting at the rate of 40,000,000 feet, we have 97 years cut assured, and that has all been placed on what we believe to be a very conservative basis. In other words, out estimates of the growth on the (2387) young stuff we have discounted.

I have said that no other timber would be sold to anybody else in the block now containing 2,020,000,000 feet while the Anderson & Middleton Company was operating in the present 375,000,000 that it purchased. The only exception to that would be in case of some unforeseen calamity, such as a forest fire, which might kill a body of timber and it might be necessary to salvage it.

In determining the amount of acreage and the amount of stumpage to be included in any one of these circles I have mentioned, the considerations kept in mind: We select a territory which topographically lends itself to logging to some convenient
1287 milling point in a territory large enough to give a cut which makes it economically possible for the purchaser to operate, so he could not be restricted to so small a cut that he could not get in with railroads and make the necessary investments.

As to what the annual cut in thousand feet board measure will range between maximum and minimum limits under the contracts that the Federal Forest Service make: We have some where the working circles are as small as 10,000,000 feet. Now, particularly, in the yellow pine, we (2388) have situations where we don't necessarily sell to a single purchaser. We may cut up the cut to small mills; 40,000,000 is considered a fairly large size operation; although they vary from thirty to—I believe that fifty million is as large as we have made at the present time in the Douglas fir region.

Q. Now I wish you would give one illustration in the pine region of eastern Oregon, if you can. Are you familiar with the location

and management of the national forest yellow pine timber tributary to the line of railroad extending north from Burns to Seneca?

A. Yes, sir; I had a part in developing the plans for handling that timber.

There is 429,239 acres of loggable timberland in national forest timberland in that area. Our estimate of the volume of merchantable timber on that acreage is 5,466,000,000. (2389.) Our maximum annual cut from that area that would be permitted under this sustained yield policy of the Federal Forest Service is 73,000,000 feet. That is determined somewhat differently than with Douglas fir. In explaining how it is determined and the difference: The best practice in handling Douglas fir, both from the viewpoint of the logger and the forester, is too clear-cut, with the reservation merely of sufficient trees to assure a seed for the natural reseeding, while with yellow pine our system, and the system that is followed every-
1288 where, both by private and public agencies handling yellow pine timber under forestry practice, is to cut under what we call a selection system, selecting only the large mature and overmature trees and reserving all of the thrifty or younger trees, even though they may be of merchantable size. That results in that particular territory there in Grant and Harney Counties in cutting about 80 per cent of the present merchantable volume, reserving about 20 per cent of the present merchantable volume; and there is also reserved, of course, all of the younger growth in small saplings and poles not included in the merchantable stuff. (2390.)

The Forest Service has sold timber from this particular whole circle to the Edward Hines Western Pine Company. The volume which is under contract, which must be cut, is estimated at 770,000,000 feet, western yellow pine. The rate under their maximum annual cut will average 60,000,000, and I believe it figures out it will take it about thirteen years to cut the total of 770,000,000 feet.

At the end of that period of time, an additional block of timber will be advertised, sold to the highest bidder, and in that territory it will be a fairly large block of timber, several hundred million. It might be somewhat smaller than this first block.

A yellow pine tree will grow from saping to the size (2391) we wish to grow timber, which is a little larger than would have to be grown to be merchantable, in, we figure, 180 years in that yellow pine territory.

I do not have in mind with sufficient accuracy to quote it, the approximate amount of standing timber in all of the Federal forest reserves within the State of Oregon.

This policy that I have outlined of selling the timber and having it cut on a sustained yield basis is the policy that the Forest Service has adopted with respect to at least 90 per cent of all of the
1289 national forest timber in the State of Oregon. That is a conservative estimate, 90 per cent. The essence and gist of that policy is the selling of no more timber out of the national forests than natural growth will offset each year. That is true, taken over

a long period of years. We will, we believe, in Douglas fir, be able to increase our cut at the second cutting, while in general in the yellow pine our cut will be decreased somewhat the second cutting.

If that policy is followed and carried out, it will result in insuring an indefinite supply for the future of timber for sale and cutting out of the national forests in Oregon. (2392.) That is the primary purpose of the policy and would result in that.

Cross-examination:

I have been out here on the coast in this work continuously since 1914, except during the war in the service; that is fourteen years ago. I have jurisdiction over the Washintgon forests as well; out of this district office here in Portland.

In round figures the area of the national forests in Oregon is 13,000,000 acres national forest land; that includes waste land as well as timber land; and in the State of Washington approximately 9,000,000. That is 5,000,000 acres less national forests in Federal ownership in Washington than in Oregon. The area of the State of Oregon that is in Federal ownership, I believe, including all forms of Federal ownership, which includes a very large acreage of desert land area (2393) and public domain in the southeastern portion of the State is approximately half of the area of the State. It is not far from fifty per cent and that percentage is not nearly so large in Washington.

On the Anderson-Middleton sale in Lane County, the net result is this: A block of 2,020,000,000 feet is put out. One sub-block of that major block is sold and at 375,000,000 it would amount to about 15 per cent of the whole. That will keep them cutting for between nine and ten years. In the meantime 85 per cent of
1290 that block is set aside or tied up.

Q. That is, for between nine and ten years; then for nineteen years 70 per cent of it is set aside and tied up?

A. No. That is assuming that a similar size block will be sold the next time.

Q. Yes; well, isn't that your plan? (2394.)

A. Well, the size of those fluctuate somewhat, depending upon the particular topographic situation. We try to sell them in natural logging units within the block. The next sale might be somewhat less or somewhat more. But it will take 97 years before we get rid of all of it. So that the flow of timber onto the market and for transportation by the railroads from the national forests is going to be a steady one. In other words, it will not be thrown on all of a sudden so that it will require a great deal of additional transportation facilities to handle it. Our purpose is to keep the cut steady, sustained from year to year.

Exam. ROGERS. Do you know what the annual cut has been as a total over any given period in the past? Well, the State as a whole or for cuts in such way as you have it? What I am trying to get at is

as to whether there is prospect that any more timber in the total will be cut in the future than there has been in the past few years? (2395.)

A. Yes, there will; through the sale of additional blocks. That will go forward. I am dealing just with the national forests. The private lands, a lot of them, were cut out and they are being cut out while we are placing these others on the market; particularly in the Columbia River Basin in Oregon.

I believe that the statistics show that the total consumption of softwood in the United States has been pretty much on a level—about the same; which means that the per capita consumption has been dropping somewhat. The total consumption has been remaining about the same over the last several years.

1291 Q. Now, of course, the same principle obtains over the Grant and Harney Counties, where you have the five and a half billion block of pine? There you sold 770,000,000 which will give them cutting material for thirteen years; then another block will be put on; the major portion will be tied up for another twenty or thirty years, won't it?

A. It will be tied up for the period of this first sale of (2396) thirteen years. That is within this area. There are also some additional blocks which have not been considered.

There is one large body of privately owned timber within the Malheur National Forest. That is that owned by the East Oregon Land Company. They have somewhere in the neighborhood of 600,000,000 feet of western yellow pine. Elsewhere within the forest it is small.

Q. Well, that block is not tributary to this railroad that has been constructed from Burns up to Seneca but is separated from it by a divide which will necessitate its moving, when it does move, down the north fork of the Malheur to Juntura; isn't that right?

A. I believe logging engineers have differed somewhat in their opinions. Some contend that the Juntura outlet will be the logical outlet and others have contended that it can be moved out over the Seneca-Burns Railroad as readily, or more so, than the other. I would not say which is correct. (2397.)

This five billion feet north of Burns that is tributary to the so-called Burns-Seneca line, is east from Emigrant Creek, and extends to that John Day River divide. That block so tributary comprises the five billion and whatever amount it was; and within that territory there is comparatively little private timber; probably not more than three or four hundred million feet; there might be as much as 400,000,000.

West of the Malheur National Forest is the Ochoco Forest. As to its being a continuous forest, or somewhat divided: It has

1292 that deep canyon of the south fork of the John Day River that cuts back into it; so that part of it would naturally go down Silver Creek to the Burns country; and the other part would go toward Prineville for the logging and manufacturing. (2398.)

The Lake County forest, national forest, is in my control, too. That is called the Fremont National Forest, lying in Lake County.

Q. How large a tract is there in the Fremont Forest, in the north end of the county, or, rather, in the north end of the forest right south of Silver Lake; do you remember, about?

A. Well, comparatively the great big bulk of the timber is in the south end of that forest. It is not in the north end. That is for two reasons: We run into more of the unmerchantable jackpine or lodgepole pine; and the—where that timber is better there is more of it in private ownership farther north.

Q. I wish you would look at this key map, so-called Exhibit 3. Does the Fremont Forest, I believe you call it, or the Fremont National Forest, appear on that map?

A. Yes, sir; this is the territory [indicating on map]. The territory in the vicinity of Paisley and Lakeview, and it extends north to the Silver Lake. When the timber is moved or disposed of, this in the north end, if it were disposed of at the present (2399) time, would be most apt to go to the Klamath milling center, although you get into a territory a little farther north of that we feel would probably be somewhat disputed as between Bend and Klamath Falls. That is, north and west from Silver Lake. There are only some very small scattered tracts there in the Fremont Forest. There is some, these patches out in here [indicating].

Q. Now, how much of a stand is there in the north end of the Fremont Forest between Silver Lake, say, and the words "Summer Lake" on this map? There is a district in there of about
1293 how much, do you remember?

A. As I recall the figures, the total stand on the Fremont National Forest is about 7,000,000,000 feet, and there is probably not over one billion of that in that north-end territory.

Q. That is, alongside of the Summer Lake and to the west of it and running up to Silver Lake?

A. That is of the national forest timber. Our heaviest stands in that territory are farther south.

As to whether I consider any of that would be milled on Silver Lake (2400): There is a considerable territory around Silver Lake, which, if there were transportation out from Silver Lake, could very readily be milled there, but it is not big stands in the same comparison with those stands further south. The quality of the timber is as good as that being manufactured at Bend, but it is not as good as that being manufactured at Klamath Falls. It is probably not quite as good as that that has been contracted for by Hines.

Q. Now, you were speaking about the vacant area in Oregon as compared with Washington, as I understood you. Was that what you had in mind?

A. Well, I didn't make any direct comparison, but I said that of the total a large proportion of the Federal ownership in Oregon was made up of vacant public lands. It is open to entry in this

so-called high desert country in the southeastern part of the State. As I understand, comparatively little of that is being entered upon now. A good deal of it was taken up a number of years ago under the grazing homestead act. They took up around the water bowls and key positions, patches of ground, areas of ground (2401) which would control the surrounding country. They were taken up for grazing purposes almost entirely. There is a good share of the country that I would say would not afford opportunity for
1294 settlement. I think that is the reason there is such a large acreage that is public domain, when it can be taken up under the public land laws if anyone wants it.

This operation over there in the Malheur National Forest has been in a development stage for about five years. Our first contract was made in 1923 with Fred Herrick. That involved the same identical forest area that is involved in the sale I have recently made to the Hines people. The contract with Herrick was canceled because of nonfulfilment of its terms.

Q. Has there been a tree cut, or anything milled or produced pursuant to the contract of 1923 that was entered into for the harvesting of this timber?

A. Nothing except in connection with the construction of the railroad, a small amount of stuff along the railroad right of (2402) way.

The Hines people have two years within which to commence operation and production. They must begin cutting, under the terms of their contract, by August 1, 1930; and their maximum cut under their present contract is to be 60,000,000 feet a year.

Q. Well, can they, or anyone else, obtain the contract to sustain additional or supplemental operation there?

A. You may recall the figures show that the permissible cut from that territory is 73,000,000. We have only sold 60,000,000; that is, the basis of the cut is 60,000,000 a year. There is a surplus there of 13,000,000 but our present plan is to hold that as a surplus until we see how things are cutting out on this first sale unit and check our estimates a little further.

The headquarters for this operation around which it circles will be at Seneca, and that is in what is called the Bear Valley.

Q. And the Bear Valley is a basinlike up there, well up on the mountain, or on the side of the mountain?

A. Well, it is a high, open—it is rather a table land.
1295 (2403.) Rather than a mountainside, it is comparatively flat.

Off to the east of Seneca there is additional timber owned in national forest ownership; accessible to Seneca by what is called the Bear Creek route. I think that is less than ten miles from Seneca into the timber. We haven't any restriction on that as yet; that is in this five and a half million, or rather billion. That could not be sold.

There has been no hard and fast rule applied, of which I am aware with respect to the cutting of timber in the same county in which it stands. But we have endeavored in every case with (2404)

which I am familiar to protect the local communities in so far as that can be done to a reasonable extent; and we have done that somewhat along the lines of county boundaries, inasmuch as the county is the local governing unit, and we have in a number of instances required that timber cut from a certain area within a given county shall be milled within that county. That would not necessarily follow in every instance.

It is a fact that the operation there in this Malheur Forest the milling operation, the manufacture of the lumber is to be carried on at Burns and it is so stipulated in the contract; at or near Burns. And in that instance a portion of that timber comes from a different county.

Q. (By Mr. DEY.) In any instance, Mr. Ramsdell, where the economies of the situation and the natural milling location require manufacture outside of the county, the economic law would be followed, wouldn't it?

A. Yes; I think that that in general would govern.

In giving the acreage in the national forests of Oregon at 13,000,000, with 9,000,000 such (2405) acres in Washington, I did not include in that 13,000,000 in Oregon the Oregon & California Railroad land grant, the title to which has been in the Federal Government since 1913.

1296 I did not include the lands in the Indian reservations. When you add to the national forests over which I have jurisdiction the large O. & C. grant, and the timberlands on the Indian reservations, I don't know what proportion of the timber in Oregon is in Federal ownership, but it is considerably, a good deal less than half of the timber is in Federal ownership; the reason for that being on an acreage basis it might, for instance, be half or over half, but on the volume basis the best stands and the heaviest stands are in private ownership.

Q. Now what is the increase in production that you expect, or increase in marketing from the timberlands of the national forests that you expect in the future as compared with the past? That is, in thousands of feet?

A. I could have readily brought along that figure and have given it to you on an accurate basis, but our increase is going to be very material in Oregon—several times over the (2406) present. We are cutting now I believe somewhere in the neighborhood of 250,000,000 feet a year only of national forest timber in Oregon—not a very great cut, compared to the total cut. Our total cut, for instance we figured it up last year and it was less than five per cent of the total cut of timber in Oregon that came from the national forests. Which would indicate that the timber on the private lands is being cut at a very much greater rate than on the Government lands. Our cut will increase very materially as the private timber is cut out. Our cutting will have to increase very materially, in order to sustain the present production of lumber from this State.

Exam. ROGERS. Do you expect any total increase from the State, from both Federal and private ownership?

A. Well, that is pretty difficult to forecast. I imagine that there will be an increase.

Exam. ROGERS. What leads you to that conclusion?

1297 A. Principally because of the situation in the adjoining State of Washington, where so many companies and mills are cutting out, completing their cut, shifting the cut into Oregon. (2407.) It is for that reason that the Forest Service has made no effort whatever to increase its cut. We believe it would be poor policy to make an effort to increase our cut at the present time. The fact is that the lumber industry in Oregon has been in a pretty bad condition for several years and in Washington too. The market has been glutted and the prices have been very low. Many mills on the verge of bankruptcy; that is common knowledge; and a great many closed down; they are closing down for longer periods, apparently than they have for a number of years.

Redirect examination:

Q. (By Mr. ELLIS.) Mr. Ramsdell, you stated that you expect, or I understood you to state that you expect the cut from national forest timber in Oregon to increase as other timber stands are cut out, and you referred particularly to the (2408) Washington timber. Are there other timber stands in the country which would affect the cut in Oregon in a similar way?

A. Yes; the condition in the so-called southern pine belt. The cut in that region is decreasing from year to year. It has not decreased as rapidly as a great many people, both Federal and private officers, or Federal officers and private timberland owners and loggers expected—not as rapidly as they have predicted; the reason for that being the great increase in the cut of the small mill in the South, picking up the small patches of timber here and there, by the little fellows, which has held up the cut. But the situation at present, as near as we have it, is that that is pretty well—that that cut is now dwindling, and the statistics show that the cut in the South is on a decline. Now the decline has not been—oh, it

1298 has been very appreciable, but it has not been by any large percentage. I imagine that possibly a ten per cent decrease in the cut occurred last year.

Exam. ROGERS. How long do you think it would take that decrease in the southern pine tonnage to make up for the overproduction which you say exists in the timber cut in this country? (2409.)

A. Well, that is a problem that is baffling the entire industry out here.

Exam. ROGERS. That would be the crux of the thing, wouldn't it, Mr. Ramsdell?

A. Well, not entirely. The South is a rapid timber-growing section. They are always going to grow and going to cut lots of timber. They will always have a big cut in the South, but they will decrease materially from the present cut.

Exam. ROGERS. I thought you were saying that due to the timber down in the South gradually diminishing, the cut out here in this country would increase?

Answer. That would follow naturally. It is bound to follow.

Exam. ROGERS. Yes; now if there is an overproduction in this country, wouldn't you have to set that up against the decrease in the southern tonnage to see how long it would be before you would have any increased production in this country?

A. Unfortunately those factors alone don't determine it. For instance, it would be entirely possible to have an overproduction in this territory, even though there were no cutting at all in the South. Overproduction is not confined to the Northwest; it is a national condition; it is not a regional condition. (2410.)

Exam. ROGERS. What other section do you have in mind than the Northwest?

A. The South principally. California is an important factor. I do not know the estimated amount of standing timber in the southern timber belt and the annual cut at the present time. I could not quote those. The information, to the best of our knowledge, to
1299 indicate how soon the South will cease to be an exporting section for lumber, the South will indefinitely be an exporting section in lumber. You understand, up to the present time they have done not only an exporting but a very heavy exporting. The degree of their exporting will change. The quality of their lumber product has decreased to some extent during recent years. I believe that has been a factor in the marketing of the Pacific coast lumber; enabling Douglas fir in particular to invade the eastern markets.

In comparing the production or cut of national forest timber in the State of Washington with that in the State of Oregon; Washington cuts more timber than any State in the Union, and Oregon is second. (2411.) I have in mind the percentage of cut of timber from national forest timber in Washington at the present time for the last year. I stated previously that in Oregon the cut from the national forests made up about five per cent, a little less than five per cent. In Washington it is a little less than three per cent. The cut in Washington bears approximately the same relation to that in Oregon from national forest timber; that is, they are not far apart. They fluctuate somewhat, but we have been cutting just about the same amount in the two States. The difference in percentage is because they are cutting more private timber in Washington than in Oregon. I have not given the total cut of all timber in Washington and Oregon. We have all of that information, of course, on file in our office. As I recall it, the cut in Washington, the last year figures which have been issued by the Census Bureau, about 6,000,000,000 feet; something like four and a fraction billion feet in Oregon. Those figures, however, can be readily verified. They are of record.

Exam. ROGERS. As I get your testimony, the mere presence of standing timber does not mean that it is going to be cut within the near future; is that right? (2414.)

1300 A. Well, applying that to national forest timber, or to private timber, or to both?

Exam. ROGERS. Would there be a difference?

A. Yes; there is. Private timber is, on the whole, going on the market more rapidly and being cut more rapidly than the national forest timber, and will be.

Exam. ROGERS. Does the presence of private timber mean that it is going to be cut within the near future, say within the next ten years?

A. No; it does not necessarily follow at all, there are so many different factors which will determine that.

Exam. ROGERS. And what would the situation be on the Government timber?

A. The same would hold true, except our timber, under all circumstances, will go on to the market more slowly than the private timber.

As to whether I have in mind the total timber stand in the State of Washington; no, I do not.

Q. Do you know whether the figures of total timber or lumber cut in Oregon and Washington which you have given approximately, represent about the ratios between the cuts in the two States over the past few years?

A. Well, those figures I gave were for the last year. I believe that Oregon has been in second place for about three (2413) years now, and previous to that Louisiana was in second place, showing the decrease in the cut in the South and the increase in the cut in the Northwest. But, in general, the cut in Oregon has been increasing more rapidly than any changes that have been taking place in Washington.

Q. Now do you have in mind any estimates of stumpage value of Government timber in the Columbia River area as compared with stumpage value of the same kind of timber down in Douglas County?

1301 A. There is no national forest timber in the Columbia River territory below Portland. I don't know the value of private timber enough to quote it. I know in a general way that it is naturally considerably higher than it is in Douglas territory. I would hesitate to express that approximately in dollars per thousand, because of the fact that we have no direct dealing at all with the timber in this Columbia River territory below Portland.

I presume the accessibility to water transportation is the principal factor why there is a substantially higher price in the Columbia River area than in Douglas County or other southern Oregon points. (2414.)

In my opinion the factors that have contributed to the more rapid cutting of the Washington coast timber belt as against the Oregon

coast timber belt (2415) west of the Cascades, from the summit of the Cascade Range to the coast, I would imagine it would be principally a matter of transportation; affected by the harbors and the ocean transportation. Of course, Puget Sound has a very great bearing on the Washington situation and there is considerable shipment at Grays Harbor. There is considerable moved out of Willapa Harbor over here on the Washington coast.

Comr. McMANAMY. Will you give an expression of your views now with respect to the entire State? Along the same lines of Mr. Dey's questions. You confined your answer to west of the Cascades. How would you change it, or would you change it, as it applies to the entire State?

A. That is, as between the two States?

Comr. McMANAMY. Yes; the same question applied to the entire State. (2416.)

A. Well, I think it is true that up until the more recent railroad development in eastern Oregon that eastern Washington has had better transportation facilities, railroad transportation, and on that account such timber as they had has been going out more
1302 rapidly. Of course, eastern Washington doesn't have near as good or near as large a quantity of timber as eastern Oregon has.

Exam. ROGERS. What becomes of the land when they cut off timber out there? Down south much of it when they cut it off, why, the stumps are cleared out and they farm it. Is that true out here?

A. Well, that varies with the land and the ownership. The national forest land lies almost entirely in a rough and rugged country at comparatively high elevations, where agricultural use is practically out of the question. In the privately-owned timberlands, a small proportion of cut-over land is yearly going into agricultural use. It is quite a small per cent.

Comr. McMANAMY. Well, is it not the policy to maintain the national forest lands as forest lands permanently?

A. Yes, sir.

I don't know as to the percentage of the timberlands of Washington in the beginning that were in private ownership. (2417.) Most of this timber that has been cut over in Washington has been cut from private timberlands, where the cutting is always much more rapid than on timber in the national forests.

Mr. SPENCER. Well, Mr. Ramsdell, if I might ask, the commissioner asked you for a comparison as to the whole State, and you referred to the greater railroad service enjoyed in eastern Washington, as I understood you, better transportation service and more of it. Now, does eastern Washington have as much pine timber as eastern Oregon?

A. No; it doesn't, because, as I mentioned, there is nowhere near the amount of timber there to cut. They don't have the opportunity for cutting. (2418.)

J. S. MAGLADRY was thereupon produced as a witness on behalf of complainants, and, having first been duty sworn, testified as follows:

1303 Direct examination:

My name is J. S. Magladry; I live at Eugene and am engaged in the manufacture of lumber. I have been engaged in the manufacture of lumber in the Willamette Valley, in Lane County, approximately 28 years. As to the extent of my own operation, I cut about twelve to thirteen million a year. I ship out about 25,000 to a carload. You can estimate that on the basis of 25,000 to a carload. I haven't got those figures; it would be about 520 cars a year.

I am familiar generally with lumbering operations in the fir district in the entire Willamette Valley; and have been over a considerable period of years. (2419.)

The name of my company is Bohemia Lumber Company and the mill is located south of Cottage Grove about three miles in Lane County. My company is a member of the Willamette Valley Lumbermen's Association. The Willamette Valley Lumbermen's Association at the present time have 32 members, representing a cut of about 120 carloads a day, or 36,000 carloads a year. The mills of the members of the Willamette Valley Lumbermen's Association, generally speaking, are located from Salem south to Cottage Grove, at different points in the Willamette Valley. They are all manufacturing, generally speaking, the same kind of lumber products.

The mills of the Willamette Valley Lumbermen's (2420) Association membership in the valley association is confined exclusively to rail shippers. About 70 per cent of the products of the mills of the Williamette Valley Lumbermen's Association goes east, into the Middle West and East. That would be 70 to 75 cars a day.

I, myself, am president of the Willamette Valley Lumbermen's Association. Briefly, the purpose of the Willamette Valley Lumbermen's Association is to mutually assist the membership in
1304 marketing conditions, and discuss operating methods, and all that sort of thing.

I should say the members of the Willamette Valley Lumbermen's Association are interested in transportation problems. That is a large question. (2421.) The Willamette Valley Lumbermen's Association does not include in its membership all of the manufacturers of lumber within the territorial limits of the Willamette Valley.

I can give you, in just a moment, how many mills, about, there are in the entire territory and about what the production of the entire lot, including the 32 members of my own association is. Well, in the Willamette Valley territory, comprising the counties of Benton, Clackamas, Douglas, Jackson, Josephine, Lane, Linn, Marion, Polk, Washington, and Yamhill, including the members who are exclusive rail shippers with mills located on or tributary to the

lines of the Southern Pacific, and who produce approximately 325 carloads of lumber daily, or approximately 96,500 carloads annually, and distribute for labor approximately $80,000.00 a day, or $24,000,000.00 annually. That is all of the mills in those counties of the Willamette Valley, including the Willamette Valley Association. Corresponding figures for the amounts expended for labor by the mills of the Willamette Valley Association; I have it here. About $30,000.00 a day, or $9,000,000.00 a year, for labor.

I said, that 70 per cent, approximately (2422) of the rail shipments of lumber out of the Willamette Valley went to the East and to the Middle West. The remaining 30 per cent principally goes to California.

The principal change in the marketing of lumber that has taken place within recent years, as it has come under my observation and that of other manufacturers in the Willamette Valley, is the
1305 demand for quicker deliveries. The retail yards don't carry the stocks that they used to a few years ago, and where we used to accept orders for delivery in 60 or 90 days, it is a very common thing now for them to place delivery in 30 days. It is quicker delivery. At the present time the quickness of delivery of lumber is a very important factor in its marketing.

I do not know of any section of the United States producing in large quantities that is more remote from the largest consuming markets in the eastern and central and middle western sections of the United States than the Willamette Valley. (2423.)

The Willamette Valley lumber mills in selling their lumber are in competition with lumber mills in other producing territories in the United States. As to where some of the other principal producing territories in the United States are with which the Willamette Valley mills are in competition; well competing with the southern and eastern pine. We are competing also with manufacturers of pine lumber in California, Oregon, Washington, Idaho, and Montana, in eastern markets.

Q. What would you say the character of that competition is between the various lumber producing sections of the United States in the sale of lumber in eastern and central and middle western markets in this country? The character of the competition? Is it anything you have to pay any particular attention to or not?

A. Well, competition always affects price, and where they have advantages over us on freight rates, why, in order to make a sale we naturally have to drop the price to meet that competition. (2424.)

The mills of the Willamette Valley, generally speaking, cannot fix any price they may choose to ask and get it in selling lumber in eastern markets. In certain grades of lumber the competition in selling Willamette Valley lumber in eastern markets is keen; that is, the competition we encounter in selling with other producing sections. In structural timbers, no, but in house-building
1306 lumber, or what we call the yard stocks, why, the competition is keen. Structural lumber, no.

Q. Now, you said that often you would get an order nowadays for delivery in 30 days, where before it was common to specify delivery in 60 or 90 days. Orders nowadays, as contrasted with those in former years, are they in the same volume as they used to be? That is, will the orders be for as many cars at a time as they used to be?

A. No; the orders are smaller orders. The orders are smaller. They are ordering in less quantity at a time and demanding for their delivery; that is why they are demanding quicker delivery, because they are ordering in less quantity at a time.

Exam. ROGERS. Where did you say shippers were located that had the hundred or more cars a day, did I understand, members of your association? (2425.)

A. I don't get that.

Exam. ROGERS. Where are the members of the Willamette Valley Lumbermen's Association located?

A. The members of the Willamette Valley Association are principally located in the valley south of Salem, between Salem and Cottage Grove—that is, Marion County on the north and Lane County on the south.

Exam. ROGERS. Well, for those shippers the matter of shorter mileage, the cross-State line as proposed would be about the shortest mileage to the East, wouldn't it?

A. Yes, sir.

Exam. ROGERS. And I believe you said 70 or 75 cars a day goes to the Middle West and to the East?

A. From the association?

Exam. ROGERS. Yes.

A. Yes.

Exam. ROGERS. That is, from this territory located between Salem and Cottage Grove?

1307 A. Yes, sir.

Exam. ROGERS. In the valley?

A. Yes, sir.

Exam. ROGERS. Now, you say that time is an important element?

A. Yes, sir.

Exam. ROGERS. That being true, how much of these 70 or 75 cars a day going to the Middle West and East can be depended (2426) on to be routed over the cross-State line, if it is built, by the shippers?

A. Why, it would seem to me that it would all go that way, because the particular purpose of the valley lumbermen in favoring the cross-State line is to make quicker delivery through the shortening of the distance, and good business would dictate that they would send it all that way, otherwise they wouldn't get the benefit of shortening of the distance and the quicker delivery, as I understand it.

Exam. ROGERS. Do you feel, then, with reasonable certainty that these 70 or 75 cars a day can be depended on?

A. Why, I feel that every carload going East would—should go that way. Any shipper to get advantage of what we are trying

to get, to make quicker delivery, would naturally route his stuff that way, in order to get it there quicker.

Exam. ROGERS. Do you now ship about 520 cars a year from your own mill?

A. Well, whatever that figured; put it down as five hundred.

Exam. ROGERS. That would be something like two cars per working day. And where does it go? To the Middle West and East? (2427.)

A. Yes; to the Middle West and East. That is, not all of it. Out of our—my own plant ships probably 50 per cent of its cut to California. I would have about one car a day, then, going to the Middle West and East.

1308 Exam. ROGERS. Well, can you say what would happen to that one car, as to the routing, whether it would go over the cross-State line or not?

A. Oh, absolutely it would go over the cross-State line, sure.

1309 PORTLAND, OREGON, *August 16, 1928.*

J. S. MAGLADRY thereupon resumed the stand and further testified as follows:

Direct examination—Continued.

Neither our association, nor my concern employ a traffic manager. The purchaser of lumber ordinarily pays the freight charges and deducts it from the invoice. The shipper actually pays it, but the purchaser pays the expense bill on the receipt of the car and deducts the amount from the invoice. (2429.)

Sometimes the purchaser specifies the routing; speaking generally the purchaser names the route.

Comr. MCMANAMY. Does that go to the extent of naming the full routing, or only the line from which he will take delivery?

A. Well, they generally name—a large part of the sales are made through wholesalers, and the wholesalers generally specify the routing in the order. The shipper does not necessarily follow those instructions so long as he lands the material on the line of delivery to the purchaser.

Exam. ROGERS. Can you tell us how the lumber shipments are routed at the present time from this territory from Salem down to Cottage Grove?

A. How they are routed East?

Exam. ROGERS. Yes, sir.

A. Oh, they are generally routed from down there by Roseville Junction over the Southern Pacific.

Exam. ROGERS. What percentage of them would you say are routed Southern Pacific through Roseville?

1310 A. Well, from the Willamette Valley they practically all go there. (2430.)

Exam. ROGERS. And that would mean that comparatively few go through Portland?

A. Yes, sir.

Exam. ROGERS. Well, if time is the important factor, why don't they route it through Portland instead of Roseville?

A. I don't know as I can answer that. I didn't know that there was much difference between the routings by Portland and Roseville in time.

Exam. ROGERS. Do you know what the difference is in time between, say, Cottage Grove and a given point east by the Southern Pacific road or route as compared to the Portland route?

A. No; I do not know the difference.

This proceeding for the construction of the cross-State line has been the subject of very much discussion among the members of the Willamette Valley Lumbermen's Association, and the question of routing of their traffic over it, if built, has also been the subject of discussion among the members. The reason they favored the line was because of the shortening of the time and of the distance. (2431.)

Inasmuch as the shortening of delivery time is the vital question, I would say that practically all of the shipments of other members of the Willamette Valley Lumbermen's Association to eastern points, as well as those of my own company, would be routed over this cross-State line, if it were built.

Exam. ROGERS. Mr. Magladry, does there seem to be anything illogical about that in your mind, to say that all shipments would be routed via the cross-State line, if they are now using the longest route that is available as compared with a much shorter route?

1311 A. Well, I don't know. It seemed to be the general impression that there would be a saving in time by the cross-State line of at least three days.

Exam. ROGERS. How much?

A. Three days.

Exam. ROGERS. To where?

A. Chicago.

That would apply to any point east of Granger, Wyoming, as well as to Chicago. (2432.)

That would mean that the three-day saving would have to occur between the point of origin and Granger.

The character of business done by the Williamette Valley fir mills is what is generally called retail yard stock, house-building material. This is stock we already have on hand and can be loaded right into the car. Special orders for special construction have to be specially cut and specially prepared. (2433.)

25 or 30 per cent of the business of our mills is special-order business. That means that we have to cut and prepare the lumber before it can be loaded; certain grades of lumber out of certain quality and certain lengths of logs. It takes time to do that.

We made a check-up on yesterday and found that the average number of days required for lumber to move from Eugene to Chicago on recent shipments, was 16; the shortest time 14 days, and the longest was 18 days.

The Willamette Valley Lumbermen's Association intervened in support of the complaint in this case for numerous reasons. In the first place it was their thought that railroad development makes for the general (2434) development of the State. General development means more business. Competition in transportation gives us better service. The shortening of time into Chicago
1312 is another case of better service, which means more business, and then, particularly, we have a disadvantage in getting into Idaho points, where we feel we would be entitled to a revision of rates that would increase our business materially. The rate on fir lumber from Portland to Boise is 39½ cents; from Eugene to Boise 44½ cents, a difference of 5 cents. On 2,500-pound lumber, the weight of average fir lumber, and at 25,000 feet to the carload, there would be a difference of $31 a carload on lumber to Boise. That difference shuts us out of Boise and surrounding territories entirely. (2435.)

At an eastern point in Southern Idaho, Pocatello, for instance, there is a difference of 2½ cents in favor of Portland as against the Willamette Valley, which represents just half the difference on the carload, or $15.00 or $16.00. It puts us out of business in competition with Portland mills. At the present time Willamette Valley lumber shipped to Southern Idaho would have to come through Portland then go East over the O.-W. R. & N. and Oregon Short Line. Eugene is 125 miles south of Portland and Cottage Grove 22 miles further south. 2436.) Eugene is fairly representative of the center of lumber production in the Willamette Valley south of Portland. If we had an even break with Portland in the Southern Idaho territory it would increase our volume of business very materially and the construction of this cross-State line would give us an even break, so far as distance is concerned.

Comr. McMANAMY. Do you know whether or not the same condition applies to lumber manufacturers in San Francisco? That is, how is the rate from Eugene as compared to the rate from California points?

A. I could not answer that question. There is no lumber manufactured in San Francisco. (2347.)

1313 In billing lumber to eastern destinations we insert in the bill of lading the routing to be followed by the shipment. That is the practice of the Willamette Valley mills generally. All lumber shipped by rail from the Williamette Valley is sold delivered at destination. That is the universal practice.

As to the importance to Willamette Valley mills of a competitive rail route, or a new rail route east, that they could use in addition to the ones that they have at the present time, it has been our experience that all railroad development means general development of the country, and that always means more business. On the Coos Bay line it has increased our lumber sales so that we are shipping lumber now right down into a lumber country, and we are shipping

fir lumber into Klamath Falls right now for purposes where the fir is more suitable than the pine.

The lumber industry of the Willamette Valley in the past has encountered (2438) more than one very serious car shortage, which has had the effect of shutting off business and a loss of orders. (2439.) It is the thought of members of the Willamette Valley Lumbermen's Association that the building of this cross-State line and the shortening of distance and time in shipping to eastern points of destination would have the effect of an insurance against the recurrence of car shortages they have experienced in the past. If we are going to lessen the time of delivery east three days, there would be the same lessening of time in the return of that car. But with the cross-State line a car would go east and come back again in six days less time than at the present time, other things being equal.

Exam. ROGERS. Do you expect to get the same cars back that you send east?

A. Not necessarily. Not necessarily the same cars, but some cars have got to come back.

1314 Exam. ROGERS. Well, how do the members of your association think that this protection against car shortage can be brought about other than this shortening of time bringing in the empty cars?

A. Answering Mr. McCulloch's question, which was what I was trying to do, it will take a car six days less time to make a round trip. That answers the question.

Exam. ROGERS. That was the only reason you had?

A. No. That is the way I would answer his question, as to the effect it would have as a protection against car shortages. (2440.)

Exam. ROGERS. Yes; but you said that the members of your association had given consideration to the probable elimination of car shortage due to the construction of this proposed line?

A. Yes, sir.

Exam. ROGERS. Now I ask you how the members of your association thought that elimination would be brought about.

A. By a car making a round trip in six days less time.

Exam. ROGERS. Any other reason?

A. No; not as a protection against car shortage.

It is my thought, and the thought of the members of my association, that the release of a car for the loaded movement east and the empty movement west six days sooner than if it went via the Roseville route, would be the equivalent of so many additional cars added to our supply.

The members of the Willamette Valley Lumbermen's Association look on the construction of this line from Crane to Crescent Lake as a convenience and necessity in the interest of the public.

Exam. ROGERS. When did you have your last car shortage, Mr. Magladry?

A. Well, we have experienced no car shortage for the past three or four years. (2441.)

1315 Cross-examination:

In a general way I would say that wholesalers, as a rule, purchase and dispose of the lumber product of the mills of our association; there are a large number of wholesalers or lumber brokers engaged in that business practically exclusively. As to Eugene and Portland, I would like to qualify my answer there a little. The larger operators maintain sales agencies themselves in the various eastern points, and in that case the wholesaler has nothing to do with specifying the route. The smaller operators who do not maintain sales agencies make their sales through the wholesalers, and the wholesalers name the routing. The mill doesn't necessarily following the routing specified by the wholesaler, only make sure to get it on the delivery line, or on the line that goes to the purchaser. Speaking generally, they do follow the routing specified. We do not have any particular broker who handles our lumber. (2442.) We deal with several different ones.

A large percentage, a very considerable percentage, of the output of our Willamette Valley mills is purchased by different railroad companies. As to whether we make our purchases to brokers, I qualify that question. Down in the valley our sales are made almost exclusively to the Southern Pacific, so far as the railroads are concerned. We are not available to the others. We participated in the recent large purchase by the Pacific Fruit Express Company; I understand the Southern Pacific Company and the Union Pacific are joint owners in that enterprise. The sales there and distribution to the various mills were not necessarily worked through brokers. It isn't the policy of the railroads to work through purchasers; the sales are made and orders are placed through their purchasing department. (2443.) As to whether the purchase of

1316 that particular order was made through four brokers—there was a combination of mills that got together and handled that business; it was not handled through brokers that I know of. We had contact with some of the other mills; they divided up their business with us, and we didn't have contact with any broker at all. I couldn't answer the question now as to where our routing instructions came from. I am not taking an active part in my mill, and I don't know just what the instructions were or where they came from; I imagine they would come from the purchasing department of the Pacific Fruit Express, the natural place. The brokers, or the wholesalers, are the big purchasers from the smaller operators.

By the Willamette Valley, that is the southern part of it, I mean the western Oregon mills. (2445.) Cottage Grove is in the Willamette Valley; it is the head of the valley. The mills in the valley having their own sales agency in the eastern markets are the Booth-

Kelley Lumber Company, the Silver Falls, at Silverton, the Hammond Lumber Company, and the Spaulding, all of which are members of the valley association. These four mills represent a large part of the valley association. There are thirty-two mills in our association. As I testified yesterday, there are about three hundred mills in western Oregon, three hundred and twenty-five I think. (2445.) The brokers or wholesalers who purchase from those three hundred mills, excluding the four that I mention, sell their product to a considerable extent while it is moving to the destination; there is some diversion enroute as they accomplish their sales, but not much. A small part of the shipments are diverted. Take it at such times as 1920, when the lumber business was at its peak and these fellows were speculating in lumber and speculating in the price of lumber, there was quite a little bit of diversion, but when conditions are as they are now and have been for the past few years there is very little of that done. The stuff is bought after it has been actually sold and there is no necessity or occasion for diversion.

1317 It is the desire of the members of my association to save some three days time to eastern markets in moving our lumber; the association has discussed that feature and expressed its desire to bring that about. (2446.) The Portland or Tillamook mills are not members of this association; the membership in the valley is confined exclusively to rail shippers.

Q. Well, do you include shippers in Yamhill County?

A. Yes, sir.

Q. In Washington County?

A. I don't know as the association does in Yamhill.

Q. Well, Spaulding is in Yamhill.

A. Yes; that is so.

In the discussions I did not hear any comment about the time consumed via the Portland route as compared with the Roseville-Ogden route, but yesterday they did ascertain the average time to these 16 days to Chicago. They checked up from expense bills just as they took them off the file to ascertain the time if they went via Portland and Granger. (2447.)

Q. That is, via Ogden?

A. Both ways. I am assuming that it is both ways.

Q. Well, now, do you know whether it is both ways?

A. I do not. I wired for this information last night to the Booth-Kelly Lumber Company, and they took their expense bills, their recent expense bills, as they came to them, of cars shipped to Chicago and checked them off.

I imagine Booth-Kelly ships altogether via Ogden, but I don't know.

Exam. ROGERS. Where are they located?

A. Eugene. The mills are in Wendling and Springfield. The head offices are at Eugene.

The mills are just out of Eugene, on the branch line of the
1318 Southern Pacific; the Springfield mill reaches the Cascade line of the Southern Pacific at Springfield. I don't know whether the regular schedule via the Union Pacific system lines from Portland to Chicago on lumber is 9 days or not. (2448.) We move our lumber in one day to Portland. It takes us 16 days on an average to go via the Roseville route, according to information that was ascertained through checking a number of expense bills yesterday. I don't know why, with that great disparity in time, if time is the factor, none of this lumber moves to speak of via Portland. It would seem that there must be some reason, if it doesn't move via Portland, and there is a difference of five or six days from Eugene to Chicago via Portland as compared with the Roseville-Ogden route, for shipping it via the Roseville-Ogden route, but I don't know what that reason is. (2449.) I did not say yesterday that our association mills would ship 200 cars a day east via the cross-State line; I meant all the western Oregon cars.

Q. Would that include Tillamook and Portland?

A. No; we don't include Portland in any of our estimates.

Q. Well, you wouldn't include Tillamook, either, would you, if it comes down through Portland?

A. I think Tillamook is in this. I have got a complete statement of all the mills in the Willamette Valley and their capacity and conditions of operation, and all of that, recapped in here; I would have to refer to it to answer your question.

Exam. ROGERS. I noticed that 200 cars in the papers.

A. I noticed it in the Oregonian this morning.

Exam. ROGERS. I didn't recall the——

A. I stated these——

Exam. ROGERS. Wait a minute. Of course, the record will show, but I didn't recall the figure 200 being used at all. I have it 'a hundred cars a day in this territory from Salem down to Cot-
1319 tage Grove, about 70 per cent, or 70 to 75 cars of that 100 cars went to the Middle West and the East.

A. In other words, I think I said that 70 per cent of the shipments of the Willamette Valley went east, and that was reduced to carload lots—— (2450.)

Mr. ELLIS. What was this hundred cars a day? Was that your association mills, or all mills in that territory?

A. I said that the Willamette Valley Association represented a cutting capacity of 120 carloads a day, that 70 per cent of it went to the Middle West and East.

That is the capacity of our association's mills; the capacity of the total three hundred mills is about eight million feet a day.

Q. It has never been reached, even in the peak of 1920, has it?

A. How is that?

Q. They never have operated to capacity, even in 1920?

A. The figures I am using was information that was assembled on the 16th day of June of this year.

Q. Well——

A. We show what mills are operating, those that are down temporarily, and those that are down permanently. I have got the whole record here.

Q. Well, I would ask this question, if you will, please, Mr. Magladry: How many cars a day would you estimate would be available for shipment via the cross-State line from western Oregon? (2451.)

A. Well, it should reach about 200 cars; taking 70 per cent of the capacity, over three hundred carloads a day capacity, and 70 per cent of that would be practically 200.

Q. Yes. Now, I notice by the exhibit introduced as Exhibit 26, Mr. Wiggins for the State, the petitioner, at page 36, the total number of cars of forest products moving east through Portland via all gateways, the Great Northern, Northern Pacific, and
1320 Oregon-Washington Railroad & Navigation Company, is 2,756 cars for 6 months, or 5,512 for the year, that the total of forest products moving east from western Oregon via the Ogden gateway is 10,015 cars for six months, or 20,030 cars for the year, making a total of 25,542 cars. That would be about 85 cars a day if all of them were turned over and moved via the cross-State line. You wouldn't expect to increase that more than a hundred per cent, would you?

A. Why, Mr. Spencer, the only answer I can give you is to say that we have got the cutting capacity of these mills, and our information is that about 70 per cent of it goes east, and that answers the question. I can't combat another man's statement as to——

We do not include Portland. (2452.) Portland has some of the largest mills in the State, Inman-Poulsen, Eastern & Western Lumber Company, and several of the other mills there on tidewater, but we have some mills in the valley that will equal anything they have. I think Silver Falls mill will cut as much lumber as Inman-Poulsen or the Eastern & Western Lumber Company. Silver Falls have a two-shift capacity of half a million a day, Silver Falls at Silverton; Mr. Woodward operates it. They have a large production in Portland, but a large part of it is shipped out by water. That is true as to Eastern & Western and Inman-Poulsen; they make heavy sales right here in Portland; the large part of their sales is water shipments.

Q. Where is this big mill, at Silverton——

A. At Silverton.

Q. The Silver Falls Timber Company at Silverton?

A. Yes; sir.

Q. Well, that is as close to the eastern market via Portland, practically, as it would be by the cross-State line, isn't it? It would be closer?

A. Closer to Portland? (2453.)

1321 Q. North of Salem, isn't it?

A. Yes, sir.

Q. Well, you don't think any of that lumber would go via the cross-State line, do you?

A. I don't know why it shouldn't.

If it is an advantage to go out of Eugene they can go to Eugene from Silverton as quick as they can go to Portland, and then we have got the saving of time across the State. Silverton is just north of Salem a little bit, forty-six miles south of Portland—and a water level grade and main track available by the Southern Pacific. There is a difference there of forty or fifty miles as between going by Eugene or Portland. The rate would be practically the same. There would be no difference in the freight rates, it seems to me. It is about 75 or 80 miles from Silverton to Eugene. (2454.) They have got the same rate via all these gateways, and they are within 46 miles of Portland, and 80 miles from Eugene, but I would think, other things being equal, they would take the cross-State line as against the Columbia River route as they would save the time of delivery; they would make their delivery by the cross-State line shorter even assuming that 75 miles.

Q. Well, are you sure about that? The equidistant point by the cross-State line as compared with the Portland gateway is Salem, isn't it?

A. I would answer that question by saying this, Mr. Spencer, as I understand it, the distance that is saved east via the cross-State line is 429 miles. Now, can't they afford to ship 75 miles excess on this end to save 429?

Q. I would think they could, and I am wondering and inquiring for the reason that they don't right now—a difference of four hundred and how many miles did you say?

A. '29, I understand.

1322 Q. That is from Eugene to Granger via Ogden?

A. Yes.

Q. Is longer by 429 miles than it is via Portland, and yet they ship via Ogden. Now, the difference I was asking you about was as between the cross-State line and the Columbia River route. (2455.)

Mr. McCulloch. Just a minute, Mr. Spencer. Weren't you confused in your question? Did you say that the route via Roseville and Ogden was 429 miles longer than the route via Portland to Granger?

Mr. Spencer. That is what I understood the witness.

Mr. McCulloch. No; the witness said that the distance is 429 miles less via the cross-State line to Granger.

Mr. Spencer. Yes. I don't want to mislead you. You were comparing Ogden with the cross-State line when you made that difference of 429 miles?

A. Yes.

I don't know how much closer it is to Granger via Portland from Eugene; I know there is a very considerable advantage in distance via the Columbia River route. I don't know whether it is

426 miles shorter to Granger via Portland than it is via Ogden or not. (2456.)

Q. But, now, with all of the Portland mills, the Tillamook mills, and all the western Oregon mills shipping a total of 25,542 cars east a year, via all gateways, north and south, and through the middle route via the Union Pacific, how do you anticipate that you are going to move presently upon the opening of the cross-State line over 60,000 cars a year?

A. From the capacity of the mills and the percentage that goes East.

Q. But not by any performance that has ever taken place?

A. I have no information or any knowledge of your information in regard to twenty-five thousand cars a year.

1323 Q. Well, I am quoting from the record here Mr. Wiggins, who analyzed all the shipments, and it is in Exhibit 26, page 36, a summary at the bottom of the page.

A. I don't know anything about that at all.

Q. And taking actual movements for six months, alternate months through the entire year. Now, is that the only explanation you have, Mr. Magladry?

A. Yes, sir.

The western Oregon mills sell to the railroad, but we are not available to the Union Pacific, or the railroads comprising the Union Pacific system. (2457.) That is because they are of a disposition to buy stuff along their own lines, and they don't come into the Willamette Valley, and consequently we don't get any of that business. There is another reason they can't buy on a parity in western Oregon territory, because they have got to pay a freight rate if they have delivery at Portland; so it would be natural that the western Oregon mills would favor the purchasing railroad, the railroads that purchase their product, if they could. I am not so sure that that natural condition would continue whether there is a cross-State line or not.

Q. Why don't the—the same reasons that actuate these same men will continue to operate as effectively and in the same human way when the cross-State line is built as they do now, won't they?

A. I think they are looking forward to the time when probably there will be a common-user agreement in operating the Natron cut-off, and the cross-State line will be available to the Willamette Valley. (2458.)

The western Oregon mills want competitive operation and better service, better territories to reach, and better deliveries. It is the assumption of that condition by me that I proceed upon in the discussing and in the testimony I have given—we believe

1324 that the building of the cross-State line will develop a territory there that would give us more business, it will be advantageous to the whole State of Oregon from the standpoint of development, and it particularly affects the lumbermen from the standpoint

of making their quicker deliveries east, and possibly getting a better rate into certain points in Idaho. Those are the reasons, and at the same time they are hopeful of someone making an agreement or common user that will let the builders of the cross-State line, whoever it might be, enter the Willamette Valley and serve the mills in the Willamette Valley.

The Denver & Rio Grande and the Missouri Pacific are heavy purchasers of lumber in the Willamette Valley. (2459.) The Denver & Rio Grande takes delivery at Ogden, and the Missouri Pacific takes it from the Denver & Rio Grande. The other railroads, including the Santa Fe, purchase some. You have named the railroads that are the principal purchasers of lumber in the valley (2460.)

Common or joint use of the Natron cut-off by the Oregon-Washington Railroad & Navigation Company, which would bring it into Eugene, would benefit us and the other mills in the valley. Although it wouldn't reach our plant, we would have access to the road that had the common user or the operating agreement. There is no sawmill at Eugene; we are located twenty-five miles from there. I think it would be more helpful for us to have the O. W. R. & N. stop at Eugene than to have it stop at Portland, where it does now. We would still be upon Southern Pacific rails (2461), with a competing carrier 45 or 50 miles away. Booth-Kelly at Springfield is much closer to Eugene than we are. To have the competing line over into Eugene stopping there would benefit us because we would have access to the Union Pacific for shipments over the Union Pacific lines, if they had a common user over the Natron cut-off, and we could reach territory on the Union Pacific that we can't reach now. And another big advantage to us, we would have another railroad to sell to which we don't have now. We can't sell to
1325 the Union Pacific now where it reaches Portland because they don't buy material off of their lines. If they only reach Eugene, didn't go beyond that point south or west or north in the Willamette Valley, our mill and the other mills of our association would all still be off their line, but (2462) I have an idea that, if the Union Pacific had a common user over the Natron cut-off, arrangements would be made so that we could reach that; that the common or joint use would be extended out so that the mills reasonably tributary to that line could reach it.

We cut twelve or thirteen million feet a year; the capacity of our mill is about 60,000 a day. We try to run by the year—300 days a year—there is a certain amount of lost time there, about 50 days, the average would 250 days. (2463.) We are now cutting an average of about thirteen million a year which, we figured up yesterday, would equal five hundred twenty cars, I think.

Q. Now, according to the records of the Southern Pacific Company, you shipped last year, locally and to all points, 335 cars. Do you think that is about right?

A. Well, we were closed down on a logging construction for several months last year. I think we lost three months time last year. We are closed down now—none of the mills are trying to crowd capacity just now. Because of overproduction and the low prices resulting therefrom the market has been in a very bad condition (2464) more or less for the past three years.

Some of our bigger operators, like Silver Falls Timber Company, at Silverton, and the Willamette Valley Lumber Company over at Dallas, and the Spaulding Company, ship a pretty fair percentage of their product into Portland and it is then moved out by water. Export rates have been made for the benefit of our valley mills, in order that they may get into the tidewater distribution here at Portland. This item runs into several hundreds of
1326 cars a year, and to that extent some of our association mills are water shippers.

Exam. ROGERS. Did I understand, Mr. Magladry, some of these 120 cars a day would come from Yamhill County?

A. No—a part of it, yes. I think that we have one member in Yamhill County, the Spaulding Lumber Company. I think that is the only one. One mill is represented in this capacity of 120 carloads a day in Yamhill County. (2466.)

Exam. ROGERS. How large a mill is that?

A. I think they cut about 125,000 a day.

It is one of the large mills in our association, but not one of the biggest.

Exam. ROGERS. Is there any mill included in that 120 cars that is in Tillamook County?

A. No, sir.

Exam. ROGERS. Washington County?

A. No, sir.

Exam. ROGERS. Polk?

A. No, sir; not in the 120 carloads a day. (2467.)

We will probably ship to all points, locally and otherwise, about eight or nine million, that is about 400 cars, from our mill this year. We have practically no local distribtuion in the vicinity of Roseburg. We don't ship anything to Portland, the sash and door factories there don't use our material. We have shipped an occasional car—last year we shipped some seven or eight cars in to a remanufacturing plant here in Portland—the eighteen cars shown by the Southern Pacific Company's record as loaded and shipped to Portland was a little bit unusual. We are not doing it now at all. (2468.)

Q. And of the 335 cars that you shipped to all points last year the railroad company's records show that you shipped 135 into California and territory beyond south. That is about the usual proportion, is it, of your shipments to the south?

1327 A. Well, doesn't that verify my statements as to 70 per cent going east? I think it does.

Q. No, not of your business. That is what I am trying to get at. Now in order to make it clear, let me read you, your mill, according to the railroad company's records, shipped locally around your part of the State in 1927, 22 cars; that is to Roseburg and Eugene and Springfield, and so forth; you shipped 18 cars to Portland, 135 cars into California and other Southern Pacific territory where it is served by the Southern Pacific lines, and 11 cars over into Washington, Montana, and North and South Dakota, and 149 cars into the Idaho-Utah-Wyoming-Colorado territory and territory east thereof. Does that sound about right to you, according to your judgment?

A. Well, that is 50 per cent going east.

Q. Yes, Idaho and Utah.

A. My statement yesterday in regard to the shipments of our own mill was 50 per cent. You will find that in the record. (2469.) The lumber brokers to whom we sell our output always specify the route and we generally follow their request as a matter of courtesy. Sometimes we are affected because of conditions and our relations with the road and we are entitled to make our own routing so long as we deliver the car on the line of the purchaser where he has a siding.

Redirect examination:

The opportunity to make quicker delivery of a car of lumber from the Willamette Valley, and to use the shortest possible route to get it to an eastern destination, would be as important to a lumber broker as to a lumber manufacturer. (2470.) A lumber broker, in specifying or requesting a manufacturer to specify routing of a car of lumber to an eastern destination, would not overlook an opportunity to use a route that would save him in distance and in
1328 time of delivery three days as compared with another route that the car might move, the rates being equal.

We have not experienced any car shortage worth mentioning within the past three years, they always occur when the markets are unusually good. (2471.) The depression in the lumber business is bound to affect the supply of cars.

Exam. ROGERS. Do you know, Mr. Magladry, when you had the car shortages—I take it it was back of 1925?

A. Yes.

Exam. ROGERS. Was there any complaint about it to the commission?

A. Well, I don't know as there was any complaint to the commission, but I know that this same Valley Association that was active at that time had a lot of trouble over it. It was our information that it was not so much a case of shortage of equipment on the part of the Southern Pacific as it was on account of the incapacity of their roads to get them up north. All of these cars had to come through California and they could not get the empties over the hill and

they could not get the loads out. I have seen the thing jammed here where every siding from Eugene to Siskiyous was full of loaded cars that they could not get across the mountain.

That was prior to 1925, I am not claiming any car shortages in 1925. (2472.)

Exam. ROGERS. Was it because of that situation that the commission conducted an investigation into the transportation facilities of the Northwest?

A. I don't know.

Comr. MCMANAMY. Mr. Magladry, have you any knowledge of any instance where the commission ordered a large number of cars routed via Portland because the Siskiyous were blocked?

A. No, I have not.

1329 Recross-examination:

Our association was active at that time in that matter. (2473.) The Valley Association quit activity partly because of depressed conditions, and then we have the West Coast Association which represents the whole Northwest, and we felt that there was a duplication of orginization work, but because of a condition that had no bearing on this case, and I don't care to mention, we felt it was to our advantage to revive the Valley Association. The cross-State line had nothing to do with it at all. It is a matter of selling and grading, where the Willamette Valley was interested and where the West Coast could not well take part with it, and it was to our advantage to revive the Valley Association without duplicating a lot of the work that is carried on by the West Coast. That had no bearing on the cross-State case at all; it was merely a coincidence. (2474.)

Thereupon Thirtieth Annual Report of Union Pacific Railroad Company, year ended December 31, 1926, was marked "Complainant's Exhibit No. 39."

The Thirty-First Annual Report of Union Pacific Railroad Company, year ended December 31, 1927, was marked "Complainant's Exhibit 40."

Forty-Third Annual Report of the Southern Pacific Lines and Affiliated Companies, year ended December 31, 1926, was marked "Complainant's Exhibit No. 41." (2483.)

Forty-Fourth Annual Report of the Southern Pacific Lines and Affiliated Companies, year ended December 31, 1927, was marked "Complainant's Exhibit No. 42."

Thirty-Eighth Report of the Great Northern Railway Company, year ended December 31, 1926, was marked "Complainant's Exhibit No. 43."

1330 Thirty-Ninth Report of the Great Northern Railway Company, year ended December 31, 1927, was marked "Complainant's Exhibit No. 44."

The report for the Northern Pacific Railway Company for year ended December 31, 1926, was marked "Complainant's Exhibit No. 45."

Report of Northern Pacific Railway Company for year ended December 31st, 1927, was marked "Complainant's Exhibit No. 46." (2484.)

Thereupon the petition of the Salem, Oregon, Chamber of Commerce, so offered, was marked filed and granted at hearing without objection, August 16th. (2485.)

The statement entitled "Statement of the Summaries of Assessment Rolls of the Several Counties of the State of Oregon for Year 1927 as Equalized by the County Boards of Equalization" so offered and received, was thereupon marked "Defendants' Exhibit No. 47."

Thereupon the map previously marked for identification "Defendants' Exhibit No. 3, Witness Mullen," was received in evidence. (2488.)

1331 R. E. SHINN was thereupon produced as a witness on behalf of defendants, and, being duly sworn, testified as follows:

Direct examination:

My name is R. E. Shinn. I am employed at the present time by the United States National Bank of Salem and act in the capacity of agriculturalist or agricultural agent for that institution and I give part of my time to that work; and I am also operating a farm of some 400 acres in Polk County, which has no connection with the business of the bank; it is operated separately. I graduated from Oregon Agricultural College in 1914. After having entered the institution for one year I operated and managed a farm in the Columbia Basin, Hood River County, and during summer vacations was employed in that area, and also in the Willamette Valley. It was orchard property that I operated in Hood River County. (2490.) After graduating I leased for approximately a year and a half and operated in a diversified way a farm in Polk County, Oregon, near Salem, and there raised prunes, apples, hogs, and in the dairy business in a limited way. I left this ranch to take over the management of an orchard and poultry property near Mosier, Wasco County, Oregon. This consisted of about 275 acres, 200 of which were in orchard, consisting largely of apples, pears, and some prunes; and also operated quite an extensive poultry plant there; we had on the average of about 1,500 hens. I continued that operation there as his manager for about five years, except the short time I was in the service in the World War. Left this employment to assume the management of an orchard and farm property in Marion County some 7 miles southwest of Salem; it was about a 300-acre place, about 200 acres of which were prunes and English walnuts, prunes being fillers interplanted in the walnuts. In connection with this orchard operation there we produced other kinds of agricultural products, such as hay and feed for working stock, poultry, and some cows and so forth. After about four years of operation at this place I

1332 accepted the district management of the Co-operative Packing Shipping Association of Medford, Oregon, and was (2491)

engaged in the packing and shipping of pears and apples from the Rogue River district. At the end of the year, at the reorganization of this association, at that time they employed a national distributing company by the name of The Denny Company, with its head offices in Chicago, as sales agents and distributors of the products which they had handled. I continued in their employ for about three years. In the employ of The Denny Company. During that time we were engaged in the packing and shipping of fruits and vegetables in the Rogue River district in Oregon, also from the Umpqua district of Douglas County, of which Roseburg is the center, and from the Sacramento Valley and tributary districts of California.

The products handled during that time consisted of pears, apples, prunes, broccoli, peaches, and berries in Oregon, and with my associate in business there from California we shipped grapes, lettuce, onions, celery, peaches, and apples. These shipments both from Oregon and California, were chiefly for eastern destinations. (2492.) This employment with The Denny Company terminated in 1927, and since that time, starting February 1st of this year, I have been employed, as originally mentioned, with the United States National Bank of Salem, Oregon.

1332½ Q. Now, your attention is called to a letter of date July 31st, from W. L. Powers, addressed to you under that date, regarding the Silver Lake project and Summer Lake project in eastern Oregon, and this letter is in the record. The examiner requested you to produce a copy of the letter that inspired this answer. I hand you a letter bearing date July 25, 1928, addressed to Dr. W. L. Powers, Oregon Agricultural College, Corvallis, Oregon, signed "Robert E. Shinn." Is that the letter to which the previous letter referred to is an answer?

A. Yes, sir; said letter of July 25, 1928, reads as follows:

"I am interested to know the outcome of the very recent (2493) soil survey of the soil conditions in that territory adjacent to Silver and Summer Lakes in Lake County, Oregon.

"I was informed at the State engineer's office that you were making such a survey at the present time of lands subject to irrigation. It was stated that there was a question as to whether the land in question could be used economically for agricultural purposes due to excessive alkali or other deterring factors.

"If such information is available at present I would appreciate having it.

"Thanking you for many past favors,

"Respectfully,

"ROBERT E. SHINN."

I have been through the report of Mr. Teutsch, mentioned in his Exhibit 1, regarding the counties in western Oregon from an agricultural standpoint. Discussing them in my own way:

Lake County, according to the agricultural census of 1925,
1333 had in cultivation and in crop 134,110 acres, and had what is called plowable pasture lands—in other words, lands that are cleared and could be handled as pasture or can be planted to grain or any cultivated crops—in addition, 35,000 acres. (2494.)

The principal crops produced consist of wheat, oats, barley, potatoes, and hay. There are in the county some considerable apple and pear orchards. The conditions, I will state here, of the production of these fruits are not favorable from the standpoint of commercial enterprise in competition with the fruit belts of eastern Oregon, eastern Washington, southern Idaho, and northern California. It does, however, sustain a considerable acreage of prune trees, the products from which are in the main evaporated and canned and then shipped to eastern and foreign markets.

Grain and hay produced are to a large extent consumed locally.

Total number of dairy cows in the county in 1925 was about 13,000 head, beef cattle about 95,000, swine 11,500, sheep 40,000, goats 17,500.

The county produces quite extensively small fruits, nuts, and vegetables.

Substantial co-operative package plants have been successfully operated in Eugene for a number of years. At this packing plant the fruits and vegetables are prepared for shipment in various ways, canned, and some dried.

In order to show the relation there between the production of hay in the county and the number of dairy cows, the county had in that year 13,000 dairy cows and produced 58,300 tons of hay. (2495.)

Linn County: Cultivated lands there amount to 177,766 acres, with 70,436 acres of plowable pasture.

Products produced in Linn County are substantially the same as in Lane. Lane exceeds it in the production commercially of fruits, nuts, and vegetables. Linn County exceeds Lane in production of dairy products.

1334 As in the case of Lane County, grain and forage is largely consumed locally.

Linn County ranks third as a dairy county in western Oregon from the standpoint of number of head of dairy cattle, being exceeded only by Washington and Clackamas Counties.

In 1925, the agricultural census of Oregon shows Washington County having the largest number of dairy cows, 15,133, Clackamas County next with 14,322, Linn County third with 13,977.

It ranks second in production of sheep in western Oregon, being exceeded only by Douglas County.

Now to show the co-relation between dairy cows and hay in that county, it has 13,977 dairy cows and produces 66,000 tons of hay annually.

Benton County's cultivated lands comprise 62,962 acres of cultivated land, plowable pasture 30,197 acres.

Line, Lane, and Linn Counties, the products consist largely of wheat, oats, barley, potatoes, and hay, and also has some considerable commercial prune orchards. But in the line of (2496) agricultural enterprise Benton County is primarily dairying and the raising of sheep. In none of these enumerated products does it rank with either Lane or Linn County in volume.

It has 5,600 dairy cows, and produces 28,600 tons of hay annually.

Lincoln County: Out of a total acreage of 645,000 acres, Lincoln County contains only 10,700 acres of cultivated land, and approximately 5,400 acres of plowable pasture. It is a rough, mountainous timbered county. To the limited extent that it produces, its crops are substantially the same as the counties previously mentioned here, but the yield in wheat and barley is almost negligible, and oats is very small. It has 4,480 dairy cows, and produces 12,400 tons of hay annually.

Exam. ROGERS. What was the source of this data?

A. The source of all this data on counties is taken from
1335 the Agricultural Census Report of 1925.

Josephine County: This county has an area in excess of a million acres, with a total acreage in cultivation of 23,400 acres, plowable pasture of 4,222 acres. It produces a small quantity of wheat, oats, barley, potatoes, and some considerable hay. It has 2,300 dairy cows, 2,000 sheep, 2,000 swine. It has commercial orchards in apples, pears and prunes. (2497.)

Its limited agricultural area is due to the fact that it is quite a mountainous county, and the tillable lands are confined practically to small tracts that lie adjacent to the various streams in the county. Irrigation is required for the production of most of its crops, of which alfalfa is he most important, consisting of about 4,000 acres. Fruit, made up largely of apples and pears, comprise its largest commercial production. It has 2,328 dairy cows, and produces 9,350 tons of hay annually.

Douglas County is comprised of more than three million acres, of which 8,300 is in cultivation, 43,400 acres in plowable pasture.

Its agricultural production is of the same nature as Lane and Linn Counties, and the volume of grain, potatoes, and hay is comparatively small. It is the largest prune-producing county in western Oregon, and it has the largest number of sheep of any of the western Oregon counties.

The principal agricultural resource is the Umpqua Valley, where some 400 to 450 cars of broccoli are produced and shipped, mostly for eastern markets. Its greatest commercial resource consists of its production of fruit and nuts. It has 5,573 dairy cows, and produces annually some 37,700 tons of hay. (2498.)

I produced broccoli in Douglas County in the year 1926 to 1927.

Broccoli in that area is produced very largely on what is termed there locally as river bottom soils. In other words, tributary to
1336 the small streams that flow into the Umpqua, and the Umpqua itself, there are alluvial soils there that have been built up,

quite rich, due to the over-flow of these rivers, tributaries to the Umpqua, settled there and made quite a rich bed of soil. Now, this type of soil is the type that has been and is now being used for the production of broccoli. Occasionally, on some years, they have attempted to enlarge its area by going up on the hillsides, on the higher benches (2499), and attempting to produce broccoli on those areas and under those conditions, but that has been practically given up as a failure due to this fact: This broccoli matures in the winter time, along in February, and runs into March, and in order to bring it off at that time this broccoli has to be planted in the month of June, and as late sometimes as early in July. Now, they have practically no irrigation there for any of that broccoli, and certainly not on any of these bench lands or on the hillsides.

This broccoli is set out as a small plant; about, oh, say, six inches high, and is transplanted from beds. Well, it is hard to give this broccoli a start in the first place. They use machines down there with a tank on them, and they are driven by a team of horses down the row, and a couple of men sit in the back, and this machine is so made up mechanically that it draws a—makes a rill and drops about a pint or quart of water every so often, and the man sitting behind sticks the plant down in this water that is left in the rill. The machine covers it up and lets it go. The point is, from that time until maturity of this broccoli, it gets no moisture except that conserved from the winter supply of the winter before, and while growers felt that after seasons when the prices were high that they could go upon the hillsides and higher bench lands to produce this broccoli, they found it was impossible, because they couldn't obtain the moisture there to (2500) mature those crops, at least on a very large scale, so that I would say, in answering your question, that the areas there that are suitable for expansion of that industry
1337 are confined to those alluvial bottom-soils tributary to these streams in the county.

As to the one big year mentioned here, the production of broccoli ran up to in the neighborhood of a thousand cars that year, taking the district as a whole.

There were some bench lands employed in that production, but to what extent I am not sure, but they were producing broccoli on the bench lands that year, and the following year—one reason for that large production that year was not only the amount planted, but they had very good moisture conditions, and as a result the broccoli came through in very good shape with, I would say, better than the average production per acre. The following year this company, which I might say I was connected with here in the production of broccoli, had about the largest (2501) planting in the area—I think we had over a hundred acres in one block there of broccoli and we had a contract there for two years to produce that broccoli—and the next year following was just the opposite kind of a season that the season on which the heavy production was shipped. In other words, they had a heavy season in the spring, and the rains stopped very

early and it was very dry. As a matter of fact, the seed beds, many of them, dried out before they could even get the plans out of those beds to transplant on the acreage. The result was there was a shortage of plants, and even on the bottom lands that year a large percentage, I would say, of the acreage that was set out, the plants wilted and died for lack of moisture. Now, that was due to the dry season. And, as I remember, the production the following year was cut, and that high tonnage of near a thousand cars was reduced the following year to around 230 cars, if I remember correctly.

Now, I wouldn't leave the impression that that was entirely due to the drouth, but it was very largely due to that. There was a decrease in planting that year, because this heavy production
1338 the year previous had been what we term it as a "red-ink year"—there was nothing in it for the grower, due to too large a surplus, and that heavy production in Douglas County coming in contact with a very production in the Guadalupe section of California, and Colma section, in those districts south of San Francisco which are heavy producers. (2502.) There was just too much broccoli on the market and the grower didn't realize anything for his crop. That was partially responsible for the decrease the following year, as well as the drouth period. That was in 1927. There is a chance for confusion there, because this acreage runs over from one season to the next. In other words, it is planted one year and harvested the next. The harvest year was 1927.

As to whether it is a crop that we can depend upon for any s[ta]ble tonnage—or what tonnage we could depend upon from the broccoli production there in Douglas County—I would say an average, under existing conditions, it would average somewhere around 300 cars, perhaps 250 or 300 cars. There are other factors that are limiting factors there, and you may get a heavy production one year and a very light the next. I have mentioned the condition of drouth there. The year before this, I believe it was, 1925, we had a very heavy freeze and reduced the acreage around Roseburg very materially. I think as high as 75 per cent of the acreage was killed out there, and most of the broccoli that was produced that year was produced further south, around Myrtle Creek and Riddle. (2503.)

As far as my experience was concerned there, we had no trouble in marketing our broccoli because of lack of railroad facilities, or if we desired to use the Portland gateway and the Columbia River route, to expedite those shipments to Chicago. I would think that my experience was that of the ordinary producer down there.

Exam. ROGERS. Did this move under icing?

A. Yes, sir.

1339 Exam. ROGERS. Is it perishable?

A. Yes, sir.

Exam. ROGERS. Do you know on what basis the icing charges were assessed?

A. In a general way, yes. The icing of vegetables and broccoli is a little different than fruit. In other words, they ice the bunkers

and generally salt it, and then after the crates are placed in the car they are also top-iced; in other words, the ice is broken up in small chunks and placed on top, so that as the ice melts it drips down over the broccoli and keeps it fresh.

Exam. ROGERS. What do they do about re-icing? (2504.)

A. They are re-iced at regular icing stations, as far as the bunkers are concerned, but I don't believe that there is any more top ice added in transit.

Exam. ROGERS. Is it carried on the stated charges or cost for icing?

It is carried there on stated charges, so far as the icing in bunkers is concerned, and it is optional with the shipper as regards the amount of top ice he cares to use, up to certain limits. There is a limit.

We shipped from western Oregon into the Chicago market. I would say that it isn't a matter of a race between California districts and the Oregon district as to which car is going to get there first, because its shipping season extends over a considerable period, and it is more a question of a car, you might say, shipped out of Roseburg arriving on the Chicago market on a day when there wasn't heavy shipments coming out of California. (2505.) You might by cutting the time short a day arrive there when there was considerable excess of broccoli on the market from the California districts, whereas if it had been a day later it might reach there even under better conditions. That refers simply to the marketing conditions. As far as transportion is concerned, the important primary consideration is the delivery of it in good condition.

1340 Exam. ROGERS. Does that depend somewhat upon arrival of the traffic?

A. Referring to which?

Q. Condition on arrival?

A. I would say yes.

I have finished my statement on Douglas County, except for the statement of dairy cows and production of hay, which is approximately 5,573 dairy cows and some 37,700 tons of hay annually. (2507.)

Jackson County has an area of 1,788,000 acres, of which 93,600 is cultivated; 13,250 acres are in plowable pasture. I do not know how much of Jackson County is in Federal ownership.

Jackson County differs in many respects from the other counties of western Oregon, with the possible exception of Josephine County. One of the chief differences relating to agricultural production is the fact that they produce agriculturally largely under irrigation. Its largest production is in fruit, consisting of apples and pears, which they pick, pack, and ship in what might be termed a large commercial way.

The production of wheat, oats, barley, and potatoes is limited and required in the main for its own consumption.

It has 5,450 dairy cows, and some 26,300 feed cattle, 24,000 sheep and goats, raises 73,500 tons of hay annually.

Coos County has an area of 1,042,000 acres, of which 21,000 acres is tillable land, and 10,675 acres are plowable pasture. It produces wheat, oats, and barley to a very small extent; has 10,370 dairy cows, produces 29,200 tons of hay annually. (2507.) It is also credited with 5,000 beef cattle and 6,000 sheep. To the limited extent it is developed to agriculture it is primarily and essentially a dairy operation. Cultivated lands are intensely rich and productive.
1341 Its main resource is timber and manufactured lumber. Extensive logging operations conducted in the county require the operation of several logging camps.

Curry County has an area of 1,023,000 acres; 7,615 acres in cultivated land, 6,811 acres in plowable pasture.

Due to its natural contours and make-up, this country can never be an important agricultural county, and to the limited extent that it is engaged in agriculture is largely devoted to dairying.

Comr. McMANAMY. Are your comments taken from the census report, or are they your own view?

A. In regard to the future for agriculture?

Comr. McMANAMY. Yes.

A. Largely my own views.

Comr. McMANAMY. Are they based upon investigations which you have made?

A. Yes. It is credited with 3,000 dairy cows and produces some 7,300 tons of hay annually. (2508.)

The more productive counties of the State lie to the north of Lane County. In this classification Marion, Polk, Yamhill, Washington, and Clackamas are outstanding. I should have said western Oregon instead of the State, as that is the district which I am discussing here.

According to the 1926 crop and livestock estimates published by the United States Bureau of Agriculture, in 1926 western Oregon had at that time a total of 162,155 dairy cows. Of this number, the 9 counties mentioned and discussed, that is, that I originally discussed and itemized, had a total of 66,610 head, and the other 9 counties had the balance.

These agricultural counties in western Oregon, taken as a whole, produce agricultural products in excess of their own immediate needs, and these products are of the same class as produced
1342 in southern Idaho and eastern Oregon, except that they do not produce for market beef cattle in any such volume as they do in the eastern Oregon section and southern Idaho.

To the extent that western Oregon and the Willamette Valley produces excessively in these agricultural products it competes with eastern Oregon and southern Idaho in the California markets and in its own local markets.

The suggestion has been made of the necessity of shipping alfalfa hay for consumption of the dairy herds into western (2509) Oregon.

In my opinion such procedure is fundamentally unsound and impractical. While the leguminous seeds are necessary as a component in the ration of dairy cows, they are produced in abundance in western Oregon, and particularly in the Willamette Valley.

The amount of hay shipped in is very limited, and should be. For many years vetch and clover have been produced in western Oregon, and particularly in the Willamette Valley, in excessive quantities, and within recent years an extensive acreage has been successfully developed to the raising of alfalfa without irrigation, particularly in Benton, Clackamas, Clatsop, Columbia, Coos, Linn, Yamhill, Washington, Lane, Douglas, Polk, Multnomah, and Marion Counties.

There are large areas of soil types in these counties peculiarly adapted to the raising of alfalfa, and the increase of same can be accomplished as rapidly as demand requires or justifies. As a matter of fact, there are over 11,000 acres in alfalfa now in western Oregon counties all of which are raised without irrigation, compared with only 3,000 acres in 1925. This is an increase of from 3,000 to 11,000 in a little over two years—three years.

To this 11,000 acres should be added 26,000 acres in production in Jackson County, and 4,000 acres in Josephine County,
1343 making a total acreage at the present time in alfalfa in western Oregon counties of 41,265 acres. (2510.)

A survey conducted by the Oregon Experiment Station at Corvallis for the season of 1925–26 reports an average yield of alfalfa in these western Oregon counties as 3.7 tons to the acre in the nonirrigated Willamette Valley counties, and the cost of production of this hay per ton shall be $9.11. That is in the stack, or harvested. This cost includes every element entering into production, including interest on the land and taxes.

To compete with western Oregon alfalfa, the grower of eastern Oregon must bale his hay at an average cost of $3.00 a ton, haul it to shipping point, and pay the freight into destination on the haul of from three to four hundred miles and I am told the freight rate is 29½ cents per 100 pounds for 350 miles haul, or $5.90 per ton.

With the success of alfalfa on nonirrigated lands in western Oregon now established, it is impossible, in my estimation, for eastern Washington or eastern Oregon growers to enter this market in a competitive way with alfalfa hay.

In this connection, I would state that from soil analysis, that have been made from western Oregon counties it has been conclusively determined that there are available and admirably adapted for the growing of alfalfa in excess of 335,000 acres.

Alfalfa hay produced in western Oregon is for sale at the present time. I will mention here an experience of my own in the past two or three weeks in connection with a farm which (2511) I operate, that I was offered alfalfa hay, baled of good quality, at $14.00 a ton, and this same farmer told me that a man from Coos County had offered him $16.00 a ton for his hay after examining it, but he

wanted the man to store the hay in his barn there for two months before shipment; but, at any rate, this Coos County buyer was satisfied with the quality of the hay.

1344 To show the co-relation between hay production and requirements of hay in western Oregon, I have summarized a table here showing the estimated requirements of hay for total number of horses, mules, sheep, dairy and beef cattle in western Oregon in 1926, and I find the requirements to be in the neighborhood of 810,000 tons.

The total production for that year, quoting the same authority as already have been in these figures and compilations, was 854,005 tons, leaving an excess of hay for 1926 of approximately 45,000 tons. Now, this was computed in the following manner. I might state here that I have gone further than what in my opinion is actually fed to this stock. I have taken in all cases, with one exception, the amount that has been advocated and advised by the college and experiment station as the amount that should be fed to cattle and horses and sheep under the best conditions.

For instance, I have allowed for horses and mules 5 tons. (2512.) As a matter of fact, they are not fed that much, because they are pastured a good part of the time, and this is figured on the basis of stock that is very largely fed in the stall. Taking 69,295 head of horses and mules, at 5 tons, would give you 346,475 tons.

I have allowed for all the dairy cows of western Oregon the amount of 2.3 tons per head, and I have taken that figure because a survey carried on, economic survey carried on by the college over a period of three years figuring the costs of production of dairy products of western Oregon has shown that the amount fed—and I believe that they figured, that they compiled these figures on something like 160 to 170 dairy herds in western Oregon, where the products were produced under the average conditions, in other

1345 words, from small dairies to large dairies, and trying to get at the figures from the standpoint of actual conditions rather than theoretical conditions, and they arrived at that figure, 2.3 tons per head. Now, figuring on that basis gives us 375,256 tons.

There is a small amount of beef cattle produced in western Oregon, with the exception that perhaps Jackson County has more than the average counties in the other districts, and it is rather difficult to tell just how much hay is fed to this beef stock, because they are not raised under a beef cattle country conditions. You might say they are (2513) mostly ranged in the hills, they pick up most of their feed from pasture lands, and in southern Oregon they are fed more hay than they are in the Willamette Valley and coast counties, but I have allowed one ton per head; 71,130 beef cattle at a ton would 71,130 tons.

The figures on sheep in western Oregon in 1926 showed that we had 402,160 head. These sheep, as a matter of practical fact, are fed very little hay. Due to our moist, warm climatic conditions in the winter time, these sheep are fed almost entirely on pasture. Oc-

casionally you will find a man who feeds them a little hay in the winter time. We don't have any snow to cover the ground like they do in eastern Oregon that keeps the cattle away from ground feed, so that they always have access to it, but the college has stated that if this stock should be fed 50 pounds, on the average, of hay, that is, ewes during the winter, that they probably would bring the ewes through in better condition and perhaps affect the quality of wool advantageously, and so I have allowed 50 pounds of hay for sheep in western Oregon, and, figuring on that basis, 402,160 head of sheep at 50 pounds a head would give 12,554 tons.

Comr. McMANAMY. Is the 50 pounds per head the amount that you figure would bring the sheep through in best condition? (2514.)

1346 A. Those are the figures that have been compiled by the college, and if you ask me my personal opinion I would say that it was ample. Those figures—the total of those figures gives a total of 805,415 tons.

In regard to this hay production and the feeding of livestock generally, to get at the possibilities of sound agricultural practice, I have made this note:

No ranch or dairy farm is well conducted that does not produce a maximum of production for its own operation and consumption. Cow, beef, steer, hog, sheep, and poultry are produced and marketed to the end that the products of the ranch may be realized upon to the best advantage, and, in addition to that, the fertility and productive capacity of the farm being maintained and improved as against the exhaustion of the soil, from the standpoint of producing grain and hay, and so forth, and shipping it out of the country, instead of putting it through the livestock and keeping the fertility on the land to increase production per acre. Of course, there are districts where this method of management is impractical. I have in mind the wheat belts of eastern Oregon or eastern Washington, where wheat is produced in very large acreage, large farms, but when it comes to a practical proposition of an 80-acre irrigated farm or an 80-acre farm in western Oregon, unless such a policy and such a type of management is followed the land is gradually depleted until it reaches the basis where it might be termed as marginal acreage, or it doesn't produce enough per acre to pay for the man's labor and his investment. (2515.)

This system of feeding the crops produced on the ranch and marketed in that way through livestock on these smaller types of farms—and when I say smaller types I mean from 40 up to 160 acres—

1347 has been consistently urged by the extension service of the agricultural college, and the necessity of that type of management is recognized and realized by the best class of farmers in the Willamette Valley in western Oregon.

Regarding this hay situation, the shipment of hay into western Oregon has been steadily decreasing for several years, and I would refer to a report and bulletin of the agricultural college, a report

of an economic conference held in Umatilla relative to the Umatilla project, irrigation project there, discussed under date of February, 1926. Quoting from the economic bulletin with respect to the shipment of hay into western Oregon, they state:

"This situation is due to the enormous increase of vetch, clover, and alfalfa hay in western Oregon. In 1925 the 19 western Oregon counties had 393,433 acres of hay. In 1920 there were 327,841 acres. There has been no such corresponding increase in dairy cows, and the increase is almost entirely in clover and vetch, which compete with alfalfa. To this statement might be added the fact that during the past two years alfalfa has come to be a substantial and dependable hay crop in several of the (2516) western Oregon counties stated above. The increased clover and other leguminous crops has also made it unnecessary to ship in alfalfa from eastern Oregon as in the past." Decrease in shipments of western Oregon hay during recent years is shown by the receipts at Portland for the years as follows:

1918–19 there was shipped into Portland 3,263 carloads. In 1920–21 there were 2,317 carloads. In 1921–22 there were 2,098 carloads. In 1922–23 there were 2,684 carloads. In 1923–24 there were 2,196; and 1924–25, 2,134; or a decrease during the period between 1918–19 and 1924–25, a decrease of from 3,263 cars to 2,134 cars.

These figures just given were compiled from the record of inspection of carloads at Portland during that period as reported in the Exchange Service Bulletin above referred to. Of these carloads, a considerable portion of this hay is delivered at north
1348 Portland, and is fed to the stock there, handled by the Portland Union Stockyards Company's yards, where they feed the stock that comes in and has to lay over perhaps a night, or before they are sold there in the yards, and this company handles all the live stock that goes on the market there coming into Portland from outside counties. These shipments were from eastern Oregon (2517); from irrigation districts in which the Umatilla project is interested, either from the standpoint of its own production or from competitive areas that have had hay produced within the project. I have no figures on what came into Portland from western Oregon.

Attention is also called to the further fact that since 1923 there has been an actual shrinkage in the number of dairy cows in western Oregon counties. In 1923 the total, which included matured dairy cows and heifers—this is heifers two years old and older—was 222,000, while in 1927 there was 210,620, as reported by the United States Department of Agriculture, Bureau of Economics report.

I would say the shipment of grain into western Oregon—and when I say that I mean exclusive of the Port of Portland, where grain is reshipped, but shipped into western Oregon for consumption in western Oregon—hasn't obtained in the past (2518), and I can see no way in which it can be anticipated in the future, with the possible exception of a limited amount of eastern corn, and I think the

amount of that will decrease rather than increase. There are several reasons why. In the first place, we can produce good hard corn grown in western Oregon, and there is a factor and an element that enters in there which is rather obscure to the average layman, but it is very important from this standpoint, that diversified farming, or any type of farming in the Willamette Valley which pertains to livestock or dairying must be organized from the standpoint of a rotation of crops in order to carry out a permanent system of
1349 agriculture, in order to keep up and improve the fertility of the land. That system has got to be worked our over a period of three to five years, and the rotation must be worked out so as to give all the land one year out of three or five, depending upon the type and system with which the rotation is worked out, during one year out of that period in cultivated crops, it must give one year in production of clover, alfalfa, and vetch, and leguminous crops of that nature; and then the third year it is turned over to the crops of that nature; and then the third year it is turned over to the production of various cereal grains, ordinarily. (2510.) The fact that one year out of three on a three-year rotation has to be adapted, turned over to the cultivation of cultivated crops, puts the farmer in this position where he has a pretty small, narrow margin to figure what he is going to raise as a cultivated crop, and from a standpoint of an annual crop over the lands that are adapted to dairying and general farming he has practically two alternatives; he has to raise corn or he has to raise potatoes, and it is impracticable entirely to figure that all of the lands in the Willamette Valley, in western Oregon, one year out of three, would be raising potatoes, because you would have enough potatoes there to supply the United States, almost, or a very large area, at any rate, so it is almost a proposition of producing corn.

They produce corn here in western Oregon for ensilage, and men will produce it for feed, but a relatively small acreage will produce a very heavy tonnage of ensilage, so that a farmer is in a position where he is forced on the balance of the acreage over and above what he wants to feed in grain feed and ensilage, into the production of hard grain and corn. This line of argument refers
1350 to the proper type of farming, and all of our farmers don't farm that way, but I will say this, that they are increasing their efficiency, they are following those methods every year, and the college experiment stations are continually (2520) through their country agents hammering on that thing to try to get those farmers to produce more cultivated crops to produce more corn, and I am going to—I would like to state here, to show you their attitude in this matter. (2521.)

There was a bulletin issued by the Oregon Agricultural College, No. 367, under the direction of Mr. Paul V. Maris, who is the director of extension service at the college. Quoting from that bulletin is this statement:

"Corn is principally used for silage purposes, but the warm areas in the Snake and Columbia River Valleys and the Rogue and Umpqua River Valleys, as well as the warm soils in the Willamette Valley, produce good corn for grain. The acreage should be increased by twenty to thirty-five thousand acres to do away with eastern shipments."

That is the attitude of the college on that matter.

Now, as far as what we are actually doing, I have here a copy of statistics on production of corn as shown in the agricultural census of 1925, and in that report it shows that the year previous to the year in which this bulletin was issued, that every county in western Oregon, with the exception of two, Tillamook and Clatsop Counties, produced corn for grain, and the total production in bushels of this hard corn for grain were 428,459 bushels, and went as high in some counties as 95, between 95 and 96 thousand bushels. This is not a large volume of grain, but it does show that these counties are capable of producing this type of grain, and following the line of argument that I mentioned before, they are going to produce more.

1351 Now if I can take up my line of reason here from where we left off on corn. (2522.) I had mentioned the production of wheat. The total yield of wheat in 1925 was participated in by every county in western Oregon except Tillamook, and amounted in the aggregate to 3,741,000 bushels. In 1926 the same counties produced 4,404,790 bushels. The average yield per acre in 1925 was about 21 bushels to the acre. In 1926 the average yield is practically the same—a trifle over 20 and under 21 bushels per acre. The total yield in eastern Oregon was contributed to to a greater or less extent by all of the 18 eastern Oregon counties, and amounted in 1925 to 10,450,000 bushels, while in 1926 it amounted to 14,948,000 bushels.

Comment has been made previously upon the yields in Malheur and Harney Counties, but according to the United States Bureau of Agricultural Economics report these counties are not, nor have they been, large producers of wheat.

In the year 1920 Malheur County produced 145,813 bushels from 5,960 acres, or about 24 bushels to the acre, while Harney County produced 10,519 bushels from 1,159 acres, or a fraction better than 9 bushels to the acre.

In 1925 Malheur County produced 140,671 bushels from 4,936 acres, or 28 bushels and a little over to the acre, while in the same year Harney County produced 7,584 bushels from 991 acres, or an average of 7.6 bushels to the acre. (2523.)

In 1926 Malheur County produced 185,700 bushels from 6,775 acres, while Harney County produced 12,600 bushels from 1,800 acres, or an average of 7 bushels to the acre.

In 1927 Harney County raised 200 acres of winter wheat, with a total production of 3,400 bushels—I might say that winter wheat

that is produced in Harney and Malheur Counties is the dry land wheat, and I have been told by Mr. Kent, who heads this
1352 department of agricultural statistics, that the spring wheat was all produced on irrigated land in those districts. The total production in 1927 in respect to this winter wheat was 17 bushels to the acre. There was 1,800 acres of spring wheat with a total of 27,000 bushels or an average of 15 bushels to the acre. That is in Harney County.

With respect to these figures, I would like to call attention to page 5 on Exhibit 1. The present tonnage of wheat that is designated as available at the present time for shipment from Harney County into western Oregon amounts to 1,530 tons. The figures shown by the United States Department of Agriculture, Department of Crops and Livestock estimates, cooperating with the Oregon Agricultural College extension service in their recent publication of statistics for the year 1927, made this statement:

"Oregon's 1927 wheat crop was the largest on record, with one exception, the 1923 crop, which was only 25,000 bushels larger." (2524.)

This publication on statistics for eastern Oregon counties shows the total production of both winter and spring wheat in Harney County for the last year as 912 tons, or 618 tons less than the total tonnage stated in Exhibit 1 as being available for immediate shipment.

I attribute this difference to the fact that instead of using the figures as given by the Department of Agriculture and the Oregon Agricultural College extension service as the actual production, that the witness in that case has used as a basis for the tonnage of grain produced in that section an amount that was raised at one time on the Warm Springs project and the eastern Oregon branch experiment station.

Calling attention to this fact in correlation with those state-
1353 ments as given by this same division of crop and livestock estimates of Harney County, they show 855 dairy cows and 3,240 hogs.

Exam. ROGERS. Your figure for wheat there, Mr. Shinn, is from the entire county?

A. Yes.

Exam. ROGERS. Is there any of that county's production of wheat tributary to the Burns branch?

A. I think there is, but I am not positive as to the location of that wheat. (2525.)

These dairy cows and hogs are going to have to have some concentrates over in that county, and this Exhibit 1 is calling for the shipment out of that county, immediate shipment, of more wheat than they raised over there last year, and still they have nothing retained for concentrates for the hogs and dairy cows. Take in the case of wheat production of Malheur County; as to what they have given

for dairy cows and hogs there, this same census report shows 855 dairy cows and 3,240 hogs.

Q. Have they retained any feed, or seed, either, out of that 800 tons?

A. Well, as I pointed out, their exhibit calls for shipment of several hundred tons more than they actually produced.

In the case of wheat production in Malheur County, which is on page 1 of Exhibit 5, the statement is made there is now available for shipment into western Oregon 9,400 tons of wheat. The United States Division of Crop and Livestock estimates give the total production of wheat for last year in Malheur County to be 4,920 tons, including all spring wheat and all winter wheat. The exhibit shows available shipments for western Oregon 4,480 tons more than was actually produced in Malheur County last year; and Malheur County, as stated here in (2526) the first part, last year for eastern Oregon was the highest production per acre they have had with one exception.

1354 I again call your attention to the fact that last year Malheur County had 4,645 dairy cows and 8,925 hogs. Doubtless this stock is fed a large amount of alfalfa hay, but they also have to have concentrates to finish them off, in the case of hogs, and to maintain their milk flow on an economic basis.

Oats are raised more extensively in western Oregon than in the eastern Oregon counties. The total acreage for the year 1926 in the western Oregon counties is 264,525 with a production of 7,611,500 bushels, or an average of 29 bushels to the acre. This does not include Klamath County. Every county contributed to this yield except Tillamook County. The total production of oats in the eastern Oregon counties for the same year was only 1,204,500 bushels, raised on 39,475 acres, with an average yield of 30 bushels to the acre.

The barley production in western Oregon counties during the same year amounted to 527,200 bushels from 18,400 acres, or a yield of 29 bushels to the acre.

The eastern Oregon counties produced in barley during the same year 1,759,000 bushels from 63,000 acres, or an average of 27 bushels to the acre. (2527.)

With respect to this grain that is produced in western Oregon, I have given statistics here on wheat and oats, and some figures previously on corn, but the figures, taking the average year's production, will total approximately 13,000,000 bushels, made up of wheat, oats, barley, shell corn and rye in the 18 western Oregon counties.

In regard to poultry feed, the western Oregon farmer, as a rule, produces his own chicken feed. There is a difference in the poultry business in western Oregon. A large part of the

1355 poultry is produced as farm flocks on the diversified farm, or on the fruit farm, which make up a large part of the poultry which forage for a large part of their feed, are turned on to the stubble after harvest and are maintained in large part from what

they pick up around the buildings, and so forth. Then there is the other class that are strictly commercial producers, keep their flocks penned up, and, from the standpoint of districts, a large part of those poultrymen are adjacent and very close to Portland; that is, I would say within twenty to thirty miles radius.

The feeds that are used by these commercial poultrymen, grains, and so forth, are very largely drawn from Portland, due to this fact: That these grains are mixed in order to give what you might call a balanced ration of scratch feed (2528) to chickens, and this feed is prepared and mixed by some half a dozen or more large mills and feed houses located in Portland, and what grain is handled commercially is to a very large extent disseminated from the Portland point to these various poultrymen over the State.

I made inquiry in regard to the ideas of these feed men as to about what proportion, and one man told me he thought that ninety per cent of the poultry feed that was used in western Oregon originated from these various mills that mixed this feed here in Portland.

These feed men obtain their grain from eastern Oregon, eastern Washington, and even from the Willamette Valley and western Oregon, except what corn they use, which comes in from the East. And it is the actual fact that grain is shipped out of the Willamette Valley into Portland, graded there, and certain qualities are used to mix up the poultry feed and ship it back to the Willamette Valley for poultrymen to use in their flocks.

1356 With regard to livestock from Malheur and Harney Counties, all of the carload shipments destined into Portland are received at the yards of the Portland Union Livestock Company. The records of this company show that during the year of 1927 the total shipments from all stations in Malheur County, cattle, calves, hogs and sheep, amounted to 169 carloads, and during the same period the total shipments from Harney County amounted to 145 carloads. (2529.)

With respect to tonnage estimates from western Oregon towns, Exhibit No. 1, tonnage tabulated for the proposed cross-State railroad from western Oregon counties, includes in same a considerable number of carloads of pears from Lane, Douglas, Linn and Benton Counties.

The fact is that the pears grown in all western Oregon counties north of Josephine are primarily of the Bartlett variety and are canned before shipment. The pears from the counties named are not adapted for shipment to eastern markets as green fruit, with the possible exception of a very few isolated instances in Benton and Douglas counties, where a small volume of later winter varieties are raised and shipped.

Josephine and Jackson Counties are, of course, producers of pears in variety and quality acceptable in eastern markets, and are shipped to eastern destinations; and one factor in that, and the chief factor, is the climatic conditions. That is, different climatic conditions as compared with the other districts of western Oregon.

But of the pears produced in Jackson County nearly one-half are of the Bartlett variety, and of this fifty per cent approximately one-half of them are sold to canneries in western Oregon, where they are canned and disposed of as canned fruit. (2530.) I would
1357 assume, therefore, that the pear production in these western Oregon counties are duplicated. The same is included in the Exhibit No. 1 for the several counties north as canned fruit and vegetables.

The same comment could be made in a general way with respect to the estimate in Exhibit No. 1 on the shipment of apples from Lane, Douglas, Linn, and Benton Counties. These counties are not adapted for the production of the quality of apple that will stand up and compete with apple-growing districts such as Hood River, Yakima and Wenatchee, eastern Oregon and southern Idaho, and extensive orchards planted years ago have been, to a considerable extent, neglected and cut down.

It is true that a considerable volume of the apples grown in these counties are canned, and to the extent this is done production is included, as was the case with pears, in the estimate on canned fruits and vegetables.

Apples are shipped from Jackson County. Some of these shipments of apples find their market at the port of Portland and San Francisco as the point of embarkation for export to foreign countries; and Los Angeles is used and looked to for quite a considerable tonnage of the apples out of the Rogue River Valley.

Comr. McMANAMY. Will these apples stand exporting?

A. From Jackson County? (2531.)

Comr. McMANAMY. Yes.

A. Yes, sir.

I would say the apples from other western Oregon counties would not stand exporting. There is a considerable difference in the life of the apples produced in western Oregon and in the districts mentioned. To draw a specific example, you might take one of the leading varieties produced in Hood River, which is the Spitzenberg. There was a time when we thought we could grow Spitzenberg apples in the Willamette Valley and compete with Hood
1358 River in like quality, but as a matter of fact the Hood River Spitzenberg will mature in prime condition, crisp, fine shape, for Christmas market in the East, whereas the Willamette Valley Spitzenberg, which—well, you set them up together and an ordinary person would not be sure they were the same variety, except for the shape—mature, that is the Willamette Valley Spitzenberg matures about Thanksgiving time, and it is not a keeper, and can't compete in any way with Spitzenbergs produced in Hood River or Winesaps produced in Wenatchee, and those who originally went in the apple business here ten or fifteen years ago have very largely gone out, have been forced out through lack of competitive qualities.

Exam. ROGERS. What difference does it make whether they mature at Thanksgiving or Christmas? (2532.)

A. It makes a difference from this standpoint: That the Christmas market is a big market for those kind of apples, and I simply mentioned that to show that they haven't got the storage quality; they haven't got the quality to hold up. It is very desirable from the standpoint of apple production and marketing to have a range of time over which the marketing agent may use his discretion as to the amount to put on the market at a given time and the time to put that product on the market. Now, if you have got a product that is going to stand up for a short length of time, and a short length of time only, it just cuts down his margin of operation that much narrower, and if conditions of glutted markets are such that it would pay to hold that product a little longer his hands are tied in regard to perishable products that have a short life. He has got to throw them on the market and take his chances.

Exam. ROGERS. How much difference in the keeping quality, in point of time, would you expect between the Willamette Valley and the Hood River apple?

A. Well, I would say three months. In other words, while
1359 the Hood River Spitzenberg that I mentioned is to be put on the market at Christmas time, I did not mean to say that was the limit of storage conditions for that apple. They can be held over a considerable time longer than that.

Comr. MCMANAMY. What do you mean by a considerable time, thirty days, sixty days, or ninety days? (2533.)

A. I would say sixty days later than Christmas.

Comr. MCMANAMY. And would the same be true with respect to the Willamette Valley Spitzenberg?

A. No; I would say that the limit of life of the Willamette Valley Spitzenberg would be Thanksgiving time. As a matter of fact, there are practically no Spitzenbergs being shipped out of western Oregon any more, anyway.

Comr. MCMANAMY. Is that true of the Rogue and Umpqua River Valleys?

A. Well, it is very largely true of those districts also. The production of apples in the Rogue River Valley is practically all Newtowns. I don't suppose from the Rogue River Valley there is over half a dozen cars shipped in any one season of Spitzenbergs any more. And they raise a few Spitzenbergs around Roseburg, but they are very highly perishable; in fact, they don't hold up any better than the Willamette Valley apples.

Now I just mentioned the Spitzenbergs there. There are other varieties of apples in the Willamette Valley that hold up longer than Thanksgiving. They raise some Newtowns in the Willamette Valley that will hold up longer, but, taking the thing from the viewpoint of an industry and as a whole, the apple business from a commercial standpoint has practically been given up in western Oregon, with the exception of the small area down there in Jackson County. (2534.)

Exam. ROGERS. To what extent was it regarded as practical before it was given up?

1360 There was a time about 1910 when there were extensive acreages planted in western Oregon, and they have practically all been a failure, I would say, with one exception. There is now at Monroe, Oregon, quite a large apple orchard still operated, and operated scientifically and under good conditions. Outside of that—I think that has about 400 acres, and outside of that one orchard I don't think there is another large commercial apple orchard being operated successfully in western Oregon, in the Willamette Valley.

Exam. ROGERS. Is there any good reason why there should not be other acreage for apple production operated in the same scientific way as that orchard?

A. I would answer that in this way: That the handicaps are so great that it is unprofitable.

Exam. ROGERS. What do you mean by handicaps?

A. Well, one of the handicaps is this: It is a condition relative to the climate. Here in western Oregon we have a moist growing condition. There is a disease that affects deciduous fruits, and particularly apples, known as fungus or apple scab, and it is practically impossible to control it here in western Oregon on apples. It is a black blotch that appears on the side of the apple and the apple becomes deformed and (2535) very often cracks open across this blotch and it requires a spray to combat it. It is a caustic spray, and when it is applied in the summer time it has to be very carefully handled; if not it scalds the fruit and makes the skin of the apple checked and spoils its appearance and throws it in a low grade.

Then we have another disease that is called anthracnose that is even a worse proposition. It thrives under the moist conditions that we have here, and it is a disease that attacks not only the fruit but the tree itself and causes large canker on the bark and will eventually kill the tree if not checked.

1361 The serious part of it is with regard to the fruit itself. It is a fungus disease and attacks the fruit in the spore form. This spore matures and ripens just previous to the harvest time of the apple, and these spores float through the air and get on the surface of the apple, and you can't tell there is any infection there at the time the fruit is picked, but after the fruit is picked and packed in the box it starts a soft rot around where that spore has reached the skin of the fruit, and it means not only a breakdown of that particular specimen in the box but it spreads to other specimens, and you may easily lose the box as a whole.

Exam. ROGERS. Are not other apple sections afflicted in the same way?

A. Southern Oregon has practically no scab at all. (2536.) Hood River on some seasons has a little, but the reason for it is the fact that they don't have the moist late spring conditions that we have here in western Oregon. They have more of an arid climate. Both

of them are irrigated districts; they depend on irrigation for their moisture supply.

I could enumerate several other reasons, but the main reason is the quality of the fruit itself. You stand up fruit produced in Wenatchee, Yakima, and Hood River, and you put up the apples that are produced here in western Oregon, and the main commercial varieties don't look like the same apple at all, an entirely different apple, and won't stand up in long storage.

With respect to the green prune situation in Lane and Douglas Counties, I would say this: It is generally accepted with the prune-growing sections of western Oregon that prunes produced here will not stand successful shipment to distant markets in the Middle and Eastern States.

There are a number of reasons that make the shipment of
1362 these prunes in a green state impossible. First, there is extensive production of green prunes in Walla Walla County, Washington, and in the Milton and Freewater district in Oregon, and southern Idaho, that produce an excellent quality of prune, and they ship it successfully to the eastern market. These prunes are a different texture of prune, thicker skinned, and have actually received more favorable comment in markets than the western Oregon prune. (2537.)

Furthermore, these prunes enter a market at a time when it is called upon to absorb a large volume of pears, apples, plums, apricots, and similar fruits.

The western Oregon prune is, then, second, susceptible to a fungus commonly called "brown rot," which develops under the moist conditions that necessarily obtain in the shipment for long distances in refrigerator cars under ice. There have been instances, and the same will recur, where a producer will speculate on the possibility of disposing of them green where the market at home for a dried product is overburdened, but, as a practical proposition, the prune grower is not in the business in western Oregon to ship his product in green condition. While the production of prunes in western Oregon is substantial, it must be dried for shipment or marketed in the canned state.

Comr. McMANAMY. Have the western Oregon prunes any advantage over the Idaho prunes?

A. From the standpoint of shipment green, no.

Comr. McMANAMY. I was referring to the quality of the prune.

A. No; they have not. I would like to explain to you, though, in this matter of shipment of fruit, quality is not always the limiting factor; it is not the most vital factor. We are a long way from the market here, and with all these varieties (2538) of fruits we have got to have a variety and a product that is going to hold up in firm condition under long transit, under ice and under cold storage
1363 conditions east, with respect to some varieties, and we may produce a variety of fruit here, or a kind of fruit, that is of excellent quality for immediate use; you could put it on the market

here in Portland, or go out and eat it out of the orchard, that would be much better than the quality of the fruit that we ship east, but if you would put that same variety or kind of fruit in an ice car and ship it out it would break down before it got out of Idaho. It would not stand the shipment. So that really one of the most important factors is in the shipping quality of the fruit and the attractive appearance of that fruit after it arrives in the market.

Comr. McManamy. Then if it breaks down before it gets out of Oregon, or Idaho, that completely prohibits its shipment to eastern markets?

A. Yes, sir; now I don't want that misconstrued to say that these prunes break down before they get out of Oregon, because I didn't mean to infer that, but just to bring out my point that the quality is not the main thing in our shipments. It is the quality with respect to shipping conditions, holding up, and correlated with that a dry, attractive appearance after it reaches the market. (2539.)

Exam. Rogers. I would like to ask you here, Mr. Shinn, since we have interrupted you, what is your association with the bank down at Salem?

A. My association there is twofold. In the first place, our agricultural department there is supposed to give service to the client farmers of the bank. In other words, the bank is interested in seeing its farmer clients succeed in their own enterprises; and not only that, it is not limited to the bank's clients; they offer their agricultural service to all the farmers of the community, and my work is largely field work, visiting these farmers at their request on their own farms, assisting them in working out their production and marketing problems.

1364 From the other standpoint, I am used by the bank in assisting the bank itself in determining the advisability of making certain loans to farmers who request these loans, and if there is a question in the minds of the officials as to whether the loan is justified I am sent out to check upon the farmers' operations and report as to the advisability of the amount.

Exam. Rogers. How did you come to be associated with this case?

A. I was associated in this case at the request of the railroad, the O.-W. R. & N., for my services as an agriculturist to check upon the agricultural conditions as they affected (2540) this case, statistics and other standards, simply as a professional service. And I would say here that the bank has no connection with this; it is simply a matter——

Exam. Rogers. Did the O.-W. R. & N. tell you what their position was going to be in the case?

A. I can't remember that they did, but of course I knew their position as the case went on.

Exam. Rogers. Well, did you know it before the hearing?

A. Yes; you mean before the hearing started here in this room?

Exam. Rogers. Yes.

A. Yes, sir; mention was made in the Exhibit 1 as regards the shipment of sheep into California from Malheur and Harney Counties, and Lake County and other eastern Oregon counties. Eastern Oregon and southern Idaho lambs have not moved in large volume to the Pacific coast markets. San Francisco Bay markets have an extensive producing area for their mutton and lamb requirements. The sheep industry is a very important one in central and northern California. Nevada is also a very large producer. In western Oregon the industry is important and is growing in a substan-

1365 tial way year by year, but the lamb raised in eastern Oregon and southern Idaho is grown under entirely different conditions than the western Oregon lamb. The climate of the former is rigorous and develops a much hardier lamb and he will stand shipment well to Chicago and other eastern markets, whereas the western Oregon lamb is (2541) raised in small flocks, in a mild climate, and will not stand the long shipment east, and he has not been shipped east and will not be.

There is, however, a market in Portland and San Francisco Bay Points, and, to some extent, to Los Angeles, for these western Oregon and Washington sheep and lambs.

The growth in the sheep industry in western Oregon has been as follows: In 1920 western Oregon had 289,700 sheep; in 1927 she had 405,000, or an increase in seven years of 70 per cent.

In California in 1922 statistics show 2,475,000, and in 1927, 3,392,000, or an increase of 72 per cent in five years.

There is no basis upon which to estimate with any degree of accuracy the production of hogs in this western country year by year. The fact is that when the price of corn is low in the producing areas of the Mississippi and Missouri River Valleys, the corn is fed in greater increased volume to hogs and the increased production induces shipments to the coast. This condition in the price of corn influences very effectively the production of hogs in this western country.

On the other hand, when the price of corn is high, the Idaho, Oregon, and Washington farmer will increase his hog production and will be a much more important factor in supplying our own western markets. (2542.)

The fact is, however, that hogs are shipped during every year from the Middle and Central States to the Pacific Coast States, and the Pacific Coast States have not and do not produce sufficient quantities of hogs for their own requirements.

This concludes the statement I prepared.

1366 On page 10 of the exhibit by Mr. Teutsch, Exhibit 1, it calls for the shipment of 1,916 tons, or 150 carloads of cream from northern Lake County on this cross-State line. I would think that the logical thing to do, if they went into the dairy business over there, would be to have a creamery and concentrate the products rather than to haul bulky product like cream over into

western Oregon to manufacture it into butter. I assume that would be sour cream. I can't imagine a sweet cream market for 127 cars that that would reach. As to whether that would find market in western Oregon, or go to Portland or San Francisco (2543): The situation with regard to the dairy business in Oregon at the present time is that we are producing all the dairy products we use here and shipping an excess out of the State, and that excess at the present time is almost entirely, at least very largely marketed in California markets, San Francisco Bay markets and Los Angeles, so that an increased production on that side of the mountains there would naturally find a market in California.

While I was discussing the grain production in western Oregon, I summarized the entire grain production as being a total of thirteen million and some excess. I didn't attempt to get exact figures on that figure, for this reason: Corn, for instance, is not tabulated in the Government reports annually. It is only tabulated every five years. There has been no extensive survey made of agriculture by the Department of Agriculture in the last five years, by the Department of Commerce, so I had to go back five years to get that figure on corn. The other figures were taken for last year's production—1926.

Exam. ROGERS. I didn't understand whether you differed with Mr. Teutsch on this cream from northern Lake County or not. (2544.) A. I am hardly in a position to differ with him, because I can't see what his idea was. I can't see why they would be shipping cream out of northern Lake County in a bulky form.

1367 There has been no increase in the planting of apples in western Oregon for a period of, I would say, approximately ten years, at least eight years, from a commercial standpoint. Of course, there are always a few trees going out for home orchards. There have been no new apple orchards put in Jackson or Josephine County; the reverse is true. In Jackson County they have been eradicating their apple orchards on a rather large scale, because they considered that their margin of profit was so much greater on the pears than the apples that they could not afford to keep the apples in there and continually be running behind with them.

(Thereupon, at 12.30 p. m., a recess was taken until 1.30 p. m., Thursday, August 16, 1928.) (2545.)

After recess

R. E. SHINN resumed the witness stand and further testified as follows:

Cross-examination:

My experience, since I graduated from Oregon Agricultural College, has been principally in horticulture, the growing and managing of orchards, fruit ranches, and the marketing of those products.

In my judgment conditions are not favorable in Lane County for the growing of apples and pears for rail shipment. I believe to some

extent apples and pears have been moved by rail to various eastern markets out of Lane and other Willamette Valley counties.

There is some apple production around Newberg. There is one large orchard tract there known, I believe, as the Newberg orchard. That orchard I know something of the history of. It has been on the market and has actually changed hands in trades several times in the last ten years, and is on the market for sale now, I believe. (2546.) Newberg is in Washington County. I am fairly certain that apples have been shipped by rail from the Newberg section.

1368 Q. What has been the condition since you graduated from O. A. C. in 1914 in the apple-growing industry of Oregon and the extent to which you have observed it in Washington? And I suppose you have, because you mentioned Yakima and Wenatchee a good many times this morning in your testimony.

A. Yes, sir.

Q. I mean when I say the condition in the apple-growing industry, have the growers in Wenatchee, Yakima, Hood River, and the Rogue River Valley, as you have observed those conditions in those years, been able to market their apples at satisfactory prices so as to maintain themselves in that period of time and conduct their business successfully from a financial standpoint?

A. Well, in answering that question I could not fairly answer it by putting all of those districts in the same class. (2547.)

In order to answer that question intelligently by districts you have got to go into the economic side of the apple production in the Northwest. The profit realized, if any, by the producers of apples is governed largely by two factors; one, and perhaps the most important, is the tonnage per car; the other is the collective tonnage placed on the market of the country or the world, including foreign markets, as affects the individual producer's tonnage per acre.

Now what I am trying to get at is this: Every producer of apples, or any other agricultural commodity, has a fixed overhead, more or less. It varies somewhat. In other words, his interest on investment, his taxes, his cost of irrigation, his cost of plowing, his cost of harrowing, and so forth, is a fixed charge, whether that man produces 100 packed boxes to the acre of 500; and if, due to natural causes, which include climatic conditions, soil types, and so forth, which influence the production and the quality, he is in an area, in a district, which gives him the maximum tonnage per acre of

1369 the highest quality fruit, his margin of profit is going to be greater than the man who is on a marginal acreage, who is unable, due to physical conditions over which he has no power, such as climatic conditions and soil conditions and the lack (2548) of sufficient moisture, water, under which with his best management, or anybody's best management, he is only able to produce a minimum or average tonnage per acre.

To get at our districts, Wenatchee and Yakima are the heaviest producing districts, from the standpoint of tonnage per acre, in the

Northwest, and they are producing from orchards up there around 400 to 500 packed boxes per acre to, in some instances, as high as 800, and it has been known up to a thousand packed boxes of apples per acre; whereas in Hood River, for instance, their average production per acre is much less, and in southern Oregon their average production per acre is much less.

But you take all of those districts, when it comes to a fixed overhead they have a smaller production of the unit basis, the packed box, to absorb that overhead than in a district where they are producing maximum tonnage.

As a result, consequently on a given market, which all of them have to serve, the man who is producing the maximum tonnage per acre is going to show a wider margin of profit at the end of the season than the man who is producing average tonnage per acre.

Q. I had asked you what the economic conditions have been in the industry since you have graduated from the agricultural college, in connection with the production of apples, so far as the operations in these various districts being financially successful and resulting, generally speaking, in satisfactory profits to the growers. What has been the history in the last fourteen years in that respect? (2549.)

A. I would say that in the Wenatchee and Yakima districts
1370 they have had a narrow margin of profit. I would say that in Oregon, with respect to the Hood River district, that they have had a negligible margin of profit. I would say in southern Oregon that they have had a negligible margin of profit. And I would say in the Willamette Valley it had been a total failure.

It is an absolute fact that in the Hood River and Mosier sections in Oregon, and in the Rogue River Valley in Oregon, there have been, in the past ten years, a great many very fine orchards abandoned and apple growers have gone broke in both of those districts.

Q. Now is the condition in that respect any different in the Willamette Valley than it is in those Hood River and Rogue River Valley producing districts, so far as the apple growing is concerned?

A. Well, if a man goes broke in one district, why, you might say, he can't go much "broker" in another.

It is true generally speaking, here in the Northwest in the last ten or fifteen years, but particularly in the last ten years, there has been little, if any, profit in the apple growing business, and in all of the apple growing sections of the Pacific northwest a great many orchards have been abandoned and many of the apple growers have gone broke. (2550.)

The broccoli of Douglas County compares with broccoli produced in California. Broccoli in California is produced along the coast regions, practically entirely, and it is produced in competition with Douglas County in those districts which lie adjacent to and south of the Bay district. It is produced all the way from Colma on down; as far as the limit is concerned, they produce it around Los Angeles. However the type that is produced around

Los Angeles does not compete with the north, in that it is a different variety. It is really what is known as cauliflower instead
1371 of broccoli and goes on the market before. The limit of territory which competes with the Oregon product would be about Watsonville and Salinas. (2551.) Some of the California broccoli in the territory around Watsonville and Salinas is irrigated and some of it is not. It is grown right down, you might say, to the tidewater. There are large acreages right up to the seashore there, and it is grown inland for a distance of, oh, some twenty miles. I would say that the soil moisture conditions in California where broccoli is grown are much more favorable than they are in the broccoli growing sections of Douglas County; especially in the heavy producing sections around Guadaloupe and Salinas and Watsonville. They are right down there next to the ocean, with a very low elevation, and their moisture conditions are much better, not from irrigation, but from natural soil moisture.

When I was engaged in the broccoli business in Douglas County we made some carload shipments. In some instances we routed them and in some instances we left the routing up to the Southern Pacific. (2552.) When we routed shipments east we sort of split the routing; we shipped part of them by the Portland gateway and part of them by Roseville. We figured it was about an equal break in time to market from either direction. And supplementing my statement there, to follow that, in regard to leaving the routing to the Southern Pacific, we were shipping out of some small siding points and the car had to be picked up by manifest trains. With their manifest trains, sometimes after we would get the cars loaded and billed, the next manifest train would be going south and perhaps it would be several hours before a manifest train would be going north. In that case, as I say, we left it up to the Southern Pacific, and in each case they attached the car to the first manifest train out, regardless of which direction it was going. The shipments that we did route we divided pretty fairly between the Portland gate-
1372 way and the Roseville gateway, I would say if there was any difference, more of them went by way of Portland than the south. With us it was about an equal break in the time taken in transit to Chicago. If anything the Portland gateway gave a little better time, but not much difference. If I remember, it took from ten to twelve days, on an average, for a car of broccoli from Douglas County to get to Chicago, either way it was routed. That all moved in refrigerator cars, which moved east in fast fruit trains after they reached Roseville.

Comr. McManamy. Did you follow the plan of top icing?

A. Yes, sir.

Comr. McManamy. How many tons of ice did you put on top of the load, do you know?

A. I believe it was approximately seven thousand pounds.

Q. While you were engaged in broccoli business in Douglas County and shipping to eastern markets, did you have any claim for loss and damage?

A. Yes, sir.

Q. How were those claims, or how was the damage occasioned? Was it a deterioration of the product? (2554.)

A. Well, frankly, I am not able to answer your question intelligently, for this reason: That this broccoli was shipped account of Denny & Company, of Chicago. Denny & Company, of Chicago, had their own claim department located at their home office, and as these shipments arrived in Chicago if there were any damages claimed they were taken care of from that end and not from our end of the line. Now if—I am trying to get your meaning—if I get what you are driving at there, it is a question of whether the claims were due to breaking down in transit, or——

Q. Well, I wanted to know whether the claims were due to a wrecked or derailed car, or rough handling, or deterioration of the product en route.

1373 A. Well, there never was any complaint, I mean a general complaint, as to the condition on arrival. There may have been individual cars in which there were but as a general thing not.

In my judgment as a broccoli shipper, a saving of two and a half or three days in time of transit of a car of broccoli to Chicago from Douglas County would be of importance to the shipper; it would mean that the product would get to destination in better condition which, ordinarily, would mean that it would command a better price in the market. (2555.)

Exam. ROGERS. How long did you say it took for broccoli to get from Douglas County to Chicago?

A. As I remember, it was from ten to twelve days, and I think we figures fourteen days on eastern seaboard all over.

Comr. MCMANAMY. Do you know whether your top icing would last that length of time?

A. To Chicago, yes; whether it would beyond that I don't know.

Comr. MCNANAMY. You have no records of that?

A. No; I have no personal knowledge of that.

We made no experiments along the line of shipping broccoli in oiled sacks sealed to prevent deterioration. That may have been done, but I have never heard of it.

The original figures I gave of the acreages of tillable land for the different counties were as shown in the 1925 census as actually being planted and growing crops on them, and the plowable pasture was land that was suitable for production of crops but were not in crops during that year. (2556.)

I have been in every western Oregon county, I believe, but when it comes to eastern Oregon counties, there are several I have not been in. I have been through Malheur County on the train, not to make an investigation. I have not been in Harney County. I drove

through Lake County several years ago in a car on The Dalles-
1374 California Highway. (2557.) I have not been in Grant or Crook County; I have been in Deschutes County and down to Bend.

Q. Have you been anywhere except to Bend in Crook County, in getting there, and on the highway going down The Dalles-California Highway?

A. Well, I have been out on some of those roads. I stopped in Bend and drove out in through there, just from the standpoint of interest to look at the country, but it was on a trip through there.

Curry County is the only western Oregon county west of the Cascades in which I have not been. (2558.) I have not been in Baker County except to go through on the train; I have not been in Wheeler County.

Exam. ROGERS. Mr. Shinn, at what points in Douglas County do they load broccoli?

A. They load broccoli in Douglas County at Roseburg, at Dillard, Myrtle Creek, and one other small town—Riddle. There are other sidings between those points at which they load also.

Exam. ROGERS. Those points are south of Roseburg?

A. Yes, sir.

Q. Mr. Shinn, have you ever been in Lake County except as you said traveling on The Dalles-California Highway?

A. That is all.

Q. Well, that highway does not run through any portion of Lake County, so it must have been in Klamath County you had reference to.

A. Possibly I was mistaken. I am not very familiar with that country. (2559.)

Any information or testimony I gave with respect to production, or conditions in any of these counties in which I have not visited was not taken entirely from the 1925 agricultural census
1375 report. My interest in data which I accumulated there led me to make personal inquiry from a number of sources, of people who knew the country, had been in it, and who are recognized as authorities in agriculture in those districts. As far as any statistics which I gave, they were all derived from actual printed reports which are gotten out by the Federal Crop and Livestock Bureau, co-operating with the Oregon Agricultural College extension service. And I may have quoted some from 1925 census, which I believe included the Department of Commerce, Federal Department of Commerce 1920 census of the United States as a whole.

Q. Did you visit any of the western Oregon counties or talk with producers or shippers in any of the western Oregon counties, to obtain information to put before the commission here in this hearing? (2560.)

A. I did, yes; but in most cases I have not given that information as yet.

Exam. ROGERS. You have given all the information you are going to give, haven't you?

A. Unless I am cross questioned to bring it out.

I haven't anything yet to testify to on direct, of the information that I obtained from these statistical sources and from the visits I made in some of the western Oregon counties; that is, if I am asked no more questions I have given all the testimony I came here to give. I went into Coos County in western Oregon to make an investigation for the purpose of obtaining information to present at this hearing. (2561.) I went in no other counties for the express purpose of getting information, other than counties where I have been since I was investigating data relative to this case. Since I was employed to obtain information I went to Corvallis, Benton County and interrogated at some length the faculty down there on certain points, and I made investigations in some points in Multnomah County.

1376 The same is true in Marion County and Polk County, and some of these other counties which I naturally worked into. (2562.)

I consulted with the faculty of Oregon Agricultural College at Corvallis, but I did not consult with Mr. W. L. Teutsch prior to the hearing, or talk with him at all. I have just met the gentleman here in this room for the first time. I made these investigations to testify here at the request and in the employ of the Oregon-Washington Railroad & Navigation Company. I am employed at the United States Bank of Salem for just one-half of my time; the other half is left to my own enterprises.

I spoke of a shrinkage since 1923 of the dairy cows in western Oregon, and I would give the following reason for that. (2563.)

I think we have got a pretty good class of dairy farmers in western Oregon. That is borne out—that opinion is borne out by the fact that while there has been an actual shrinkage in the number of dairy cows, there has been a considerable increase in dairy products. Now, the situation in regard to the market in beef has been a wonderful opportunity for the dairyman in western Oregon, and he has held on for years here to the low producing cows, generally called "boarders," because through natural tendencies he hated to give the cow up as long as it was giving milk. Many dairy farmers don't keep accounts, they don't know whether a cow is exactly on one side of the border of profit or the other, but when beef went up to the point where they could sell a nine or ten-year-old dairy cow that was producing a hundred pounds a year of butter fat for $60.00, they are turning them off pretty fast, and if you will go out to the north Portland yards you will still see trucks driving up and turning off the nine or ten-year-old dairy cows pretty rapidly. (2564.)

There is another factor. I have shown this one largely as the

1377 reason for increased production with a smaller number of head. On the other hand, for several years here California has been absolutely combing the western Oregon territory for cows to take into California, and while they haven't gotten all the best cows they have taken out some good cows along with the average, and

that has certainly been a factor in the decrease in the number of head in western Oregon. But, with this shrinkage in the number of dairy cows in western Oregon since 1923, there hasn't been a corresponding shrinkage in production of dairy products. I prophesy an increase, rather than a decrease, in the number of dairy cows in western Oregon; I believe that there will also be an increase in butter, butterfat, and cheese, dairy products in that territory in the future. (2565.)

I did not say that grain consumption in western Oregon was decreasing—in my opinion it is increasing. The production of grain in western Oregon is adequate to supply the demand for grain in that section.

Q. Is it in respect of corn?

A. Well, in order to answer that question intelligently, there is no fixed demand for corn.

Q. Has it been in the past?

A. As far as the farmer goes, and as a feeder is concerned, I would say very little. Now, I would like to explain that answer. The feeding of livestock isn't a question primarily of feeding a certain type of grain. It is a question of feeding the livestock in balanced ration with the right ratio between proteins and carbohydrates as fed to that animal. That ration can be made up in, I would say, a hundred different ways, and so long as the particular animal being fed is fed that proper ratio of carbohydrates and proteins in a form which is palatable, in a form which that animal desires and will take readily, it doesn't make much difference whether it is corn, wheat, barley, or what it is; but the
1378 factor is and the point is getting these carbohydrates and proteins in proper relation into those animals at the least expense to the feeder. If he can (2566) ship corn in here from the Middle West to feed to this stock at a price to give him this ratio that he desires to get the best results cheaper than he can produce wheat or corn or oats on his own land, naturally there is going to be a market in the valley for that corn.

There have been some imports of corn from Middle Western States into western Oregon—I wouldn't say substantial—but I tried to make this point plain this morning: There is one crop, perhaps one of very, very few instances where the cost of that article is not the contributing factor entirely, and I would say even in a small extent it will grow more so in the future, for the reason that I stated this morning—that it is absolutely imperative to the Willamette Valley farmer to produce a cultivated crop in his rotation, and that crop is logically corn, and whether that production of that corn is costing him more money than he would have to pay for it from the East or not isn't the vital issue; he has got to produce that crop, and the corn is his best crop, and he is going to produce it whether it will cost him more than to ship it from the East or not. (2567.)

I don't know whether there have been substantial imports of corn from the Argentine Republic into all the Pacific Coast States, Portland, and shipped down into the Willamette Valley, or not. I have never heard of it, but if there is any there surely ought to be a duty on it to keep it out.

It was not my idea to give the impression by my testimony that the industry of agriculture and dairying apparently is going back in western Oregon—absolutely the opposite—it is going forward through a reduction of the "boarder" cow, eliminating it from the herds, and the improving of those herds from breeding from
1379 high-type animals, high-producing animals. I would say production and consumption both were increasing, and in my judgment would continue to increase, in the Willamette Valley—in western Oregon counties generally.

You misunderstood my point in regard to the statement that there were enough potatoes in the Willamette Valley to supply the United States, almost. I was making the statement that it was necessary in the plan of rotation of crops to produce a cultivated crop in order to get the best results from the land for other crops. (2568.) Now the western Oregon farmer has a choice of two crops, as far as from a practical standpoint is concerned and market conditions—one is potatoes, and the other is corn—and my point was that if he eliminated the corn and produced all of this land one year out of three in potatoes there would be far in excess of the needs of the Pacific coast potatoes produced in the Willamette Valley in Oregon. I would not advocate that he did that. As a matter of fact, last year there was a large surplus of potatoes produced on the Pacific coast, at a loss for the farmer, and, according to the Government outlook reports on agriculture, there will be another large surplus of potatoes produced on the Pacific coast this year, with another loss for the farmer. Of course, if there is a large surplus of potatoes in Oregon, that means unless they are just simply allowed to rot that that exportable surplus will have to move to the principal markets—that is in an easterly direction—and they have got a surplus in the east as well this year, resolving itself into a loss and economic waste of potatoes this year. (2569.)

Q. Is it your idea that, agriculturally and horticulturally, each county and section in this State, so far as possible, should be self-sufficient, so that the rail movement of products in and out between different sections of the State, so far as possible, should be dispensed with? You mentioned—the reason I am asking that question
1380 is this—I want to leave to Mr. Ellis the question of alfalfa hay, but to illustrate my question I want to mention that—you spoke about the unwisdom and undesirability of thinking of moving alfalfa hay from Malheur County across the State into western Oregon. Now, that is what I had in mind in asking that question. Is it your judgment that economically each section of the State, so far as possible, should be agriculturally and horticul-

turally self-sufficient, so—that is, as far as possible—so as to avoid the rail transportation of products or raw materials in and out?

A. I think that every district will be on a sounder agricultural economic basis if it produces all of its agricultural requirements, but not necessarily does that have anything to do with transportation whatsoever. (2570.)

I did not have in mind that rail transportation might be deemed more or less superfluous for the purposes of a free movement and interchange of agricultural and horticultural products. Livestocks, and the production of leguminous crops, which are all hay and seed crops, are the foundation of permanent agriculture, and the more that line is adhered to by the individual farmer the heavier his production per acre will be, and we get back to the same question that you brought up on the apple proposition, whether he is a dairy farmer or what he is, if he is producing a maximum tonnage of his crop per acre his margin of profit is going to be wider, and the way to bring about that end is by feeding the crops that he raises to his livestock and putting the manure back on the land and raising the leguminous crops, which have the faculty of introducing free nitrogen from the air into the soil itself.

Apples are shipped out of Portland in refrigerated steamers that go to the United Kingdom and various other countries. (2571.) There have been some shipments of apples moved in the past from Jackson County to Portland and thence shipped by refrigerated steamers to various countries in export commerce; and it is
1381 possible that some have from the Willamette Valley, but the Willamette Valley is so inconsequential from the standpoint of commercial apple production that it wouldn't make much difference one way or the other.

I have heard of Denny & Company and Dan Weille at Hood River. As far as Denny & Company are concerned, they didn't follow the practice of assembling and buying apples from over Oregon and Washington and into Idaho and shipping them to Portland to export them to their companies on refrigerated steamers. (2572.) As regards Dan Weille & Company, I don't know what their routings are.

I am familiar with the apple growing section of southern Idaho, around Fruitland, and southwestern Idaho in a limited way. These apples, as compared with those produced in the Williamette Valley, north of Jackson and Josephine Counties, are generally considered of a higher quality as regards desirability for export or rail shipment.

Exam. ROGERS. How do they compare with these Jackson County apples?

A. Well, the Jackson County apple—when I say Jackson County, I refer to the Newtown, because practically all the Jackson County apples are of the Newtown variety, and they are a high quality apple. There are very few Newtowns produced in Idaho; a little hard to

draw a comparison. The Idaho apples, the chief variety over there is the Jonathan, an apple that matures early in the season and is off of the market, practically, before the Newtown goes on, although they produce some Winesaps and Arkansas Blacks over there, and some others, but the Jonathan is the chief variety. (2573.)

Immediately after graduating from the agricultural college I leased a farm in Polk County on which we had about forty acres of apples. This was not a success. It was a miserable failure, due to the undesirable quality of the apples and adverse market conditions. The market conditions, generally speaking for
1382 the last ten years or more, for all the apple sections of the northwest, have been considered by the producer as adverse. There have been years when they made a small margin of profit Last year was an example of this.

Q. I wish you would turn to Exhibit 1, page 15. You called attention to Mr. Teutsch's estimates of apples and pears, fifteen cars of (2574) apples and twenty-one cars of pears, and then you called attention also to the item of canned fruits and vegetables—116 cars. Then you said that the pears of Lane County and in the western Oregon counties north of Jackson and Josephine were of the Bartlett variety and not suited for rail shipment but used for canning, and that you assumed that there was a duplication, therefore, in the case of the estimated apple and pear tonnage in the figures for canned fruits. Do you mean by that that Mr. Teutsch estimated 21 cars of shipments of pears from Lane County and then included in the 116 cars of estimated canned fruits the same pears that were included in the 21 cars under the heading of pears?

A. My statement in that respect, as I remember, referred to Jackson County. (2575.)

Q. Oh, no indeed, I think that it referred to all of the counties, and Lane in particular, all of the western Oregon counties north of Josephine and Jackson Counties, and I wanted to know if you wanted to give the impression by your testimony that you were suggesting that Mr. Teutsch had duplicated tonnage here by first putting in pears, 21 cars, and then including in his estimate of 116 cars of canned fruit enough canned pears to take care of that 21 cars—in other words, to duplicate that pear tonnage twice, once in the raw fruit form, and once in the canned form?

A. As I remember my statement, and at any rate I would wish to be understood, that that situation existed with respect to
1383 Jackson County, and this tonnage here of apples and pears shipped out of Lane County is so small that I wouldn't care to say that it was duplicated. I would say that there was a possibility that there was some duplication of apple or pear or any fresh fruit shipments with canned fruits from some of the counties in western Oregon north of Jackson or Josephine, due to this cause. (2576.) In his exhibit on Jackson County, on page 22, he has shown 3038 cars of pears as moving to eastern markets out of Jackson County, and the average shipment of pears out of that county is

approximately 3,000 cars—I have been told that the maximum shipment was 3,100 cars in past years. The reason that I think that this figure of 3,038 cars is wrong is that I know that in past years approximately half of the Bartlett tonnage has gone to the canneries in western Oregon, and I know through past experience and operation in that valley that half of all the pears produced in that county are Bartletts—that is half the pears in Jackson County are Bartletts—(2577.)

The last time I was in Jackson County was in 1927, at which time I investigated the production of different varieties of pears in the county and the approximate number of carloads shipped as part of my business. I have said that the average shipment of pears out of Jackson County was 3,000 cars a year to all points—if I remember correctly, the testimony was given here yesterday that last year it was less than 3,000. I said that half of the production of pears in Jackson County was Bartletts and that approximately half of the Bartletts went to the canneries in western Oregon—that would be twenty-five per cent of the total tonnage. (2578.)

The Bartlett pears produced in Jackson County move by rail in largest quantities to Salem. Salem is the largest canning center in western Oregon. They have there some half dozen large canneries.

Two of them are owned by large California packing corpora-
1384 tion, and they get perhaps the bulk of the tonnage. Other points that get Bartlett pears from the Rogue River Valley in southern Oregon are Hillsboro, at which Ray Maling has his cannery, and Corvallis, of which Mr. Hutchinson is the manager, and Eugene has shipped pears in from southern Oregon and canned in their cooperative plant. I have sold them to them. From a commercial standpoint I would not say that there was an appreciable or a substantial production of pears in most of the western Oregon counties north of Jackson and Josephine.

I said this morning that the pears produced in the western Oregon counties, like Lane and Douglas and Benton and Linn, and others, were of the Bartlett variety, and were those that went to supply the local canneries. I don't see that that contradicts my other statement, however. (2579.) In addition to all of the pears produced locally in these western Oregon counties they go into Jackson County and take approximately half the Bartlett pear production of that county to meet their requirements. The Bartlett varieties produced half of the pears that were grown in Jackson County and the canneries get half of that, or 25 per cent. The other half of the Bartlett tonnage goes for eastern shipment.

Half of the Bartlett production of Jackson County goes east by rail, but none of the Bartlett production of the counties north of Jackson and Josephine could be expected to go east by rail because the quality of pears produced under the climatic conditions that we have in western Oregon are not suitable for shipment east, and won't hold up in transit.

There are canneries in Jackson County that pack Jackson County pears, but the pack is very limited. There is one cannery at Medford, a small plant, and there is one cannery at Ashland, I think those are the only two canneries in the county.

Q. All right. Now, getting back to this assumed duplica-
1385 tion of the tonnage, do you want to contend now, or assume now, that there is any duplication in the estimated tonnage of canned fruits and of fresh fruits for any of these western Oregon counties north of Jackson and Josephine in Exhibit No. 1? (2581.)

A. I don't wish to enter that as a contention at all. I simply brought up the point as a possibility, due to the fact that in this exhibit three thousands cars of pears are shown as going to eastern shipment, when I know that 25 per cent of them go to western Oregon and are canned.

Green prunes cannot successfully be shipped east from western Oregon. They can be shipped successfully, from a physical standpoint, from down near around Payette, Ontario, southwestern Idaho, and they can and are shipping prunes successfully out of what is known as the Freewater-Milton district, which is up in Umatilla County, and they are shipping prunes, green prunes, successfully from the Walla Walla district, in the southeastern extremity of Washington. They ship a good many plums east from California, but practically no prunes. (2582.)

As to the different shipping characteristics of the plums from California and the green prunes of western Oregon as traffic, I would say it would be considerably more difficult to ship green prunes from western Oregon than plums of different varieties from California. They do not ship green prunes from Clark County, Washington, across the river here, east, to any appreciable extent. Due very largely to the physical make-up of the prune, the same as applied to the other fruits I mentioned, green prunes can be shipped successfully from Walla Walla and the Milton-Freewater district and the Payette district in Idaho, and not from western Oregon. They are entirely different prunes. If the western Oregon prune producers had substantially shorter routes to market, or could get to eastern markets three days quicker than they can now by existing
1386 routes, it would not have much effect on the disability against successfully shipping green prunes east from western Oregon. (2583.)

I have said that hogs in the Pacific Coast States were not produced enough for their own requirements. That is absolutely true of the State of Oregon.

Q. Is it your judgment generally, Mr. Shinn, that any product of western Oregon, as traffic, as rail traffic, is inferior in some way or other to similar products of other sections and States?

A. The question is a little obscure. I don't get your meaning.

Q. Well, as I listened to your testimony all the way through it gave me the impression, and I wondered if I got the right impression, that you wanted to leave the inference or make the point that

the products generally of western Oregon, for one reason or another, were inferior as traffic to like products of other sections or other States, and, therefore, were under a severe marketing disability when it comes to the producers attempting to sell and ship them into eastern markets. Now, was that a point that you wanted to make?

A. Absolutely not, and I can't see that I have left that impression generally. It isn't a question of inferiority of western Oregon products. The opposite is true—western Oregon products are of a very superior quality, but they are not adapted to certain means of physical handling in placing (2584) on the market in ways that were not originally intended for those products. With respect to prunes, the dried Italian prune as produced in western Oregon is one of the finest products that was ever raised, but it never was intended for a fresh fruit shipment, and it never was resorted to until such time as there was such an overproduction and such a surplus of that dried product on the market in competition with Cali-
1387 fornia's product that as a last resort they tried to ship it east green, and it has been a miserable failure.

As to how much of the hay given in my estimate of eight hundred fifty-four thousand tons as having been produced in western Oregon was leguminous hay, I can't give you those figures up to date as affects that particular figure, for the reason that annually there is a report gotten out by the Federal department of estimates, crop and livestock estimates, in conjunction with the extension service of the college, and they do not segregate leguminous and grain and grass hays, but every five years there is what we call the—I have forgotten the name for it, but, anyway, the Government gets out a more detailed report in which it has segregated those varieties. Now, I can give you those segregations in 1925, but not since (2585) then, and they wouldn't correlate with this total figure, because this total figure is for 1926, or the year following, so they wouldn't check. I think I can give it on a percentage basis, so that you may know approximately how much is leguminous, and approximately how much other kinds. The 1925 census shows 107,116 tons of clover hay, 19,790 tons of alfalfa hay, 207,502 tons of grain hay, and 15,104 tons of wild hay. However, I wish to make this statement, that grain hay as listed in here, and most of the grain hay as classified as grain hay raised in the Willamette Valley, is a mixture of vetch and grain hay. There is very little, practically none, figuratively speaking, of straight grain hay produced in western Oregon. It would not be correct to say that substantially only one-third of that total hay production in western Oregon is what is commonly referred to as cow hay, or leguminous hay and the other two-thirds is horse hay, because, as I state, this 207,502 tons of grain hay is a mixture of vetch—generally vetch and oat hay, which is considered first-class cow hay.

Q. But is it not true that authorities on dairying, the agricultural college, advocate the use of, and that dairymen prefer to use, the leguminous types of hay, and particularly alfalfa? (2586.)

1388 A. I would say yes and exclude the "particularly alfalfa." I don't think the statement is correct that for dairy purposes alfalfa hay, especially that grown east of the Cascades, is valued from two to three dollars per ton higher for feeding purposes in connection with dairy herds than other types of hay grown in the Williamette Valley. I do not mean that I don't agree with that myself. I said I didn't agree that it was considered such.

Q. Well, do you believe that the alfalfa does have a feeding value of from two to three dollars more per ton than the valley hays?

A. Now, you say valley hay. We are producing alfalfa in the Willamette Valley.

Q. Than other valley hay?

A. I would say that it had a higher feed value, but as far as saying that it was three dollars more value I wouldn't draw the line at three dollars. I wouldn't say just where that line comes. (2587.) The point is that alfalfa has the higher protein content than other classes of hay. Protein is the highest priced—protein classes of feed are ordinarily the highest priced class of feed, consequently if they can get a hay that has a high protein content it has greater value from that element, that feed element.

At the present time the alfalfa production in western Oregon is very small compared to the total hay production. But it will not be true within five years, and I base that statement on this fact, that only three years ago the entire acreage in western Oregon, exclusive of Jackson and Josephine Counties, which are irrigated—in other words, I mean the counties in western Oregon that are not irrigated had only three thousand acres, and in three years time they have increased that acreage to over eleven thousand, and in one county that I know of they planted a thousand acres in one county this spring. They have just found out that they can grow alfalfa successfully in western Oregon. That thousand acres was planted in Washington County, which is the leading dairy county
1389 in western Oregon, not excluding the coast counties, and only a few years ago Washington County had less than two hundred acres of alfalfa, and today she has forty-five hundred acres of alfalfa. (2588.) That has been within five years time, that increase.

I would advocate the production of alfalfa hay in Marion County on several types of land. I would say, if you want classification of soils, that I would advise it first on the Newberg series of soils, the Newberg loams, the Newberg fine sandy loams, and Newberg silt loams. I would advocate it, second, on the Chehalis types of soils, different various percentage of silt, sand and loam mixed; I would advocate it, third, on the Willamette type of soils, which we have in the Howell section in Marion County, and they are raising it successfully there now.

I would advise it on lands that you might call their marginal acreage, such as the hill lands, and their only limiting factor on those cheap soils of the hill lands is the acid content of the soil, which can be readily rectified by the application of lime.

Q. Well, it is only the marginal lands of lower value that you would advocate the growing of alfalfa on, and not the three or four hundred dollar per acre land in Marion County, is that correct?

A. I didn't know there— What do you mean by three or four hundred dollar an acre land in Marion County? (2589.)

Q. Well, you have a lot of land in Marion County valued that high, haven't you?

A. Well, we have a very small area of agricultural land in Marion County valued that high, and that type of land is what is locally known as Beaver-dam land, of which there is quite an extensive area north of Salem, given over entirely to truck gardening, which is largely celery and onions.

Exam. ROGERS. What do you mean by "marginal acreage"?

1390 A. By marginal acreage of land I mean that type of land which is incapable of a maximum production due to natural conditions which cannot be overcome by the producer. Now, to give you an example, I mean lands where they have frost every month in the year and maybe only a forty-day growing season, the grower has no control over his frosts; or land where it is saturated with alkali and a subsoil of heavy content, where it cannot be washed out, as it can be done in some instances—or, I mean, getting back into western Oregon marginal lands, it will never produce a maximum tonnage of alfalfa per acre which is shown here in the survey of the college as something over three tons to the acre. Now, on this marginal land probably two tons will be the limit. Such acreage is——

Exam. ROGERS. Well, that is an inferior grade of land, is that it? (2590.)

A. Yes; inferior from natural causes which the farmer or producer can never overcome.

From an economic cost standpoint I would that as to the better grades of land, and suggest devoting the better grades of Willamette Valley land to producing alfalfa hay in competition with the irrigated sections of western Oregon. To bear that out, I have here a circular published by the Oregon Experimental Station, under the heading of "Cost of Production of Important Forage Crops in Oregon in 1925 and 1926." This is Progressive Report No. 2 upon the forage cost project, and it was put out under the direction of J. T. Jardine, director of the Oregon Experiment Station, and J. T. Scudder, chief of the department of farm management.

They have carried on over the last two years a very thorough and extensive survey on the farms of western and eastern Oregon, the irrigation projects and the dry land, that is, the unirrigated lands, as well, and by actual contact, as they describe in this circular,

1391 with the producers (2591) themselves, interrogating them on the cost of production, they have arrived at certain conclusions, and I want to give you the cost of production here on these forage crops by districts, also the tonnage.

Malheur district, gives an average tonnage per acre of alfalfa hay produced as 5.1, at a cost of $7.11; Baker and Union district, an average production per acre of 2.9 tons, with a cost per ton of $6.56; Umatilla district, with an average production of alfalfa per acre of 3.1, with a cost of $8.96 a ton; Deschutes district, with an average tonnage per acre of three tons, and a cost of $8.41; Klamath district, with an average production of alfalfa of 3.4, and a cost of $7.72; Rogue River district, with an average of 3.9, at a cost of $9.02 per ton; or an average for all of those irrigated sections of 3.5 tons to the acre, at a cost of seven dollars and ninety some—the last figure is blurred here—per ton. That is all in the stack, unbaled, and it takes these items in making up the cost. (2592.) Direct man labor, overhead man labor, horse labor, machinery, automobile, fertilizer, irrigation, water, taxes, interest on land, depreciation on stand, and miscellaneous.

To get over into the Willamette Valley, the average cost per acre of Willamette Valley hay crops: Clover hay, with a production per acre of 1.8 tons, at a cost of $7.38 per ton; vetch hay, at an average production of 3.2 tons per acre, at a cost of $10.29 per ton; alfalfa, with an average per acre production of 3.7, at a cost of $9.11 per ton; the other is grass hay, and unimportant; cheat hay, two tons to the acre, $8.77 per ton.

You asked me the question as to whether I would advise the production of alfalfa in western Oregon in competition with eastern Oregon projects. In this survey the valuation of property in both
1392 instances is taken into account under the item of interest on land values, and is charged up on the tonnage basis to this hay, so that it is not necessary to draw any comparisons other than that to land values in the production of this crop, and as against this cost as arrived at by the college of this hay in eastern Oregon on the irrigated projects on a tonnage basis I would (2593) draw your attention back to our alfalfa figures, as to the cost in western Oregon of $9.11, as in Rogue River—well, that is in western Oregon, so I won't notice that—but in Deschutes County of $8.41, Umatilla County of $8.96, Malheur, $7.11, Baker and Union, $6.56.

When we can produce a high quality of alfalfa hay—as you said a while ago, it has a high feeding value—at a cost of $9.11 a ton in western Oregon, I would certainly advise the farmers to put in all that they can consistent with their own consumption of livestock. The last figure I gave of cost in the Willamette Valley on alfalfa hay was $9.11, with an average production per acre of 3.7 tons. These figures are issued here under the heading of tests made up on experiment stations of the Oregon Agricultural College. I don't know as I heard Mr. Teutsch's explanation of how they were made up, but the man who made up these figures is Mr. Scudder, the chief of the department of farm management, who has been there for twenty years, made this statement to me in turning this copy over to me—he said, "The eastern Oregon irrigation districts cannot compete (2594) with western Oregon produced alfalfa, and it will

never be practical for them to ship alfalfa into those sections in competition with the quality of alfalfa hay that we are producing in the Willamette Valley at these figures." I don't know whether he was taking into consideration in that discussion present transportation facilities and rates and length of haul or not, but I imagine he was. He knew it would have to be hauled over here. I would say from my experience that it is not true that Willamette
1393 Valley dairymen are buying and using in substantial quantities alfalfa hay that is produced in eastern Washington and eastern Oregon. (2595.)

Exam. ROGERS. Mr. Shinn, I got the impression from some of the witnesses—that is, that it was their impression—that the land was so valuable in the Willamette Valley for the production of other crops that it would bring a greater return—that these witnesses thought that it would be better to devote that land to raising other crops insead of devoting it to alfalfa, and import their alfalfa from other sections.

A. Yes; well, that isn't the case. Had I been in a position to question those witnesses I would have asked them to state what crops they had in mind that would be more profitable for production from the standpoint of the producer, but I wasn't in a position to draw that answer out, because as a matter of fact, the western Oregon producer of a great variety of crops has been fooled and has been laboring under a hallucination in many instances that he couldn't grow staple crops on account of inflated values on that land, which were fictitious values, and as a result he has got an overproduction of prunes and no crop—he had this last year more loganberries than the canneries could take, and they dried up on the vines; he had more strawberries than the canneries would consume at a profit to him, and so on down the line with practically all of these so-called high producing crops that would give him a wide margin of profit—it is fictitious.

Exam. ROGERS. I got this from some of the witnesses, also, that in some of the dairying activities they thought (2596) it would be better to devote the acreage to pasture instead of to raising alfalfa, and import their alfalfa.

A. From what I heard of the testimony I think that was from witnesses from coast counties—Coos and Tillamook Counties— they have there a different condition.

1394 We can divide western Oregon up into three dairy sections that are operating under different conditions. The Willamette Valley is the big dairy section, both from the standpoint of the number of cows and the value of dairy products. Then we have the coast section, which is made up of Clatsop and Tillamook and Coos and Curry Counties, which are right next to tidewater, and they have a moist climate there, and it is more difficult for them to cure their hay. And they have another condition there whereby they can maintain a pretty fair stand of pasture throughout the summer, where they cannot in the Willamette Valley. They feed

some ensilage during the summer and cut corn green and feed it to the cows and give them other green feed. Well, another case of inflated values. Here some years ago, those counties of Tillamook and Coos, pasture was good there, and the grass was green and heavy and they started in there with those cows and gave them a wonderful production, (2597) with the result that that land jumped in value, it went up as high as—actually some sales in Tillamook County as high as a thousand dollars an acre, but after they had pastured those lands over a period of years that rich virgin grass and all—became just a little bit shorter every year, and the pasture wasn't quite so good, until it has reached the point now, where they were feeding several head to the acre in those days that they have come down to pretty short pickings for one cow to the acre during the dry months of the summer, and as a result, too, the lands, when it comes to actual purchase, have reached the point where their value is more nearly $200.00 to $250.00 an acre on that land. (2598.) That is in Tillamook and Coos Counties, and I got those values direct on my visit down there to Coos County last week, talking to the feeders.

Comr. McManamy. Following your suggestion, what would you substitute for this acreage of loganberries and prunes, and so on, that are not profitable?

1395 A. There is one of the largest problems that we have in western Oregon today, and it is a problem that we are up against every day. In many cases those farms can be reorganized to go into other pursuits. Sometimes they are on a type of soil and location where it is very difficult to reorganize them, and it is the biggest problem we have on our hands today to know what to do. Those men are some of them discouraged, but I will say this, in answer to that original question—and in the position that we are in there in my work I have a chance to know that the men who have the money, the farmers in the Willamette Valley, in the Salem district, who have the money today and are in the best financial condition are dairy farmers and sheep producers, especially sheep and dairy men and men that are raising some livestock—they are in far better condition than the small farmer who is raising a concentrated crop on a very few acres. (2599.)

Comr. McManamy. Well, isn't it a pretty general proposition that the berries and fruits are raised on comparatively small tracts?

A. Yes; that is true, small tracts. I would say that the prune orchards will average, oh, from twenty to forty acres in Marion County. A good many of them on up as high as a hundred. On the other hand, there are a great many small tracts, and the movement today is not from large to small tracts—it is from small tracts to large tracts, to get away from this surplus of fruits that we have that confronts us over the country as a whole, and to get back to the ground floor of agriculture, which is livestock in the Willamette Valley, dairy and sheep.

Comr. McMANAMY. That would be, then, the consolidation of a great many of these small tracts into larger holdings, on which it would probably be profitable to raise livestock and general farm products?

1396 A. Well, theoretically so, but unfortunately practically it isn't so, because, as I say, many of those fruit ranches are up on a hillside and are not adapted to uniting several of those farms under one head, and the human element enters in, and it just isn't brought about. It is a problem that we haven't solved yet.

Comr. McMANAMY. Now, coming through Jackson and Douglas County a short time ago I noticed a great many orchards there. To what extent would it be more profitable to pull up those orchards and go into general farming? (2600.)

A. I don't think it would be profitable in Jackson County. Jackson County is a fair district, and I think that is their best crop, on the proper type of soil. Of course, they have a great variety of soils in Jackson County. Some of them are not adapted to the production of pears at all.

Comr. McMANAMY. Well, what I was leading up to, would it increase or decrease the production, and would it improve the prosperity, the general prosperity, of that section of the country, or otherwise, to make a change, which I gather from your testimony you think would be beneficial?

A. The points that I made there—or my discussion referred more to the Willamette Valley. Jackson County, you might say, stands by itself. It is an entirely different country from the Willamette Valley. It is different from a climatic standpoint. It has soil there that don't occur anywhere else in Oregon. It is a higher elevation than the Willamette Valley by 1,500 feet. It is more like the northern California climate than it is an Oregon climate.

Exam. ROGERS. Well, are we to understand that they used to import some alfalfa into Coos and Tillamook County?

A. It was a little hard for me to get the exact situation when I went down there. The statement was made to me by a man

1397 that was in authority to say that they were raising enough hay to take care of their crops. Another man told me that during (2601) the very rainiest part of the season they could afford to buy a ton of hay at $25.00. I interviewed another man, who was the largest man that operated in the district, operated several thousand acres, and a large dairy herd, and was looked up to as one of the progressive men in the community. He told me this, that he had kept accurate accounts on his dairy herd and his operations for several years, and he had come to this conclusion, that when he reached the point where the price of hay was $16.00, alfalfa hay, he would buy hay; when it got above that he couldn't afford to buy it and feed to his cows, as against the type of hay that he produced on his own ranch, and he had his figures from an actual production standpoint.

Unfortunately I did not talk to the county agent over there and get his opinion on that. When I was there I tried to look him up, and couldn't find him. But, knowing all the facts, I think I would be willing, on the basis of my one day's investigation in Coos County, to set my judgment ahead of the county agent who has studied the problem for several years. (2602.) Because statistics show from Coos County's own economic conference, and the figures they gathered here only, I believe, it was two years ago, that their average production of butterfat for that county was only 196 pounds to the cow, and there is no cow will pay that doesn't produce 250 pounds of butterfat to the year. Now, if their general average of production in Coos County on cows is less than 200 pounds, they can't afford to pay $20.00 for hay, nor $16.00.

Q. Well, might not that production be very largely affected by their inability to get the proper kind of hay from the eastern Oregon producing centers?

A. I don't like to answer a question of that kind, because you are limiting the source of their supply to eastern Oregon.

1398 Q. Well, the proper kind of hay?

A. My contention is that their source of supply is and will be the Willamette Valley. As a matter of fact, to make my point clear, I interviewed one of the leading feed dealers, who imports hay for these dairymen; I questioned him about the cross-State line, what he knew about it and whether he felt that it would affect his business as an importer of hay in that district, and he said, "Yes, it will be a great help." (2603.) I said, "Well, in what way?" "Well," he said, "we will be able to get all the hay from Klamath Falls we want." I said, "This road doesn't go near Klamath Falls." "Well, where does it go?" I got out a map and showed him where it went. He says, "That won't help us any." I said, "Why?" He said, "For this reason, that they have got to get that eastern Oregon hay in here at the same price we can buy it from the Willamette Valley, or we will never ship any in."

I imagine that it is approximately correct that, up to the present time, 19,999 tons of alfalfa is the greatest amount that has ever been produced in any one year in the Willamette Valley. It is a new industry. Although, according to Government figures, there is a hay consumption of more than 800,000 tons in western Oregon.

Q. Now, as a general proposition, is it now true that the agricultural development of western Oregon has been governed to quite a large extent, and the products produced have been selected, because of the transportation situation, as much as any other governing factor?

A. Well, when it comes to my figuring the importance of the various factors and what proportion transportation has had, I am not in a position to state, but I would undoubtedly say that transportation had a great effect on a question like that. (2604.)

I made a statement to the effect that the products of
1399 western Oregon are almost identical with those of eastern Oregon and southwestern Idaho, with the exception of beef cattle on the range, under range conditions. The general methods of farming are distinctly different in the two sections, due to the fact that one is an irrigated section, and the other is not. The nonirrigated area in western Oregon produces very largely the same commodities as are produced in the irrigated sections of southwestern Idaho. I wouldn't say that those commodities go very largely to the same markets. I would say that a great many of them go to the same markets. In other words, when I say that, there are many of our products produced in western Oregon the surplus of which goes to California. We look to California first for our surplus. If she won't take it; why, we ship it East. And the same is true, I believe, of southwestern Idaho and that section over in Oregon. The testimony here, time after time, has shown that they are anxious to put their stuff into California first. (2605.) Especially is that true with—the point I would like to bring out, that I didn't stress this morning, is on sheep. Our margin of profit to-day for the Willamette Valley farms is greater on the production of lambs for the market than any other line of production, including fruit, the highly specialized fruit. They produce a soft lamb there that absolutely cannot be shipped East, but is highly thought of and prized by the California market and the Northwest market and that is where they go—they go to Seattle, they go to Portland, and they go on down to San Francisco. Now, as the district over there decides to ship their lambs that are capable of Eastern shipment into our territory they are going to shut us off from a buying enterprise with our hands tied on any competitive market outside of the coast. In other words, due to the physical condition of the lambs they cannot be shipped East. We have got to depend on California for our market, and inasmuch as they absorb our market down there it is an absolute setback to our industry.

1400 It is not my idea that southwestern Idaho and eastern Oregon should be prevented from reaching the California markets. I don't think that any district should be restricted within this country by physical means from using any market that they can. (2306.)

I don't think the cross-State line would be much of a factor in increasing the shipment of lambs from southwestern Idaho and eastern Oregon to San Francisco, due to this cause, that the consumption of lambs on the California market is going to depend on the cycle of production and the margin of profit derived from the market conditions as relates to those producing centers from which you state they are going to originate. I said in my direct testimony that lambs are now being shipped to the San Francisco market from Arizona and other points in that section of the country.

Q. How do you account for your conclusion that Idaho lambs will not go there in any material quantity, when they are now going there from Arizona and other points equally distant?

A. I question as to whether the territory from which the greater part of those lambs are coming is equally distant.

Q. Do you know?

A. I am practically positive, because we have two markets, two lamb markets in California. One is Los Angeles, and the other is San Francisco, and when you take the San Francisco market it is a greater market for lambs, and when you take the (2607) distance from those territories into Los Angeles you will find that the distance, if I am not mistaken, is much greater than the territory in which you are interested. From the standpoint of San Francisco, the Willamette Valley, from the question of increase in their time, is going to take care of that market.

Exam. ROGERS. What is it that makes these lambs soft so that they can't be shipped east?

A. It is the method under which they are managed and fed.

1401 Our method in producing lambs most successfully, in the general way it is done here in the Willamette Valley, is almost entirely on pasture. They are pastured on native sod, in some cases on clover sod, and various kinds of pasture, and when the spring season comes, and the lambs—it is time to market them, they put them on a little rape pasture, and finish them off and take them to market. They are raised under mild climatic conditions. The ewe, the mother, is raised under the same conditions. She has never experienced cold, rigid weather, and as a result that lamb has been bred up to be a soft lamb, and it is a fact that is generally recognized that those lambs will not stand up for shipment east; they can't stand it. The other lambs in eastern Oregon are ranged very largely over the Federal range, in many cases, they are raised under (2608) climatic conditions, the ewes are, where it is cold in the winter time, and as a result they have bred up a more vigorous type of lamb. They are a different species of lamb, too, than western Oregon. As to whether they are ordinarily ready for market at exactly the same time—the lamb season generally extends over a long period due to the fact that we have a mild winter season in the Willamette Valley, where the ewes can lamb any time from Christmas to the Fourth of July, and as a result we are producing lambs in the Willamette Valley from one end of the season to the other.

Q. Then to that extent the marketing season is not contemporaneous—there is only a short period of the year when the Idaho lambs would be in competition with the Willamette Valley?

A. I am not positive on that point.

Now, with reference to the shipment of grain to the Willamette Valley, it is not necessarily my opinion that there will be no grain feed shipped into western Oregon from southwestern Idaho and eastern Oregon. There is a theoretical way to look at this, and a

practical way. Theoretically, no, there wouldn't. Practically; yes; there could. Why? Because of the method (2609) in which
1402 this feed is handled. As a matter of practical fact, most of the dairy feed concentrates, and the chicken feed, that is used in the Willamette Valley, is mixed in the mills of Portland, comes down from the Columbia River Basin and is mixed here in Portland in the proper proportions as regards the proper nutritive ratio, and is sent out to the dairy farmer and the poultry farmer.

(Thereupon a short recess was taken, after which proceedings were resumed as follows:) (2610.)

Q. With reference to the item of grain shipments into the Willamette Valley, it is true, is it not, along the line of your answer, that a large part of the Willamette Valley grain is supported, and that a large part of the mill feed and dairy feed is produced from wheat grown in the interior, that is shipped in and blended or mixed, ground at points either at Portland or in the valley?

A. Well, there is the interchange, but to what extent I don't know. I don't think there is any way to get at it.

I have stated that a part of the western Oregon products can not be shipped east in a fresh condition, but it is a fact that the principal market for western Oregon fruit and vegetable products must be in the Middle West and eastern markets, and I would include foreign markets. The product must move in one form or another, and if it doesn't go as fresh fruit it will go either canned or dried, or shipped cold pack. (2612.) I have not taken the position, or intended to convey the idea, that there will not be a substantial production and shipment of various kinds of agricultural commodities from western Oregon eastbound during the coming years.

My work at the bank is to advise banking officials as to the loans that are applied for by farmers, and in connection with that work I have become rather conservative, from the standpoint of
1403 good business, in the matters that come before me for attention. In order to be a good banker you do not have to be a pessimist. I would say the opposite was true.

Exam. ROGERS. Is there any increased settlement by producers along the lines of the Southern Pacific in western Oregon, farmers?

A. That would resolve itself into an interchange of farm real estate property to answer your question in that way.

Exam. ROGERS. I want to know whether there is any immigration into that territory. (2612.)

A. There has been some immigration in, and there has been some emigration out. There has not been within the past few years a volume into those areas from an agricultural standpoint, no.

Redirect examination:

The U. S. national bank at Salem has a very large clientele of farmers, and they are very diversified, all the way from Japanese, of which we have quite a large clientele, producing celery and onions in the Lake Labish district, to berry growers and tree fruit growers,

livestock men and dairy farmers—includes practically all lines of agricultural production. In so far as the bank is concerned, our operations extend over Marion, Polk, some in Linn, Yamhill, and as far south as Benton, and a few scattering accounts even further away among farmers.

Exam. ROGERS. How many farmers do you suppose you have within that area that are clients of the bank?

A. I can get at that. We haven't a mailing list of farmers, but I can get at it in this way: We circularized the district (2613) this spring among farmers, and in order to do that we took a mailing list that was loaned us from the Ford agency there, who had a list entirely made up of farmers within the radius of the Ford
1404 district in Salem, who owned some type of Ford equipment, and it amounted to over 6,500.

I might say in that connection, if the idea is to get a line on Marion County and that district, that Marion County is the leading agricultural county in western Oregon. She raises more wheat than any county in western Oregon; she raises more hogs than any county in western Oregon; she is second in the production of prunes in western Oregon. I can refer to my figures here and give you those. But, at any rate, her total agricultural output, from a financial standpoint, that is the value of her crops, is greater than any county in western Oregon.

In speaking of the different types of soil that were adapted to raising alfalfa, I mentioned the Newberg type. That does not necessarily mean anything geographically with relation to the town of Newberg. These soil types were named by the Department of Agriculture, their soils department, cooperating with the Oregon Agricultural College and their soil department (2614), of which Professor Powers is the head, has been for twenty years. They had to place a name on these various soil types, and there are about fifty of them, and they have placed certain names on soil types that I have never been able to figure out exactly that there was any connection, because we find, for instance, a type of soil named after Salem down in Jackson County in the Rogue River Valley.

The Newberg type of soil is a sedimentary soil that has been built up along the Willamette River and all of its tributaries over centuries of time, due to the sediment deposited there by the overflow of the river in high water.

The Chehalis series is a soil type of a similar nature on just a little bit higher ground, and it is described as a type of soil which was built up in the same way, but, due to the fact that many of these streams have been dredged out, cleaned out so as to
1405 allow for better drainage, many of those types don't overflow any more.

But the characteristics of those two types of soil are the great depth, without any heavy clay subsoil of an impervious nature which might hinder drainage.

Now the Willamette types of soil, which are also admirably adapted to the production of alfalfa, are a valley floor type of soil. In other words, they are never overflowed, but they still have this great depth and well drained subsoil, with (2615) no strata whatsoever of impervious clay nature. And we have large areas of that all the way from Portland on down through Lane County, the largest area being over in Washington County, where they have a good many thousand acres. And that, by the way, is really, from the productive standpoint, the highest valued land in western Oregon. That is, the type of soil found in Washington County. It is also found in Lane and Linn Counties and is found in some quantities in Benton; it is found in Marion, Yamhill, and Multnomah Counties—all the way down the line, with simply a difference in the makeup of subsoil.

In mentioning Newberg here this morning, I think I said it was in Washington County, but, as a matter of fact, it is in Yamhill County. I have had business over there and know that country very intimately. The farm I am operating is in Polk County, adjoining Yamhill, west of the Willamette River. (2616.)

The range in the commercial value of Willamette Valley land, taking as a unit, we will say, 160 acres, with fair to good improvements, from the standpoint of buildings, would be from $50.00 to $200.00 an acre. The $200.00 land is made up largely of these three type soils I have described to you. In fact, this large body over in Washington County, you can buy those farms over there for $200.00 an acre; I have known of some offered at $175.00, but they range around there.

1406 Now, that is about the highest-priced land in the Willamette Valley in any size at all, with the exception of very small limited area of this so-called beaver-dam land, where they grow the vegetables.

These vegetables ship all right. The celery and onions produced on our bog and peat, beaver dam, as well as in the northern part of the valley, are some of the best that are produced in the United States. As a matter of fact, the Lake Labish celery and celery that is moved out of the Troutdale section up here, has been exhibited in Indiana in the National Vegetable-Horticultural Exhibits for several years, and I believe three years hand running the sweepstakes grand prize over all classes was awarded to it. The Troutdale production is over on the east end of Multnomah County (2617), on the Columbia River. The Lake Labish I refer to is just north of Salem.

I have stated that the tendency was from small tracts to large tracts. I would designate a small tract as 20 acres and less, and I would designate a western Oregon large tract of from 60 acres to 200. There is not an impounding of these small tracts into larger tracts, but a migration away from them. In fact, I have had this summer any number of renters on these small tracts in

my territory come to me and ask me if I didn't know of some place where they could get on larger acreage, that they could not make it on the small tracts. They wanted to get into the sheep and dairy business. (2618.)

There are some of these small tracts for sale. Traveling out of Salem, in these districts in which I operate, you can see the for sale signs on the fences along the road.

I have known the county agents for a good many years. I do not want to depreciate the value of these county agents. I think they have their place, and I think they are valuable, but a good many of the boys have not had practical (2619) farm
1407 experience, and they are inclined to be over-enthusiastic, as from a standpoint of hard business facts, relative to a dollars-and-cents profit in farming operations.

Q. Now you were further asked about your employment by the railroad company and where you got all of this information. I gathered you have been over to Corvallis at the college several times, did you say?

A. I work with those men continually. I have been acquained with them and the faculty ever since I entered the institution in 1910. They all know my position with respect to this case. In each case, when I consulted them in connection with this case and these problems that I was considering, I stated my position before interrogating them.

Exam. ROGERS. What is your position, Mr. Shinn? (2620.)

A. My position is in determining the facts in regard to agricultural conditions in which these parties are interested, regardless of where the chips fall.

Exam. ROGERS. I rather understood from your remarks you had taken a position with reference to the case, with reference to the cross-State line.

A. No.

Exam. ROGERS. That is not what you meant?

A. To make myself clear, you no doubt must appreciate the position of the college in a case of this kind. They have to deal, and it is their business to help the farmers in Oregon in all districts, and they have to be careful in the line of testimony they give that might prejudice any agricultural district against the institution, thereby placing them in a position where they can't do any more good for that community. Now, I simply state——

Q. The question has been asked you several times about your connection, or being hired by the railroad companies, as I understand it. Now, I am asking you whether or not, in talking with the
1408 faculty at Corvallis, or in gathering this information, you concealed from them the relation that you had as an employee of the Oregon-Washington Railroad & Navigation Company in assembling this data?

A. Not in the least. As a matter of fact, I made it a point on the start of telling them exactly what my position was. (2621.)

I was employed by the Oregon-Washington Railroad & Navigation Company to make this survey. I had never been employed by it before. I have been acquainted with, or have had any business dealings with the railroad officials of the O.-W. R. & N. Company only in this way: That during the time I was engaged in shipping perishable products I came in contact with their solicitors and agents. Mr. Spencer of the railroad company employed me. Until that time I had never heard of him. (2622.)

No one connected with the railroad company has attempted to solve this agricultural survey and tell me what to do. This study that I have made is my own study absolutely. (2623.)

GEORGE W. BUCK was thereupon produced as a witness on behalf of defendants, and having been duly sworn, testified as follows:

Direct examination:

I am a civil engineer with between twenty-five and thirty years experience. I have been employed with most of the big railroad companies of the West, the Union Pacific more than any of the others. The other companies are the Great Northern, the Canadian Pacific, the Oregon Short Line, the Atchinson, Topeka & Santa Fe, and the O.-W. R. & N., and the Oregon Eastern, and the Utah Copper Company. At present I am county road master and engineer
1409 for Multnomah County. I have been acting in that capacity for three and a half years.

I am familiar with the organization and history of the Oregon Eastern Railway Company, having been employed (2624) as engineer on location and in making the preliminary and the location for that company in the years 1905, 1906, and 1907. I know the route contemplated by the charter or articles of incorporation of the Oregon Eastern Railway Company. The map you have called my attention to, on which are indicated certain red lines extending from Vale across to Natron, near Eugene, and with certain lines running to the south from the main line, is the old location map of the Oregon Eastern Railway; that shows the surveys as made.

(Said map was offered and received and was thereupon marked "Defendants' Exhibit No. 48, Witness Buck.") (2625.)

The Oregon Eastern Railway Company was organized in 1905 and its articles of incorporation provided for a main line running from a point at or near Natron, in the State of Oregon, and thence by some eligible route to a point at or near Ontario, in the State of Oregon.

From this main line branches were authorized by its articles as follows:

Leaving the said main line from some suitable point thereon and extending to a point at or near Klamath Falls in the State of Oregon.

Leaving said first-mentioned line from some suitable point thereon and extending to some point at or near the Agency Plains, in the State of Oregon.

This line is not shown here, but it was a line running north from about Odell to the vicinity of Madras, on the Deschutes River. That line was never adopted; just a preliminary was run on that.

The third line was, leaving said first-mentioned line from
1410 some suitable point thereon and extending to a point at or near Lakeview, in the State of Oregon. (2626.)

Later the articles were amended so as to extend the Klamath Falls branch down to a connection with the Southern Pacific line at Weed, California.

I started in the fall of 1905, and continued in 1906 and 1907 in the making of definite surveys of these routes, and the same were located and, for the most part, adopted in 1907.

The lines thus surveyed, located, and adopted are indicated in red upon the map published by the United States General Land Office in 1906. That is this exhibit just introduced. As indicated by this map, the main line was to extend across the State from Eugene to Ontario. A short piece of track had been built from Eugene to Natron, and also a short branch line from Ontario to Vale, and the intervening distance represented the construction required for a line across the State.

The plan of building a branch line to the south from this cross-State line from a point called "Odell" was determined upon to the end that an improved line, as compared with the existing Southern Pacific main line, might be obtained from Eugene to Weed, whereby the very heavy grades of the Southern Pacific over the Siskiyou Mountains might be avoided.

The grades on the Southern Pacific from Ashland south attained a maximum of 3.3 per cent, and the grades from Weed north a maximum of 3.3 per cent, while on that part of the (2627) cross-State line extending from Eugene to Odell the maximum grade, as finally surveyed, was 1.8 per cent, and the maximum grade from Klamath Falls north was 1 per cent.

Following this survey, a considerable part of the necessary rights of way were acquired for the cross-State line and for the branch south from Odell to Klamath Falls; and the logging railroad
1411 from Weed toward Klamath Falls was acquired and reconstructed, and construction was prosecuted north from Klamath Falls, south and east along cross-State line from Natron, and west from Vale.

The undertaking was a joint enterprise backed by the Union Pacific and the Southern Pacific Company. The construction was prosecuted, with some interruption, until the year 1912 or 1913, when the Union Pacific was compelled to dispose of the control of the Southern Pacific by decree entered in a suit prosecuted for that purpose by the Federal Government. Construction was suspended and left a line from Weed north through Klamath Falls, completed to Kirk, a distance of 128 miles, and the cross-State line south and east from Natron, completed to Oakridge, a distance of 42 miles from Eugene.

The easterly end of the cross-State line was constructed first to Vale, a distance of 15.5 miles from Ontario, which construction was completed in the year 1906. Later the line was extended on west from Vale to Riverside a further distance of 77.2 miles, to which point it was open for traffic in the year 1914. (2628.)

In the year 1916, construction of a still further extension was completed to Crane, a distance of 126.63 miles from Ontario. In the year 1924, another extension was completed to Burns, the county seat of Harney County, Oregon, a distance of 30.16 miles.

The Oregon-Washington Railroad & Navigation Company was organized in November, 1910, and to it, in December, 1910, were conveyed the lines and properties of the old Oregon Railroad and Navigation Company in Oregon, Washington, and Idaho, and the various branch lines and subsidiary lines of that company, except the Des Chutes branch. It also acquired, in December, 1910, the lines extending westerly from Malheur Junction, near Ontario, to Vale, and the Oregon Eastern Railway Company also conveyed to the Oregon-Washington Railroad & Navigation Company, in
1412 December, 1910, that part of the projected cross-State line constructed westerly from Vale as far as Odell, and in the projected branch extending therefrom south, to Lakeview, and the contemplated branch line from Odell to Bend.

In 1912 the Oregon Eastern Railway Company conveyed to the Central Pacific Railway Company, controlled by the Southern Pacific Company, the remaining portion of the cross-State line from Natron to Odell, and the branch therefrom from Odell south, through Klamath Falls, to Weed. This last mentioned (2629) line has since been relocated several miles to the west from Odell and is the line now called the Cascade line of the Central Pacific operated by the Southern Pacific.

The dissolution of the so-called Union Pacific-Southern Pacific merger required by the Supreme Court of the United States operated to leave the Oregon-Washington Railroad & Navigation Company with its projected cross-State line terminating on the east slope of the Cascade Mountains, with access to western Oregon trackage effectively cut off.

The Oregon-Washington Railroad & Navigation Company, after constructing its line west from Vale through the unproductive Malheur Canyon, proceeded with its construction to Crane in the Harney Valley, in the hope that some traffic might be obtained from that valley.

The extension from Crane to Burns was made in the belief that a lumbering operation with substantial output would be conducted at Burns from Government timbered areas to the north, and a railroad has been built north 50 miles to Seneca to haul logs to the proposed mill at Burns, but it has not been completed nor opened for operation.

After expending large sums of money in constructing this railroad from Burns to Seneca and in the erection of a mill at
1413 Burns, the owner of the enterprise suspended the construction several months ago, after Government canceled his stumpage contract because of his inability and failure to complete, equip, and operate the railroad and the mill. (2630.)

The locations adopted by the Oregon Eastern Railway Company were prepared in view of the relations existing between the Union Pacific and the Southern Pacific systems at the time the surveys were made, and the cross-State line was planned for the dual purpose of serving western Oregon, and also of affording, by the branch south through Klamath Falls to Weed, a better north and south route.

The location of the Oregon Eastern Railway Company lines westerly from Crane are not, in my opinion, adapted at all to the situation as it now exists, and a cross-State line extending from Crane, or any other point on the Burns branch, terminating at Odell, or extending on to Crescent Lake, cannot possibly pay its operating expenses, to say nothing of its fixed charges, or interest on investment.

When the Oregon Eastern Railway program was determined upon, it could look to the Klamath Falls district, to western Oregon, to the Bend district, and to the Lakeview country for traffic, but since that time competing railroads have built up the Deschutes to Bend, and south to Klamath Falls. To the extent commercial timbered areas are traversed the timber will be moved to the large mills at Bend, which are dependent upon it, and to the mills south of Kirk, which are also dependent upon these timbered lands. (2631.)

When the previous case was heard, there was a possibility of the establishment of a mill north and west of Silver Lake on the cross-State line, but little can be expected from that district as a resource, or from any part of this Lakeview country, because of the pro-
1414 jected extension of the Oregon, California & Eastern from Klamath Falls, and the standardizing and reconstruction of the Lakeview branch line of the Southern Pacific to Lakeview, and because of the further projected line of the Southern Pacific from Klamath Falls to Alturas. The Southern Pacific Company and the Great Northern Railway Company now occupy the territory after expending large sums in construction.

The yellow line running through the center of the map—Exhibit 3, introduced in the case previously—is the projected cross-State line from Crane to Crescent, petitioned for in this case; the blue line, marked Southern Pacific, down to the point Chemult, is part of the so-called Cascade line; that is the line that was located as the old cross-State line practically to Chemult, or as far as Crescent Lake, except that it has been moved westerly some fifteen or sixteen miles. (2632.) The arrows on the map indicate where it is joint Southern Pacific and G. N. between Chemult and Klamath Falls. Off to the east, springing from this joint line at the junction there

is a line indicated as O. C. & E. Railway; that is intended to indicate the Oregon, California & Eastern. The broken extensions of that line on this Exhibit 3 are the proposed extensions of the Oregon, California & Eastern; they are surveys in those districts. The line in blue from Chemult up to Bend, marked "G. N. Railway," is the Great Northern line from Bend; that is also the joint line to Klamath Falls from Chemult with the Southern Pacific. That is the route from Bend to Klamath Falls operated by the Great Northern. The O.-W. R. & N. lines are shown in red upon the map, reflecting their lines and those operated by them. (2633.)

The Oregon Short Line operates the line from Ontario Junction into Crane for the O.-W. R. & N. The junction between the Oregon Short Line and the O.-W. R. & N. Co.'s main line is at Huntington. That name appears on the east or right side of the map.

1415 The forest reserves are shown on that map, Exhibit 3, outlined in green, and we have colored in blue the areas that have been included in the irrigation projects that have been organized or projected in this part of the State. This does not mean, however, that there is water available for the entire area shown as being in the districts. Outside of these proposed irrigation districts there is practically no land that can be farmed profitably, except for a small section bordering Malheur Lake and the westerly end of Harney Lake, on account of the frost conditions and lack of rainfall. (2634.)

There are two big timber areas in this section of the State, one lying on the north of Harney Valley, extending to the John Day country and westerly towards Prineville, and the other lying west of a line that would follow approximately the easterly boundary of the various forest reserves from Bend to the State line near Lakeview.

In completing the construction of the so-called Natron line, now known as the Cascade line of the Central Pacific, its location was changed and carried several miles to the west from Odell and the connection now suggested is at or near Crescent Lake.

Assuming that the cross-State line be built from a connection with the Burns branch at a point called Harriman at some five miles westerly from Crane, it would proceed, as indicated upon Government Land Office map—we have an exhibit on that, Exhibit 48, all ready introduced as the "Great Sandy Desert"—across through this country west of Harney. That was originally located as a low grade trunk line railroad to handle long haul business that was moving to Portland from western Oregon points from the Oregon-California State line north and, as above indicated, it can not reach this (2635) business, nor can it reach or serve any substantial areas of pine timber, and no line in central Oregon can exist without very substantial support from the pine forests, in addition to the business from western Oregon.

1416 At the time that I made these surveys there the business in western Oregon was moving from Ashland north to Portland to a considerable extent and these western Oregon lines were operated in connection with the O. R. & N.

To build a railroad across the State on the route petitioned for construction would start from a point some four or five miles west of Crane and proceed westerly through the swampy areas bordering Malheur Lake on the north for a distance of about 20 miles.

We then proceed for about 15 miles over alkali flats where the top soil has been blown into sand ridges with no growth except greasewood; here we reach the point indicated upon the map Exhibit 3 as the OO Ranch, where there is a considerable area of natural grass land and some land that can be reclaimed and cultivated.

From this point the line must proceed westerly 115 miles across the "Great Sandy Desert" where it strikes the margin of the pine timber belt. The route traversed to this point extends through a country entirely unsuitable for settlement or development and with no substantial traffic possibilities in sight. (2636.)

It is almost entirely lacking in living water and is not even a good grazing country. The elevations range from 4,100 to 4,700 feet.

This would take us to mile post 250, figured from Vale. Here the line enters a pine belt extending along the easterly slope of the Cascade Range from Bend on the north to Klamath Falls on the south.

This timber belt is tributary to the so-called Cascade or Natron line, to the Oregon, California & Eastern line, to the recently constructed Great Northern line, and to the Lakeview branch of the Southern Pacific. This timber will, for the most part, be
1417 transported to the mills at and tributary to Klamath Falls and Bend.

It is true that milling operations would be practicable, to a limited extent, in the neighborhood north and west of Silver Lake, and in the territory between that point and Klamath Falls, and between that point and Lakeview, and at Lakeview, but to bring this timber to the projected line across the State would now seem to be impossible.

There are some irrigable lands in the neighborhood of Silver Lake and Summer Lake and at Goose Lake, near Lakeview, but Lakeview does its business with the bay cities in California, and now, with its road widened to standard gauge, and with the contemplated construction and extension of the Oregon, California & Eastern line, very little, if any (2637), traffic for the cross-State line is to be expected from either Silver Lake or Summer Lake development, and, of course, none to speak of from Lakeview and the Goose Lake project.

Some business might move westerly from the Harney Valley, but it would be principally seasonal, consisting of livestock and possibly some grain. The country, however, between Crane and the OO Ranch is not adapted to any considerable diversified farming. There is some pretty fair sagebrush during the first few miles leaving the point of connection at or near Harriman, and then you pass through the overflow marsh land on the north of Malheur Lake. From there

on west for about 15 miles is the hardpan soil with some greasewood growth, where the top soil has been blown away and the land impregnated with alkali. From this point you climb the Wagontire Mountain divide and go down into the so-called Christmas Lake Valley, a distance of some 60 miles.

The country traversed is of a scab rock formation, and in climbing Wagontire Mountain it is necessary to accomplish an elevation of about 600 feet above Harney Valley, mostly on a supported
1418 line on a maximum eight-tenths grade and with heavy construction most of that distance. Heavy cuts in this section will average a large percentage of solid rock. The next forty-five miles is across the Christmas Lake Valley with the Fort Rock country in its westerly end. Here a considerable portion of the soil has been blown away but where the top soil remains, it is fair grass range and sagebrush, but otherwise it is hardpan and greasewood. (2638.)

A considerable amount of land in the Christmas Lake Valley and Fort Rock country was taken up in 1910 and 1911 by homesteaders, who attempted cultivation of the land under the dry-farming system. Nearly all of these settlers have left, and where the fences were not destroyed and stock kept out, there has been a considerable growth of wild rye grass. Around Fort Rock there is some acreage that has been dry farmed, rye hay constituting the principal crop. The valley lacks water, and practical means of conveying water to it do not obtain, at least they have not been found.

In the report on the Silver Lake project, irrigation and drainage, of October, 1915, by John T. Whistler of the United States Reclamation Service and John H. Lewis, the State engineer for Oregon—both recognized authorities on irrigation—on page 84, say:

"The soil in the flat east of the Fort Rock Unit occupies land that is too flat to afford suitable slope for irrigation or drainage and it contains a very appreciable amount of alkali which is accumulated on the surface and forms a crust. In places the texture of the soil has a heavier tendency and here the presence of alkali is indicated by the vegetation which is salt grass and greasewood." (2639.)

On page 16, they say that sand ridges form a prominent feature of the topography of the eastern part of Fort Rock Valley, and also parts of Christmas Lake Valley. East of Fossil Lake and
1419 Sand Springs shifting sand dunes reach for many miles to Pine Ridge on the east.

This Christmas Lake Valley comprises some 200,000 acres in extent, but is not promising as a substantial agricultural resource, and I am compelled to agree that the statements quoted from Messrs. Whistler and Lewis' report describe the situation correctly.

From the Fort Rock district to Cresent Lake is about 50 miles; about 35 miles of this is over the Walker Mountains into the Deschutes Valley. It is a rolling country, with a pumice and volcanic ash soil underlaid with solid rock on the ridges. There is a heavy growth of jack and yellow pine, and very little grass, and when the timber is removed it will be practically a desert.

From the crossing of the Deschutes River near the town of Crescent to the junction with the Cascade line of the Southern Pacific the country is rough, the soil volcanic ash and pumice, and the timber is mostly yellow and jack pine.

The junction will have to be near the station of Cresent Lake on the Southern Pacific, which is at an elevation of 4,780 feet above sea level. The Southern Pacific has a three track division yard and facilities at this point, but it would be necessary to build a separate yard, as it would be very (2640) difficult to operate a yard of substantial size for several months during each year, on account of the heavy snowfall at this point. Some winters the snow lays at an average depth of seven feet from November until April.

If the cross-State line is built from the Burns branch to a connection with the Central Pacific at Crescent, it will cross the recently constructed line of the Great Northern Railway from Bend to a connection with the Central Pacific at Chemult.

The resulting distance from Crane to Portland by way of
1420 this Great Northern Junction and Bend would be 468.3 miles, assuming the O.-W. R. & N. into Portland is used from Bend. This distance would compare with the present all-rail route from Crane to Portland, a total distance of 556.3 miles. (2641.)

If the route from Crane to Portland is along the proposed cross-State line to Crescent and thence by way of the Southern Pacific to Portland, the distance would be 409 miles.

If a line springs from the Burns branch at or near Harriman it will not touch a single city or town for the entire distance traversed, except a small settlement at Crescent and the junction point at Crescent Lake, at neither of which does the population total one hundred inhabitants. The line would also fail to serve any town or settlement within a distance of twenty miles on either side of it for its entire length.

On this Exhibit 3 I have shown the distance from the yellow center line on either side, twenty miles, in that shaded area; the distance of 115 miles across the great high desert is shown by this dotted, shaded line, irregularly going northwest and southeast.

I have investigated all of these irrigation districts that are indicated upon Exhibit 3. Ordinarily when we speak of an irrigation district we understand from the use of the expression reclaimed lands (2642) served by canals and laterals, with water controlled and applied for intensive production upon lands in cultivation.

This condition does not obtain to any large extent with respect to any of the so-called irrigation districts or projects that I will mention or discuss in my testimony, except in a limited way at Silver Lake.

The Harney Valley is now served by the line which has been extended from Crane to Burns.

1421 In my testimony in the previous case I classified the lands which might be considered served by the Crane-Odell line, which now may be called the Crane-Crescent line, as follows:

Arid land capable of reclamation, 82,455 acres; pasture or meadow, 148,500 acres; merchantable timber acres, 400,000 acres; land under cultivation, 47,800 acres; waste or range land, 3,376,245 acres.

The so-called irrigation projects which we considered might be served to a greater or less extent by the cross-State line, included the Harney Valley irrigation district, which, as above indicated, is now traversed by the Burns branch.

There are now about 6,000 acres cultivated in this Harney Valley, and some 42,000 acres are irrigated in the sense that the grass lands are flooded from the Silvies River, and a large quantity of native hay is thus produced. Alfalfa and small grains are grown successfully, but the grains are more or less uncertain because of the high altitude and the production largely consumed locally. (2643.) The soil survey of the valley shows that about 16,000 acres in the district is heavily impregnated with alkali.

We then come to the Blitzen project, which, as well as the Harney Valley project, is yet undeveloped, and here we find about 2,200 acres cultivated and some 20,000 acres irrigated in much the same way as is done with respect to the Harney Valley land. It is estimated that this valley contains 34,000 acres capable of irrigation.

The Silver Creek Valley district extends north a considerable distance and is located some thirty miles or more westerly from Burns. The irrigation there now is largely by natural flow and flooding during the spring run-off, as is the case in the Harney Valley and in the Blitzen district.

There have been pending for a long time disputes about
1422 water rights, which may seriously embarrass its development, but it is estimated to contain 16,000 acres of irrigable land, 4,000 of which are irrigated in the manner above described, and about 800 acres of which are cultivated. A considerable part of the valley, however, is located, in our opinion, too far north to be served to very good advantage by the cross-State line.

The so-called Fort Rock project should, in our opinion, be classified as an impossible project. The average annual (2644) rainfall is less than 10 inches. Some two or three test wells have been drilled and driven to a considerable depth, but it must be out of the question to depend upon this expensive and restricted method of obtaining water, with so many projects in this northwestern country available that are served by adequate natural flow and adjacent to railroads.

Furthermore, in the case of the Christmas Lake Valley, the presence of an adequate supply of water is by no means assured, even by the drilling of wells, and the frost conditions, to my personal knowledge, from experience on the desert, makes crop production very uncertain.

In the summer of 1906 I was through this country from Fort Rock to Wagontire Mountain, in July and August, and we kept a record; there was only two nights in that summer, three nights or

mornings, that we didn't have a fire in our camp to keep warm there. We were camping along this location while we were making the survey this way and it was pretty cold.

The Silver Lake district is estimated to contain 6,500 acres of irrigable land, of which 2,000 acres are irrigated and cultivated. (2645.) During the years 1918, 1920, and 1924 the supply of water was very short, and in 1926 there was no water for irrigation.

1423 There is a serious question whether the 4,000 acres of unsettled land can be made productive because of the presence of alkali. The annual rainfall is only about 11 inches and the frost conditions are so bad that it prevents grain from filling properly. Judging from the conditions as they appeal to me, I doubt whether very much traffic would come from Silver Lake to the cross-State line when the Oregon, California & Eastern is constructed to Silver Lake from a connection with the line of that railroad company projected from its terminus at Sprague River.

In my testimony in the previous case, I assigned to the cross-State line about 50,000 acres of timber land east of Odell Junction, but, as I stated then and feel now, much of this timber would probably be delivered to Bend in the log, because a large investment in mills has been made there and undoubtedly they look to this district for their timber supply.

Since that time, construction of the railroad of the Great Northern south from Bend has been completed, and the (2646) disposition of the bulk of the timber to the Bend mills is now, I think, practically assurred. Indeed, there is no place for the cross-State line to take it, unless the manufacture of it was attempted locally near the cross-State line, and this I cannot conceive would be done.

I also referred in the previous case to a stand of about 3,000,000,000 feet of timber on the watershed of streams running into the Silver Lake district, but, as indicated before, I now reaffirm the conclusion, that a very considerable part of this timber is too far distant to move to advantage to the cross-State line. There would be no good mill site in connection with the cross-State line, and it is almost inconceivable that it would move in the log to any point on the

1424 cross-State line, at least for a great many years. These two timber stands would comprise the merchantable timber which I assigned to the cross-State line in the previous case as 400,000 acres.

Some fifteen or twenty years ago a very determined effort was made in the semi-arid regions of the United States to develop lands by the so-called dry-farming method where, by the proper tillage and conservation of moisture moderate crops of grain could be raised every other year where a minimum rainfall of 14 inches was assured; but I think that this dry farming with such light rainfall as prevails in central Oregon has, as a rule, failed of success, and should not be encouraged. (2647.)

Generally speaking, the annual rainfall in central Oregon and in the districts proposed to be traversed by the cross-State line is substantially less than 14 inches.

Large areas classed as tillable in Lake County and Harney County which would be adapted to the raising of small grains if adequate moisture could be obtained are not and cannot be productive of crop to any dependable degree because the moisture required is not available either from rainfall or by irrigation. To render agricultural production reasonably certain in these central Oregon districts the land must be irrigated.

The greater part of the lands now classified as irrigated in this so-called central Oregon district fringing the desert produce less than a ton of low grade marsh hay to the acre. This scanty production results because the irrigation is not controlled and the water is not applied in proper volume and at the proper time. The practice is, generally, to flood the lands in the spring when the snows are melting and the streams are high and, by systems of canals and dykes, hold the water on the land for a considerable period of time,
1425 thoroughly saturating the soil. The result is a growth of natural hay which is consumed locally in the feeding of stock. (2648.) Grain crops and standard varieties of commercial hay cannot be produced under this system of irrigation. It is true that considerable areas in some of the districts mentioned are irrigated with a controlled water supply and grain, alfalfa and other hay crops are successfully raised.

If the railroad be constructed from Crane to Crescent Lake, it will serve the following irrigation districts:

The Harney Valley irrigation district, a State district in Harney County. This district extends from the north shore of Malheur Lake to the town of Burns in the northwest corner of Harney Valley;

The Blitzen reclamation district, which extends from the south shore of Malheur Lake, south up the valley of the Blitzen River;

The Silver Creek irrigation district, a State district on Silver Creek, Harney County, near Suntex;

The Fort Rock and Silver Lake districts in northern Lake County. In my estimation the Fort Rock district is impractical, and am not including it as a potential source of traffic.

The Harney Valley irrigation district was organized in 1919, and has a gross acreage of 83,000 acres and irrigable acreage of 75,000 acres. It is estimated that with the construction of a storage reservoir on Silvies River of 150,000 acre-feet capacity, they will have sufficient water to irrigate 77,000 acres, using duty of 1.4 acre-feet. (2649.)

The district has voted bonds in the sum of $2,200,000.00, none of which have been issued, and the water rights have been adjudicated in the district for 61,045 acres; this adjudication has been

appealed to the Supreme Court of Oregon and confirmed
1426 except in some few particulars left open for determination after further observation. One of these matters is the duty of water, which was placed temporarily at 3 acre-feet.

From run-off tables of the Silvies River, a copy of which is submitted—the table to which I refer is the one which you have covering the years from 1903 to 1925. It is taken from a report, as shown in the lower right-hand margin, by the Department of the Interior, United States Reclamation Service.

(Said table was thereupon received in evidence, marked "Defendants' Exhibit No. 49, Witness Buck.") (2650.)

From this report it is evident that there must be a considerable hold over some years, making it impracticable to use the entire reservoir capacity for irrigation every year, and with the seepage and evaporation losses, it is questionable as to whether they will have water for any more land than that adjudicated.

Of the 61,045 acres with adjudicated water rights, there are about 42,000 acres actually irrigated and producing crops of some kind, and of this amount 6,000 acres are in cultivated crops.

The soil survey of the valley, as shown in the report of John T. Whistler, U. S. Reclamation Service, and John H. Lewis, State engineer of Oregon, shows about 16,000 acres of yellowish sandy loam impregnated with alkali within the proposed district. This type of soil is of doubtful value agriculturally, and would require special treatment for several years, with no positive assurance that it can be successfully reclaimed.

The estimated cost to make the improvements necessary to irrigate the lands in this project is $67.00 per acre. This is from R. J. Newell's 1926 report, on page 53.

In addition to charges for interest on this sum and retirement of principal, cost of land, maintenance and operating expense, and taxes must be met.

1427 The population of the district now is about 200 people, and the railroad from Crane to Burns runs through it. (2651.)

In considering the crop production of this district the table now submitted shows what is reported to be raised in the valley, and also the average production per acre of Harney County, and the average yield per acre of all the irrigated land in Oregon, as given in the bulletin on irrigation for the State of Oregon, page 11, and bulletin on agriculture for the State of Oregon, page 22, as compiled by the 14th Census Bureau in 1920.

(Said table was thereupon received in evidence, marked "Defendants' Exhibit No. 50, Witness Buck.") (2652.)

[File endorsement omitted.]

1428 PORTLAND, OREGON, *August 17, 1928.*

GEORGE W. BUCK thereupon resumed the witness stand, and testified further as follows:

Direct examination—Contd.

At the State experiment station east of Burns, much larger crops are grown than shown in this table, and undoubtedly first-class farmers will grow much larger crops, but taking the average farmer in any of these central Oregon districts, situated as they are in such a high altitude, it is not reasonable to expect that they will produce on an average more than is produced on an average of all the irrigated lands in the State.

Practically none of the crops grown in this Harney district are shipped out but are fed to livestock and consumed locally. We understand that in 1927 there was a small movement of wheat by rail, amounting to 60,000 or 70,000 bushels, and that same moved to mills in the Snake River Valley in southern Idaho. In this district the Pacific Livestock Company owns about 33,000 acres, or more than one-half the acreage with adjudicated water rights, and the Wm. Hanley Company owns or controls about 13,000 acres more. (2653.)

With the construction and development, the taxes and annual charge per acre would necessitate making each acre productive, and this can only be done by actual settlers on ordinary farm units, therefore, we can safely assume that nothing will be done until they are certain that they can sell off their holdings to actual farmers, which at present is very doubtful.

The Blitzen River in Harney County flows into Malheur Lake from the South, and the valley of the Blitzen River and tributaries are part of the "P" ranch, owned by the Eastern Oregon
1429 Livestock Company. They have considered the building of a storage reservoir in the upper valley to irrigate about 34,000 acres; of this about 20,000 acres are now marsh hay and meadow, irrigated by flooding during the spring run-off, and about 2,200 acres are in cultivation, growing grain and alfalfa hay. The balance is good sagebrush land.

The company has built a drainage canal about 19 miles long, 10 feet deep and 20 feet wide on the bottom, and has also constructed some of the main canals and head gates. The completion of the project undoubtedly depends on obtaining farmers to buy and work the land.

From the run-off tables and size of the proposed reservoir it would appear that they have sufficient water for this amount of land with the proposed duty of 2 acre-feet.

The crops are similar to those grown in the Harney Valley district, and are for the most part fed to livestock. (2654.)

This land is from 22 to 40 miles from the railroad at Crane, over fair dirt roads, and will be from 8 to 26 miles from the proposed Crane-Crescent line at a point north of the narrows between Malheur and Harney Lakes.

The Silver Creek irrigation district was organized in 1918, and included about 18,000 acres. Of this about 16,000 is irrigable under the proposed storage reservoir; about 4,000 acres are at present irrigated by the natural flow of Silver Creek and flooding similar

to the system used in Harney Valley, and of this irrigated acreage about 800 acres are in cultivation.

Adjudication of the water rights has recently been made by the State engineer. This adjudication will undoubtedly be carried through the courts.

It is safe to say that this district will do no development work until the relative rights to the waters of Silver Creek are finally
1430 determined and a plan of colonization worked out.

Run-off tables available, as shown below, do not indicate that there is any water for more land than is in the district formed, using the estimated duty of 1½ acre feet, and if some of the larger of the claimants owning land beyond the boundaries of the district sustain their claims in the expected litigation, the project will probably be abandoned for lack of water to reclaim sufficient of the present (2655) non-irrigated land. The average acre feet for the three years described in the table was 22,099. The dictrict voted $600,000 bonds, the estimated charge per acre being $35, making a total charge for water alone about $5.40 per acre. None of the bonds have been issued, and there is no present prospect of issuance, and likewise no construction work has been done or is in immediate prospect. The climate and other conditions are similar to Harney Valley and the crop production per acre will be about the same. About 40 people live in the district now, and the crops grown are fed to livestock. The land is held at from $10 to $40 an acre, and is mostly first-class soil, but as is the case in the other (2656) districts discussed the land is largely in its virgin state and must be cleared of sagebrush, broken up, leveled for irrigation, cultivated and irrigated before it will produce revenue. The district is about 35 miles by good road from Burns. The proposed Crane-Crescent Lake line will be about 12 miles from the south side of the district. The Silver Lake irrigation district was organized in 1917, and in 1922 water was available for irrigation. They constructed a reservoir having a capacity of 18,500 acre feet, and built the head-works so that the dam may be raised to hold more water. The
1431 original district contained a gross acreage of 9,000 acres, of which 6,500 acres are classed as irrigable and 2,560 as irrigated. Because of failure to colonize and so distribute the financial burden, this district is heavily in debt, and most of the interest due on bonds since their issuance is owing either to the bondholders or the State. Only readjustment of its financial affairs and colonization can bring success. According to the 1924–26 eleventh biennial report of the State engineer to the governor, this district is burdened with outstanding bonds, bond interest due the State and warrants, to a total sum of $361,827.15. If the irrigated acreage amounts to only 2,000 acres, as (2657) reported by Mr. Struckland of the State engineer's office, then the debt per irrigated acre is $180.91; and assuming that there are 4,500 acres additional that can be irrigated, the total debt per irrigable acre is $55.66. The Summer Lake irrigation district was organized in 1918. It is located in about the

central part of Lake County, and contains an irrigable area of 4,941 acres. Its location is somewhat distant from the proposed cross-State line, and in reality the district is tributary to Lakeview and the Southern Pacific rather than to the proposed line. Bonds in the sum of $260,000.00 were issued in 1921, and the proceeds expended in construction, which was completed early in 1922. Several months later the dam failed and it became necessary to vote an additional $135,000 in bonds for repairs. Later the repairs were completed at a cost of $65,300 and operation was successful until recently, when the dam again began to leak. Of the 4,941 irrigable acres but 708 acres are being irrigated and cultivated up to January 1, 1927. The crops, altitude and other physical characteristics are similar to the Silver Lake district, though it is better sheltered
1432 from frost and wind. The misfortunes which have overtaken the district have resulted in a very heavy debt, and the State had advanced (2658) over $80,000 interest on district obligations. It seems highly probable that unless the bondholders take a loss and assist in refinancing the district and some extensive colonization effected that the district will fail completely.

According to the State engineer's report above referred to, the total bonded debt outstanding against this district, including the outstanding warrants, amounts to $415,053.67. This shows a debt per irrigable acre of $84.00 and a debt per irrigated acre of $572.10. Obviously with this debt burden settlement and cultivation of the lands in this district is not to be anticipated. As the Ontario-Burns line serves the Harney Valley, and the Burns line is nearly as accessible to the Blitzen Valley as the cross-State line will be, it therefore follows that the cross-State line as proposed can serve no additional irrigation districts except the Silver Creek Valley district and the Silver Lake district, and that these are from 8 to 30 miles distant from the proposed line.

This is the character of he location from an engineering standpoint and possible availability as a second main line for the Oregon-Washington Railroad & Navigation Company. As pointed out in opening my statement in this case, this line from Vale to Natron as surveyed and adopted is not appropriate under existing conditions. While I have no personal knowledge of the conditions that (2659) inspired the location of this line, I do know that at the time the work was progressing the Union Pacific and Southern Pacific were under the same management, and after this line was located and construction started, and before dissolution of the Union Pacific and Southern Pacific merger, I was engaged in surveying on the line from Eugene to Coos Bay and to Marshfield. I cannot believe that the line
1433 across the State would have been located upon the present survey, except as a through line reaching Portland and the coast by way of Eugene, with access to western Oregon industries, towns, and cities. Since the line was cut off from this access in western Oregon, the Oregon-Washington Company extended its line from Crane to a terminus at Burns, 25 miles northerly from the

cross-State line location. The maximum grade of the line from Ontario to Odell junction, as the same was surveyed, was eight-tenths of one per cent. The distance from Ontario on this cross-State line to Eugene and thence to Portland is 536 miles, whereas by way of the Great Northern extension south from Bend and the Bend line to Portland it is 599 miles. The distance from Portland to Ontario by way of the O.-W. R. & N. Company and the Oregon Short Line is 432 miles, the difference in mileage favoring the present O.-W. R. & N. main line route from Ontario to Portland by 167 miles. (2660.) Starting at Sherman, the junction point of the Des Chutes line with the main line of the O.-W. R. & N., and proceeding to Ontario by the O.-W. R. & N. the rise and fall is 9,990 feet. Starting from the same point and proceeding up the Deschutes to the Crane-Crescent Lake line and across the State to Ontario, the rise and the fall is 9,735 feet. The curvature, however, upon the present line from Sherman to Ontario aggregates 13,224 degrees, as compared with 25,446 degrees via the central Oregon lines to Ontario. From this it is evident that the proposed route is not attractive for the routing of through traffic as compared with the present line, because it is 167 miles longer and presents 12,222 degrees more of curvature. I have estimated the cost of this line, at present day prices, upon the surveyed location which I have been discussing, to be as follows: From Crane to Crescent, the distance, 185 miles, the cost to be $11,056,327 or an average cost per mile of $59,764. Detailed estimate is prepared on that.

1434 (The detailed statement was received in evidence, marked "defendants' Exhibit No. 51, Witness Buck.") (2662.)

The cost of the operating equipment required for this line at present prices is estimated at $661,350, the last sheet of Exhibit 51 reflecting the equipment. Total cost of construction and equipment, $11,717,677.

(Map of the roads and railroads was received in evidence, marked "defendants' Exhibit No. 52, Witness Buck.") (2662.)

Cross-examination:

The general survey or analysis of the railroad and traffic situation I have given was partly taken from my testimony in the former case and last year I went over and revised it up to date, and went over the country out there. I made a trip into that district and checked my figures and rechecked the costs and prices to adjust them to conditions as they are at present. Exhibit 48, a map, was prepared again, with slight changes, as I recollect, of the former exhibit. Exhibit 48 shows the lines that were run and completed in 1907, as far as the Odell junction. The line from Odell junction to Natron was changed by the Southern Pacific since that time. I was actively in charge of the survey between Ontario and Odell. I did not make any analysis of the traffic possibilities to the extent of making any reports, merely my observation of the country as I went through. Therefore, I have not available a traffic study. I know of no one

who has made such a study. (2664.) The principal source of traffic that was expected to support that original project, as I understood it, was to be a transcontinental line through to the coast. That is why we were locating such a high-class line. If it had been a branch line we would not have endeavored to maintain an eighth-tenths maximum grade across the State with a light curvature. Now in our cost of construction, Exhibit No. 51, we have not varied the character of construction proposed.

1435 The line from Ontario to Crane was not put in according to plan, that is original plan. Construction was considerably cheapened, and the grade up the Malheur Canyon into the Harney Valley was increased to one per cent. Originally it was eight-tenths. (2665.) If the type of line set out in our original Exhibit 51 were constructed, it would be on a substantially better standard than that of the existing line from Ontario to Crane.

Q. From the standpoint of practical railroad operation would it be fair to assume that upon the construction of the cross-State section it would be expected that the Malheur Canyon section from Crane to Ontario would be brought up to a similar standard?

A. Well, if the traffic warranted it. If there was sufficient traffic they would probably increase the standard or improve the standard of the line in the Malheur Canyon by adding more ballast. I can't tell you what weight of rail is used in the Malheur Canyon. (2666.) I have an idea it is about 85-pound rail.

Q. Other than adding some additional ballast, then, nothing further would be required to bring the Malheur line up to standard with what you have proposed in your Exhibit 51?

A. I think you will have to ask that question of one of the later witnesses, who is more familiar with that line. We are not operating that line here, and I haven't been connected with the railroad for several years.

Exam. ROGERS. Well, as it was originally put in what would the answer be?

A. Well, as originally put in of course it would have to be improved; but, as I say, I am not familiar with how it has been improved since it was originally built.

To bring it up from the original construction to the construction which Exhibit 51 shows, it would require some more ballast. If the rails are less than 90 pounds, there would be that difference,

1436 and a question of the number of tie plates per mile that are on the present line as compared with this. Those would be about the three things that would apply from what it was as it was laid out originally.

Exam. ROGERS. What is the difference in the construction that you figured on in your Exhibit 51 and the present (2667) main-line construction on the Columbia River line?

A. Well, the Columbia River line is ballasted more with crushed rock. This country up here would use a ballast of gravel, and I

understand lighter construction using heavier steel than this line uses. We are planning here for 90-pound steel. Newer construction contemplates 110-pound steel in most cases of the main line.

It is a question as to which makes the best ballast. Some gravel ballast is very fine. But over here we used crushed rock more on account of the moisture, the climate of western Oregon. By "over here" I mean west of the Cascades. Part of the main line of the U. P. is gravel ballasted. Most of it is Sherman Hill gravel which is a disintegrated granite, about the finest ballast in the world. I don't think the Malheur Canyon line was built up to main-line standard. I don't know whether it was expected to be used as a main line at the time of construction. (2668.) As to what you are to understand from my testimony as to the plan the carriers had in mind when it was built, I am stating as to when it was located. I didn't have anything to do with the construction of the main line. That was handled entirely outside of my department. I was strictly a locating engineer at that time. But from the standpoint of the location and the plan to go through to the coast, it is reasonable to assume that it was constructed with the intent to use it as a part of the main line. As far as the alignment was concerned there could be practically no change. As to the width of the cuts and fills it is my recollection that it was built about two to four feet narrower on the roadbed than standard Union Pacific construction for main line.

In compiling Exhibit 51, the estimate was made from the
1437 original profiles that were made in the field in 1905, '06, and '07, and the quantities figured at that time for that type of location. From my knowledge of the situation now (2669), I believe that I have used a fair basis or type of construction for consideration in this case. I don't see how this line through that territory could be cheapened much, unless we built it on a steeper grade. As to my suggestion on this particular line, if we were building it under any conditions now to exist, as far as I can see, it certainly would be built as cheaply as possible. But I would consider it merely as a branch line, with any doubtful earning capacity, and we would want to get it there with the least expense possible.

Q. Do I understand you to say you would consider it as a branch line, and yet you have asked the commission here to take into consideration in arriving at its costs full main-line construction standards?

A. That is immaterial as far as my opinion is concerned. I am making an estimate on the survey of the proposed line.

Comr. McManamy. If it were built in accordance with the standard of an ordinary branch line, could you give an estimate as to the percentage your figures would be reduced approximately, or would you care to?

A. That would be very difficult to do. I am not really familiar with whether on the branch lines to-day they use lighter steel (2671) than they used to in years gone by. We used to use a second-hand steel when I was in the railroad construction, but my understanding

now is that there is practically no second-hand steel available and that they are using, in nearly all cases, this 90-pound new steel, even on new branch-line construction. As far as grading is concerned,
1438 there could probably be a little difference by increasing the grade to 1.25 per cent on portions of the line and a little narrower roadbed would save some percentage. Naturally you could figure that. Anybody would understand that. I doubt if it would be 10 per cent. Say nearer five. In my estimate I have made provision for terminal facilities at or near Crescent. Figuring on estimate of shop, small; two-stall engine house, at a point half way between Crane and Crescent, and one at Crescent; and coaling station, a small coaling station there and a small coal dock; a heating plant and cinder pits; small shop building, oil and store house, sand house and dryer and a foreman's office and locker. This is on page 4 of the estimate. I have noted two or three each (2671) at different points there. Of course there would only be one of each of those at the Crescent terminus. One is to be located approximately half way across the line; we estimated there for the intermediate division. The length of our divisions under this plan would be about 90 or 95 miles. It is a little short, not for the freight division. You could not make one division out of the whole distance. As to comparison of Exhibit 41 with the one previously made in the earlier cross-State case, this has been varied considerably as to these features, and the tracklaying to some extent, in that the conditions have changed since that other estimate was made with reference to those things, and the estimate of operation by the operating department changed the necessity for the number of buildings and improvements we had planned in the former situation. I was out over the route of the proposed line last fall. (2672.)

Q. What facts did you find that you did not have before you at the previous hearing, that caused you to make these substantial changes?

A. Well, they were not made by me; it was by the operating
1439 department and given to me to change my estimate to fit with their estimate now of what they considered was necessary for the operation of the line.

As to the principal changes given by the operating department, it is my recollection there was not as large terminal facilities, or in buildings, there was a difference in the number of depots they estimated. As to the location of the passenger depots, they would have to be located at approximately every other siding along the route, according to their estimate. A place for the operator to live (2673) and build it as a combination passenger depot and living quarters for the operator and agent. (2674.) They would be located approximately 25 to 28 miles apart. I think they estimated on this construction their sidings about 14 miles apart. I think the former estimated length of siding was 3,600 feet. It has not been changed. These sidings are for passing tracks and loading purposes. In some places where the depots were there would be

house tracks built to the depot in addition to the siding. A 3,600-siding would accommodate about 80 cars.

Q. Using 3,600-foot sidings, spaced at intervals of fourteen miles, will permit you to handle very heavy traffic, would it not?

A. Well, I don't think I would be able to answer that. We usually build them six miles apart on main lines. I have never had anything to do with the operating (2675) end of the railroads. You could operate a good many heavy trains over a line so constructed. Since the line passes through no towns between Crane and Crescent, as to whether these six passenger depots would be justified, they would not be justified as passenger depots alone but as a combination building. There would be a waiting room. For $5,000, you are not building much of a depot and house. I contemplated an agent should be stationed at each of them. I intended to fence all of the right of way. (2676.) The area through which we would pass is a grazing country. There is stock running on the range all
1440 the time, in the spring and fall and some in the winter.

All the way over the Wagontire Mountain divide, and after you leave the Fort Rock country into the Crescent Lake country there would be solid rock encountered there in the deeper cuts. I included some more solid rock excavation in this Exhibit 51 than I did in the previous estimate, but the previous estimate did not include the line from Odell to Crescent Lake. I think this is solid rock I have added between those two places.

Q. In preparing Exhibit 3, the large map which purports to show the area which would be served by the cross-State line, what factor did you take into consideration in outlining the area which you have enclosed in the heavy brown line?

A. Well, we figured that approximately twenty miles each side (2677) of a line would be the territory served by it.

Q. Are we to understand from that in your opinion a line of railroad more than twenty miles distant from a producer or a given community will furnish it no service?

A. No; of course if there was no other railroad in the country for a long ways, why, it would take in more country, but on an average for economic haul to a railroad of farm products I would consider twenty miles about as far as a person would want to haul staple crops. I believe Alkali Lake is over 65 or 75 miles from its nearest railroad transportation to the south.

Q. Well, why should the dividing line of that territory be twenty miles from the cross-State line and sixty-five miles from the nearest transportation to the south of there?

A. Well, there is nothing in south of that line that needs any railroad service within that distance that would stand for an economic haul. It would be immaterial if we run that line down there another 10 or 20 miles south.

Q. Well, wouldn't it be more fair, Mr. Buck, to place that
1441 line half way between the nearest transportation to the south and the (2678) cross-State line?

Mr. SPENCER. It isn't a question of what would be fair—as I remember the interrogatories of the commission—I may be in error in that regard—that asked for conditions on 20 miles of either side of the line. I think that is the reason for this. It isn't a question of fairness.

Mr. ELLIS. Well, with the understanding that this is not the witness' idea of the territory that would be served, I would have no objection to dropping the question, but I had understood that that was his idea of the area that would be served by this line. If that is not the case, why, my questions are unnecessary.

Q. (By Mr. ELLIS.) Is that true, Mr. Buck? Did you not intend to tell the commission that the area enclosed in brown was the area, and the only area, that would be benefitted by the cross-State line?

A. No; I wouldn't say that. When this 25-mile area was laid off, I do have a faint recollection now that that was the original questionnaire when this map was made. That is the only reason we have made it this way.

Q. In your opinion, Mr. Buck, would traffic move to this line (2679), the cross-State line, from territory substantially more than twenty miles distant?

A. It will all depend on what the traffic was.

Q. Well, the grain, hay, and livestock traffic, such as is generally produced throughout the eastern and central Oregon territory, would that move more than 20 miles to a railroad.

A. Livestock might, but I doubt if anything else.

I am satisfied hay wouldn't move more than 20 miles to a
1442 railroad. Couldn't afford to haul it that far. If grain were raised in that territory, it might be hauled. There are no vegetables and fruit there to haul. There are vegetables and fruit along the shores of Summer Lake but they have to go over a pretty high mountain to get to this line. You can haul vegetables and fruit any distance you want to—the question is whether they would arrive ready for market, or in any condition (2680) to sell or to use.

Q. (By Mr. ELLIS.) Then is it fair to assume from your testimony, Mr. Buck, that the entire area of eastern Oregon, beginning at a point twenty miles southerly from the tips of the branch lines of the Oregon-Washington Railroad & Navigation Company extending south to a point 20 miles north of Lakeview and west to a point 20 miles east of the north and south line from Bend to Klamath and 20 miles west from Crane, is not served in any manner by railroad transportation at the present time?

A. I would consider it wasn't, except as to livestock. The divide is practically half way between the western border of the heavy brown circle area on Exhibit 3 and the Deschutes River, or the old Odell, and lies to the south. About mile post 180 would be the ridge of the Walker Range.

Q. You wouldn't expect that traffic from the Fort Rock area could move economically by truck haul or similar means of trans-

portation over the Walker Range to the present line north and south from Bend to Klamath, would you? (2681.)

A. Well, under ordinary conditions, no. I don't know what the economics of truck haul is to-day, it is being developed so rapidly. I think I testified that the area in the Harney Valley would not be directly served by the proposed cross-State line, because it was now tributary to the Crane-Burns line, recently constructed. I couldn't say where traffic moving from that territory finds its markets.

1443 Q. Do I understand that you have not intended in your testimony to pose as an authority on whether existing transportation facilities were sufficient to take the products of the country to their logical market?

A. Why, they have a rail line extended through their district on which they can ship their products. It may not be the shortest line to the point where they want to ship them. If the principal markets for the products of Harney Valley were west, the cross-State line would (2682) give them a shorter distance to the market.

As to the difficulties being encountered in the numerous irrigation projects in central and eastern Oregon, financial difficulties and colonization are not entirely the principal objections. The amount of available water is questionable and in most districts there is a question of soil, whether it is good soil or not for farming and as I stated before, in the Silver Creek and Harney Valleys there has always been a dispute as to the water rights; and the large ownerships of land, I think, would have considerable effect on whether or not they would surrender their lands at a reasonable figure so that they could be colonized. Those large land holders are offering their land for sale in small quantities at present. (2683.) The transportation question is very important in the colonization problem. Personally I should say colonization will not be at all practical until transportation is provided.

I have been through the Yakima Valley in Washington. As far as I recollect in that development and other irrigation districts developed in the western territory, it was the usual procedure to find the transportation first and the colonization afterwards. It is my understanding that the entire area enclosed within the dashed brown line on Exhibit 3, beginning at mile post 50 and extending to mile post 160, is a desert and one which can not be made productive. I am not aware that throughout that area there are at the present time settlers who are producing crops. I have not seen them. (2684.)

1444 I am familiar with the Wagontire section.

Q. Well, there are settlers there who have been farming that land and running livestock on the range ever since this cross-State line was originally projected, are there not?

A. Yes; and 20 or 30 years before, but the area is absolutely insignificant of the amount of land under cultivation. The Huttons have two shoestring ranches on the south side of Wagontire Moun-

tain. There is a small stream flows down the gulch, and they have cleared a little each side of the gulch for quite a distance down, and have always raised some crops there. The Egleys have some land around on the east side, but the last time I was through there it was apparently abandoned, very little done. There are two or three very small places up in some of the gulches trying to raise a little hay and grain. There was quite a ranch on the north side of the mountain called Crooked Creek; nothing in cultivation there, though there was quite a large spring there at that time. Of course, they all run stock. That was their main business. (2685.) With existing transportation facilities and a limit of approximately a 20-mile haul on grain, I wouldn't expect them to produce anything except stock.

Q. And is it not a fact that they are raising all of the grain and hay that they can make use of in connection with their livestock operations?

A. Well, that is an ambiguous question, also. I don't know how much stock they are running now. Some ranchers feed practically nothing in the winter, and others take good care of their stock and feed large quantities of hay. I think they weren't raising any more hay than they should raise at that time with the land they had and the amount of water they had. I purchased hay there from Hutton, but he refused to let me have it unless I would replace it in the spring, if needed.

1445 Q. Is it not a fact that there were a great many more settlers, homesteaders, throughout that area around Iron Mountain and Wagontire, at the time you made this original survey and shortly thereafter? (2686.)

A. Not at that time there weren't. They came in afterwards, when the rush went in for these dry-farm homesteads. One of my teamsters who was raised over in that country took a homestead in below Hutton's ranch there, on the side hill. It was fine-looking land, but he finally gave it up. He couldn't get any water. Brought in a power drill and drilled over three hundred feet and didn't get any water and finally gave up; lost everything he had there. Further west into the Christmas Lake country and east down in the Harney district, you can get water at the depth of from 20 to 25 feet. The rush occurred about 1910; that was about the same time the construction of the line from the east end was projected. When the settlers left, I don't know whether (2687) it was the loss of hope of railroad transportation or whether they found they couldn't raise any crops. Of course it wouldn't have done them any good to raise crops if they couldn't ship them out.

Q. Now, on the west end of this high desert and nonproductive area, as you have termed it, you have included the entire area of the Christmas Lake Valley and a great deal of the area known as the Fort Rock Valley, and which you have marked on your map "Proposed Fort Rock irrigation district," have you not?

A. Well, that proposed Fort Rock irrigation district is the title for the irrigation district, which is colored, west of that line. The blue, hatched area is the proposed Fort Rock irrigation district. (2688.) The area east of the blue area and between the Fort Rock irrigation district and Christmas Lake Valley is not of a fertile nature in my estimation. In my judgment, that was some of the poorest-looking land in central Oregon. There is very little there that has been actually homesteaded and dry-farmed. Considerable of it has been homesteaded.

1446 I think the Ernst ranch was a few miles to the west and south of Fort Rock. I would say that there is good soil in that district there.

Q. I think you are mistaken as to the location of Ernst ranch. I am sure it is east of Fort Rock. Are there any grazing possibilities at all within this area that you say is non-productive?

A. Yes; there is a regular bunchgrass desert country; the sagebrush growth with a small amount of bunchgrass around the sagebrush. (2689.) I did not intend to convey that it was absolutely useless. Non-productive as to the growth of agricultural crops is what I meant. It is a grazing country that can be used part of the year.

As to rail locations I have made: I have located in Nebraska and South Dakota for the Chicago & Northwestern; in Iowa for the Milwaukee Road; in Utah for the Utah Copper Company; in Canada for the Canadian Pacific; and I located on the Topeka Northwestern Railroad for the Union Pacific Company in the double tracking of the Union Pacific of their main lines in the Kansas division. For the Northwestern, I located the Verdigris branch from Bonesteel, S. Dak. The end of the old branch was off the main line at Norfolk junction. The line was about 40 miles. (2690.) For the Canadian Pacific I located on that south main line from the Okanogan Summit to Penpicton, and I built that section, 57 miles; and I located part of their lines up the Similikameen River.

As to the snow conditions one year along the route of the cross-State line, we had from 12 to 14 inches of snow practically all winter. The next winter we had hardly any snow.

As to any new construction that was no more attractive than the country across Oregon, I imagine the line (2692) all the way through Idaho, when it was originally built, was through a country as nonproductive as this. I have never been over the line from Ogden down to Los Angeles. I am not familiar with that territory.

1447 In Exhibit 51, first item, 5 per cent of nine million dollars, the nine million is the cost of all the items added together and then the 5 per cent is taken of those and put to the head of the column (2692) and added to the total, then, makes your total cost.

Q. All of what items?

A. All of the detailed items in the estimate on that point.

Q. Well, would it take through item 74?

A. Take to item 74. It does not include the 10 per cent of the interest.

I don't think there is much difference in the unit costs now than at the time I made my previous estimate in the previous case in 1924. There have been some contracts let at a little greater figure than they were at that time, and especially in classification. I think materials would be a shade lower than in 1924.

The allowance of $37,000 for law, on page 5, is a standard set-up of a certain percentage; according to the costs that have been proven in the past, legal expenses averaged about that per mile.

I think the total rise and curvature via Portland from Eugene to Ontario would be about the same as via Crane. As to the status of the right of way across there, I think it has been relinquished to the Government on this cross-State line from Harriman west, in its entirety. (2694.)

Exam. ROGERS. They originally had some option on it, some hold on it, didn't they? I just recall, Mr. Spencer, at the time this case was argued before, there was some discussion between one of the commissioners and Mr. Dey about this right of way.

Mr. SPENCER. I think Commissioner Aitchison asked me that question in the argument, but the Government right of way was all that the railroad company had across there beyond Crane, and it was relinquished to the Government, on a show cause called
1448 for by the Government, I think, oh, probably a year and a half ago.

Exam. ROGERS. Well, can it properly be said now that the carrier has no right of way between Crane and Crescent Lake?

Mr. SPENCER. That is correct. Well, this line that goes to Burns proceeds westerly five or six miles. We have got that. We haven't any right of way west of the Burns branch. That is the Oregon Washington Railroad and Navigation Company hasn't. (2695.) The route that follows the survey and location made in 1906 and '07 between Natron and Vale and now the uncompleted portion of it between Crane and Crescent Lake is a feasible and practicable route from an engineering and cost standpoint for a line of railroad. There could be no further development in that section without a railroad, agriculturally. It was the Oregon Eastern Railway Company that was organized to build this line across the State in 1905. I think its capital stock was owned by the O. R. & N. I don't think the Oregon Eastern Railway Company is still in existence. (2696.) I believe they were building on both ends of the proposed route. They started at the east, and shortly after I started my locations, and when I got across to Eugene they had the line built to Natron there the following year.

1449 Q. You said, Mr. Buck, that the cross-State line could not possibly pay its operating expenses, not to mention interest on investment and fixed charges. Do you know, or have you made, any calculation of what its operating expenses would be?

A. No; I did not in this estimate. I did in the other case, I think. The operating expenses were furnished by the general superintendent of the O. R. & N. as estimated from the traffic that was estimated to be allocated to the line.

Q. Your opinion, then, in making that statement, was not based on any investigation or study or ascertainment of facts that you yourself made? (2697.)

A. No; not as to anything but my judgment of the traffic available in the territory traversed by the line.

1450 Greasewood is a brush of stubby growth, very little foilage and prickly, and indicates the presence of alkali. The leaves are heavy and drop off and lie on the ground. I never saw any animals eating them.

Q. Now I understand you to say that there were so many projects in the Northwest with water available and railroads already there, that this cross-State line ought not to be built while the others are undeveloped. Did you say substantially that? (2698.)

A. No; I said—I did not consider that these projects would be settled by colonies when there were so many other projects with sufficient water that were served by railroads, with land available for colonization. In my opinion there was no opportunity for colonization in the area tributary to the cross-State line, in view of the lands available in other irrigation projects in the Northwest where transportation was available. That circumstance would not affect my judgment as to whether the cross-State line ought to be built. The other projects that I had in mind in the Northwest are around Bend and Redmond that have rail transportation and ample water and good soil; projects over in eastern Oregon, located between Umatilla and Pendleton on the main line of the O. R. & N. have ample water; and then there are several projects in Idaho all the way up the Snake River on the main line of the Oregon Short Line and its branches.

Q. What traffic was it that was contemplated would move over the Oregon Eastern Railway's line when it was built across the State?

A. I wasn't the one that developed that point at all. I was (2699) ordered to make the survey across the State. As to what traffic there was there I was not informed, or what was anticipated.

Q. I thought perhaps you knew. You testified what the purpose of building the line was and I thought you might have known.

A. That was my judgment, from the fact of the type of line I was ordered to locate and the fact that it was to go all the way across the State.

1451 When this line of the Oregon Eastern Railway was surveyed and the project partly built on the east end and west end, the present line of the O.-W. R. & N. from Portland to Ontario along the Columbia River and through Huntington was built and in operation. At that time in 1905 the Southern Pacific Company's lines in western Oregon down to Roseville, Calif., and the line of

the Central Pacific from that point east to Ogden were built and in operation. (2700.)

I would think in 1905 when the route of the Oregon Eastern Railway was surveyed, it was anticipated that traffic to and from western Oregon, commencing at Portland on the north and going down to the Oregon-California State line, from and to Granger, Wyo., on the east, would move when this Oregon Eastern Railway line was completed, partly by Ontario and the cross-State line into the valley, and partly through Ogden, Roseville, Calif., and then north into the valley. At the time this survey of the Oregon Eastern Railway was made in 1905, '06, and '07, in my judgment as a civil engineer, with a great deal of experience in railroad employment and locating lines of railroad, I would think the building and operation of this cross-State line along the route of the Oregon Eastern Railway would have been justified from the standpoint of economy and efficiency of operation, keeping in mind that the Union Pacific and Southern Pacific systems were then merged and in one common control. (2701.) I think when they were all merged in one system, that that line would have been justified for handling traffic from Eugene and south to the East.

Exam. ROGERS. Mr. Buck, if the line could have been justified at the time it was originally put across there to handle this eastbound traffic from western Oregon, that justification would be increased now, if the system, as you say, were merged as before, would it not, due to increased traffic, or would it?

A. Well, I don't know whether the traffic has increased on the O. R. & N. recently, so that there is a necessity of another line
1452 to the (2702) East. At the time I was employed by the O. R. & N. previously I know traffic had decreased considerably to what it had been prior to that time, so that there was no necessity for another line to relieve any congestion on the O. R. & N. The saving of distance on this line would have amounted to something on short-time freight, but as far as my understanding of the operation of the movement of the other types of freight, a few hundred miles difference does not really make very much difference. Where the line was to cross there originally, it would have taken some traffic from the O. R. & N. If it took it in the vicinity of Eugene and north or south from Eugene, of course it would have taken some from the O. R. & N. traffic main line. The O. R. & N. never handled the maximum tonnage that could be handled over the main line. I have no information (2703) how this traffic to and from western Oregon preponderatingly moved at the time the Union Pacific and Southern Pacific were merged into one system; that is via what gateway.

Q. Now if the Union Pacific and Southern Pacific lines now constituted one system, would you say that the same justification existed at the present time for the construction of this line across the State from Crane to Crescent Lake as existed for that project back in 1905 and 1906?

A. At that time the contemplated line from Klamath Falls to Alturas was not in contemplation, according to any information I had. That might make some difference in the justification of this line here, though there is no doubt if the systems were united that this would give a shorter route to the East for part of the territory served both by the Southern Pacific, or practically by the Southern Pacific now. It is a matter of opinion but I would say if the two systems were merged, they would close up this gap (2704), and not leave those stub ends out there as they are now.

1453 The line to Alturas, southeasterly to Klamath Falls, is only 17 or 18 miles altogether before it gets out of the State of Oregon and would not afford to the undeveloped portions of the State that are now without rail transportation a substitute for the construction of the line from Crane to Crescent Lake.

Q. (By Mr. McCulloch.) Mr. Buck, suppose that at the present time although the Union Pacific and Southern Pacific systems are not operated under a single control, that compulsory interchange arrangements respecting the traffic to and from western Oregon from and to Granger, Wyo., and points east, should be made by the Interstate Commerce Commission, or a substantial part of the western Oregon tonnage, by reason of routing instructions given by shippers of that tonnage, could be insured for movement over this cross-State line between Crane and Crescent Lake to the extent, at least, of the amount of tonnage that it was contemplated would move over (2705) it back in 1905 and 1906 and '07, in your judgment would the justification at the present time, under such circumstances, for the building of this cross-State line be as strong as it was back in 1906 and '07?

Mr. Spencer. We object to that inquiry and question, because it assumes a premise without any facts in the record upon which to form a conclusion. It is involved in speculation and conjecture, and there is no warrant or showing by this witness that he can estimate or conceive as to what the shippers in western Oregon would do with respect to the giving of routing instructions.

Comr. McManamy. If the witness can't answer he can say so, but he has an opinion with respect to that I would be glad to have it. (2706.)

1454 A. If the traffic was ordered to be routed that way, as I stated in my former answer to one of his questions, it would be a little shorter line to the East, but I can't see the necessity of duplicating railroad construction, when the O. R. & N. already can handle all of this business if given to them at Portland. When I made the statement that if the lines were merged, it would close up this gap, it would be my opinion that it would close up their ends.

Q. (By Mr. McCulloch.) All my question contemplated was this, if by reason of compulsory interchange arrangements, or by reason of traffic routed by the shippers, as they have a right under the law to do, the same flow of traffic across this cross-State line were insured as was in contemplation by the Union Pacific and Southern Pacific

systems back in 1905 and 1906 and '07, would the justification for the building of this line be any less strong than it was then?

Mr. SPENCER. We object to that question upon the same grounds. There isn't any comparison between the situation of a railroad when it goes into and controls a territory as compared with the situation when it has to depend upon the mind and disposition of the shipper to route it one of several ways. Furthermore, the record shows a very great change in (2707) conditions between those dates, and this witness doesn't pose here as a traffic man in respect to present years, to say the least. He testified he hadn't been connected with railroad operation for several years.

Comr. MCMANAMY. The same ruling will apply.

A. I will make no statement as to that, as to my opinion.

By my statement that two or three hundred miles difference in distance wouldn't be material I meant to state that when I was in the railroad service traffic was routed around various ways regardless of distance involved. There seemed to be some arrangement between railroads for division of freight that controlled the routing of
1455 freight and it didn't always move by the shortest route between points.

I have had occasion to locate cut-offs and other similar improvements to shorten distance. I had nothing to do with Umatilla cut-off; it was done at the time I was with the O. R. & N., but I personally didn't have charge of that. (2708.) Grades, I think, were of more importance than distance. I did not have anything to do with the Lucin cut-off, on the Central Pacific. Substantial expenditure was made there for a 35-mile difference of distance. There is a pretty general rule or practice with respect to the investment which will be made for the purpose of improving grades and shortening distances; I couldn't give you the formulas that we used. I think in general this describes it—that if an improvement of that character will pay the carrying charges that it is looked on with favor.

Speaking of temperature on the high desert and the cold mornings, I simply intended that to apply to its effect upon agriculture and not upon railroad operations. (2709.)

Comr. MCMANAMY. The temperature there seems to be very much lower than the temperature of other places similarly located and of the same altitude. Do you have any thoughts as to the cause of that?

A. No; I do not. I do not know what causes that. I know I had a ranch down in southern Idaho at a higher altitude than this, where we matured crops that were of a much more delicate nature than you could possibly grow here, even up to apples and pears and such fruit. It is very cold out there all across that interior.

Comr. MCMANAMY. I had in mind such places as Pocatello, at 4,500 feet, and Bancroft, at about 5,000 feet, and American Falls.

1456 A. I have never been around Pocatello very much. I was around Twin Falls country and Gooding, where my place

was. Well, the Goose Lake country is still higher and much more favorable climate. The elevation of Goose Lake Valley is 4,700.

Comr. McMANAMY. Well, your experience out there didn't give you any thoughts as to the cause of it?

A. No.

Comr. McMANAMY. Now the question of snow at Crescent Lake, are there any snow sheds on the Natron cut-off? (2710.)

A. I don't believe so. I haven't ridden over the Natron cut-off, and I wouldn't be able to say, but when I went across first with my survey from the East I arrived at that summit on the 6th of June, and the snow was over five feet deep then. We had to stop. We couldn't get through. We had to wait until the snow melted before we could move our equipment over onto the west side of the divide.

Comr. McMANAMY. Is that not true of any line that crosses the Cascades at an altitude of four thousand feet or better?

A. It is.

Comr. McMANAMY. Are you familiar with the line over the Cascades on the Southern Pacific?

A. I only went over there in the night. I am not familiar with that.

Comr. McMANAMY. Not familiar with the altitude or the snow conditions of Truckee?

A. No, sir.

Comr. McMANAMY. Of Blue Canyon?

A. No.

Comr. McMANAMY. What is the altitude of Crescent Lake?

A. 4,800 or 4,900—4,860, I think.

Exam. ROGERS. Mr. Buck, do you know of any so-called cut-off that has been constructed in recent years that could have
1457 been justified if a distance of three hundred or four hundred miles didn't make any difference?

A. No.

1458 I. L. PATTERSON was thereupon produced as a witness on behalf of complainants and, having been first duly sworn, testified as follows:

Direct examination:

I have been Governor of the State of Oregon for two years. I have been a resident of the State of Oregon all my life. I was born in Benton County. I think my family moved to Polk County when I was about eight or nine years of age. I (2712) lived there until I was 19 years of age. Then I have lived in Salem most of the time since that. I spent four years in Portland, and for the last 12 years I have lived in Polk County.

In private life my occupation is at present a farmer. My farm is located five miles west of Salem. It is a diversified farm. I produce a great many things commercially, hops and fruits, some livestock.

As to what extent during my residence in the State of Oregon I have become familiar with the State, its resources and its transportation problems, well, I ought to be fairly conversant. Perhaps less conversant with its transportation problems than the other things, but I should know something about all of it.

Prior to becoming governor I served as State senator for eight years. I have held one position with the Federal Government; (2713). I was collector of customs in this district from August, 1898, to January, 1907.

Q. Now, governor, I am wondering if you could tell the commission something of the early history of the State of Oregon and its development, in so far as it has been affected by transportation or lack of transportation?

A. Well, of course, in my early recollection of Oregon there was no railroad transportation at all. We were a new country.
1459 And when transportation came the country began to grow. I might cite the Rogue River Valley, for instance. Without railroad transportation that valley to-day no doubt would be, as it was at that time, a small stock country, growing things that they could drive out. The same is true of other parts of Oregon.

Q. How has that condition been affected by railroad transportation?

A. It has given an opportunity to develop the country and produce things that we ship out of the country, which would have been impossible otherwise.

Q. What is the situation in Oregon at the present time, as you find it, as you know it, as to the adequacy of railroad transportation facilities?

A. Well, I don't know just what you mean. Do you want to know if there is enough railroad transportation to carry our (2714) products out of the country?

Q. That is the question I had in mind.

A. Well, yes; there is enough transportation to carry our products out of the country. We have no trouble at this time, haven't had for some time. One time I had some trouble with car shortage, personally.

Respecting the facts as to whether or not the State is adequately served at the present time with railroad transportation facilities, I feel, I think in common with a great many people, that the facilities could be very much improved by a cross-State railroad line.

I have in mind in that the shipment of fruits and vegetables
1460 that could be much better shipped and more profitably grown if the time for transporting to the market were shorter. I am unable to answer the question as to what extent the production of perishable products, such as I mentioned, has been retarded by a lack of short routes to markets, except to say that when you ship fruits or vegetables the length of time on the road, as anyone knows, is an important factor. I have no personal experience in that, but

I have been told that in the matter of vegetables that a day or two longer they deteriorate and wouldn't reach the market in the same condition as if there was a shorter time. The same thing is true as to fruit. (2715.)

Q. Taking Eugene, as an example, where the distance by the cross-State line will be shortened approximately 420 miles as compared with the existing route through Roseville, from your knowledge of the conditions surrounding the production of fresh fruits and vegetables would that shortening in distance be of any material benefit?

A. I thing it would be of very great material benefit.

Q. Would that shortening of distance be of any material benefit in connection with other natural resources of western Oregon?

A. Well, I would think it would. Naturally, I have been more or less in commercial business, and I have done a good deal of shipping—time is an important factor in shipping products of any kind, whether it is merchandise or farm products.

Q. Have you had occasion to make any comparison of the development of the State of Oregon as compared with the States of Washington and California, or to consider how that de-
1461 velopment may have been affected by railroad transportation??

A. Well, there isn't any question, every one knows that our development here has been much slower than that of either California or Washington, and I think, in common with most people, that lack of adequate transportation facilities has had a good deal to do with that. I might illustrate, if I may, with reference to our State road-building program. Within the last 12 years we have spent more than a hundred (2716) million dollars in building roads, that is, State roads. The counties have built lateral roads with the assistance of the State, and market roads, and anybody in Oregon knows what that has meant to Oregon, the advancement that we have had from our road building in the State of Oregon. I can't help but liken that to railroad construction and railroad building.

The principal portion of Oregon's highway construction has been within the last 10 years. I think that railroad construction within the State has not kept pace with the highway construction which has been carried on by the State.

Q. From the standpoint of functioning of the State government how is the situation affected by transportation or lack of transportation?

A. Well, of course, there is no question but that the easier (2717) the people of the State can reach the State capital—I don't know that I could say the State departments would function any better, but it would certainly be a great benefit to the people living at a distance from the capital. I think it would enable them to better utilize the facilities of the State government than they do at the present time.

1462 I stated that I produce some fruit; the kinds of fruit I raise are loganberries, peaches, cherries, apples. As to

whether I find any difficulty in the production of those fruits, I think anybody anywhere will find some difficulty in the production of fruits. Sometimes you have frosts, and other times you have rains, and various elements that you have to combat. But these fruits I have mentioned may be produced successfully in a commercial way here in the Willamette Valley; they can be and are being grown successfully.

I have the same difficulty in producing apples that they have in every apple-growing district, no matter where it is. We have (2718) anthracnose; we have it every year. We have the codling moth, we have apple scab, and we have various things. In fact, we have the same things that they have elsewhere. I am able to counteract the effect of those things and produce a good commercial product. With me it is a matter of spraying and taking care of the fruit. If you do that you produce your fruit. I think I grow the finest Delicious apple grown in Oregon. I only grow that variety of apple. It is more subject to scab than any other apple that I am acquainted with, and I grow it absolutely free from that trouble by spraying.

Exam. ROGERS. There has been some testimony here, Governor, that, while the fruit, the prunes and the apples, are of good quality, they are not suitable for shipping long distances; do you know anything about that?

A. Well, I have sold my fruit locally, as a rule. Only one year did I ship. I shipped my Delicious apples. I had two cars. I shipped them to Texas, and got good results from them.

With reference to the production of hops, western Oregon (2719) is the largest hop-growing district in the United States. 1463 The principal market for hops is in the East and Middle West. The hops move by rail, I think, rather than by water.

Q. Have you anything further to add to your testimony, Governor, as to the need of the State for the construction of the cross-State line, or as to the benefits which might accrue to the State from its construction?

A. Well, I have felt for a long time that the construction of the cross-State line would tend to develop the State of Oregon more rapidly.

Q. Do you know the sentiment of the people of this State as to whether there is a need or demand for the construction of the cross-State line?

A. I think the people of the State think there is.

Q. In your opinion, is the construction of a line such as is proposed in this case vital to the complete and satisfactory development of the State and its natural resources? (2720.)

A. Well, I don't know about its being vital. It would certainly do all the things that we are talking—I believe that it would do all the things that we are talking about. It would cause advancement in the State and development in the State more comparable with those in the States on the north and the south.

Exam. ROGERS. Can you tell us, Governor, what the State has done in the way of providing roads for this territory that would be traversed by the cross-State line? What I had in mind, I got the impression from some of the, at least inferences in the record that the State itself hadn't thought enough of this country over there that this road would go through, this proposed railroad, to provide it with roads, highways. Can you give us your knowledge of that situation?

1464 A. I know something about that. My figures may not be exactly correct, but in the main they are correct, or very close. In securing our funds for building of highways in Oregon, the territory we are talking about pays in about 20 per cent of the funds. In the allocation for the construction of roads we spend about 40 per cent of the funds in the territory east of the mountains. Last year, or within the year, there has been 27 miles of road constructed in Deschutes County, leading toward Burns.

Q. (By Mr. ELLIS.) Just one more question: Has it been your (2721) observation, Governor, that railroad construction has usually preceded colonization and complete development of natural resources in the various sections of the country, or would you say that colonization usually comes first and the railroads afterward?

A. I think the railroad comes first, as a rule.

Q. In your judgment, would additional transportation facilities in central and eastern Oregon be of any assistance in colonizing and developing the irrigation projects that are now in existence?

A. It certainly would.

Cross-examination:

Q. (By Mr. SPENCER.) Governor, if there was a railroad through central Oregon, would you encourage or sanction any activity to put settlers on the Silver Lake irrigation district at the present time, in view of the financial condition?

A. Well, will you change your question and say on any of the irrigation districts?

Q. All right, I will put it that way.

1465 If we are—if the State board is able to work out the settlement of those districts as we have now under consideration and are working on, I would say yes. (2723.)

Q. Well, if the bondholders cannot be settled with, what would you say?

A. Well, I think they can be.

Q. I know, Governor, but I am assuming that you can't accomplish your settlement with the bondholders.

A. Well, I am——

Q. Under the existing debt burden against these several districts, the Silver Lake and the Summer Lake and Ochoco and Warm Springs, would you expect any settlers to get under that load and try to work out, or would you sanction the encouragement or inducement or the attempt at inducing settlers to go on those districts?

A. When those districts are worked out, as I anticipate they will be, and be successful—and I think everybody thinks they will ultimately—I would say yes.

Q. Well, I want to know the possibility, and, in fact, we have had this difficult situation now, or the State has, for some six or seven years, hasn't it, the question of solution of the financial problems on these irrigation districts?

A. Well, it has been—I think you overstate the time. I think that you might say that the last two years is about the time that it has been under real consideration and something trying to be worked out.

Q. Well, I know, but the condition that necessitated action by the last legislature toward some—during the previous (2724) administration, did it not?

A. Yes; there was trouble there, of course, had been for——
1466 The districts were involved and State bonds were issued to pay interest on the outstanding bonds of the district, and then the interest on the State bonds wasn't paid and that condition has run along now for four or five years. Perhaps more in some instances. I will answer the question whether with that condition whether with the existing condition, any man should undertake to go on any of these districts as a settler until it is solved. But I would like to just say something else in advance of it. You are aware of the fact that when these irrigation districts were constructed probably not over 50 cents on the dollar went into the construction, was eaten up by organization and one thing and another so that the settlers on the district—or the land under the district actually paid double what they should have paid. In other words the districts were indebted double what they should have been. (2725.)

The bonds at no time should have been more than about half what they were. Under present existing conditions I wouldn't advise a settler to go in on the irrigation districts. But those conditions are not going to prevail. It is a big problem. It is so important that the 1927 legislature took action with respect to it and commissioned me as head of a board to attempt to work it out.

I was asked about the road development and the road program of the State, how it progressed. I stated that the State in its State highway system has expended over $100,000,000 since 1917 when the program started. It is true that that construction except for the so-called Roosevelt Highway on the Pacific coast has been made almost entirely along and against and adjacent to existing lines of transportation. (2726.) There has been a very large mileage in western Oregon. From Portland, Oreg. to Huntington the trunk highway parallels and is adjacent to the railroad all the way.
1467 So is The Dalles-California Highway. I spoke of the expenditure in the Deschutes Canyon. It goes along and parallels the Great Northern and the Southern Pacific all the way through the State to Klamath Falls and beyond.

There has been construction of State highways in this great central Oregon territory. You can drive on a perfectly fine State highway, not paved, but rocked and oiled—many people think they are driving on pavement—you can drive all over that country on it.

Q. From where to where? (2727.)

A. Well, you spoke of Klamath Falls. You can drive from Klamath Falls to Bend, and——

Q. Paralleling the Southern Pacific and Great Northern Railroad.

A. Well, I don't see your point there. That——

Q. Well, the point is, Governor, that you say we must have rail and transportation development, as I understand you, in this unsettled country commonly referred to as the great high desert in here. Now, are there any roads southeast from Bend, away from the rail transportation, any State highways?

A. You can drive on a perfectly good road up to—what is the name of that town?—Prineville, and on beyond Prineville and into the mountains.

Q. That is through the forested areas to the east. I am asking you about this country that is now related to be suffering for transportation and requiring the cross-State line. The red line through the map, through Exhibit 3, and on this map, indicates the center of it, and I am asking you whether there is a good straight highway north or south of it or parellel to it for an area in there for 150, 160, 170 miles?

A. Naturally, the demands upon the State for the construc-
1468 tion of the roads were in populous communities, and with forty-five hundred miles of road to build the more populous communities (2728) got the road first, and, as I stated a while ago, we have put in that country twenty per cent, approximately, more than their share, if you divide it on shares, account of the interest of the State in the road, and now, as I say——

By "that country" I mean the country east of the Cascades. We built last year here, you heard me state, 27 miles, and will build more the coming year. That 27 miles skirts along the south slope of the Blue Mountains from Bend to Burns, along a practically straight line. That is not all that has been built in that district; there has been other building along there, not by the State but I think the State has cooperated in other road building. I am not entirely familiar with road building. The commission handles it. I do not know what the program in contemplation is as to highways over in this central Oregon section. I do not know what the program is to build a road from Bend to Burns. It can not be done in a day. It is a considerable distance. Our funds are hampered and at present more or less in (2729) jeopardy. I am not familiar enough with it to say that I know of any other road construction that is contemplated over there.

I have been through that central Oregon country. I have driven down through that country in connection—I went as far south as Lakeview; and I have been to Burns. I have not been across the

country down into the adjoining country as far as Nevada. As to whether there has been much development in the State of Nevada in the last 20 years, I am not familiar with it at all. I have never been through there except on the railroad and have not been through there on the railroad for 15 or 20 years. I do not know how it compares in general topography and appearance to this so-called central Oregon desert country. (2730.)

1469 As to how business is routed from the western Oregon country, that is, traffic originating on the Southern Pacific line in western Oregon or on the Oregon Electric, I don't know enough about it to make a sworn statement in regard to it. If I can believe the press, why certain portions of that freight—that south of Eugene, say, takes a far greater mileage than it would if we had a cross-State line.

I know where Roseville is in California, near Sacramento. I imagine if it goes down through there and thence east to Odgen it is very much longer route than it would be via Portland and the Columbia River route. (2731.)

Marion County and Washington and Yamhill and Polk I think are the best western Oregon counties there are.

Q. And the greatest developed, probably the best productive soil, and the greatest population?

A. Well, I don't know about the greatest—the best soil in that. We have some advantages they haven't in the other counties south, but I think some of those counties are very productive counties. We have an advantage in lateral lines of railroad and highways, and things of that kind, that tends to bring about that result.

Comr. McMANAMY. Now, Governor, in the interest of getting the record straight with respect to this highway construction, you have a first class highway across from Eugene to Prineville and Bend up the McKenzie River, do you not?

A. Yes.

It doesn't parallel any railroad. We have a good highway from Medford to (2732) Klamath Falls via Crater Lake. That parallels no railroad. We have a good highway from Ashland to

1470 Klamath Falls that parallels no railroad. We have a good gravel highway from Pineville to Mitchell, and the John Day Highway from Ontario to Arlington only paralleling railroads for a part of the distances. The Fremont Highway, which leads down into the Lakeview country from Bend, may parallel a railroad part of the way. I have never been over that road. I don't know.

The highway from Bend straight across to Burns is developed to the extent that a stage line is operated over it, and I drove out over there a week (2733) ago Sunday, 149 miles, in four and three quarters hours.

There is a good highway from Willamette Valley from Eugene to central Oregon.

Comr. McMANAMY. And there is a good highway from the valley of the Rogue—two, in fact—to Klamath County?

A. Well, there is more than that. You can go to Klamath County from the Rogue over the Green Mountain road—that is out from Ashland—you can go by Crater Lake, and then you don't have to drop down to Klamath, you can go north from Crater Lake on into Bend.

Comr. McMANAMY. There are a number of cross lines from the Willamette and the Rogue and Umpqua Valleys to the Roosevelt Highway?

A. Yes; and others in course of construction.

Comr. McMANAMY. I have no more questions concerning the highway system. Will you, or do you care to, give any further expression to the needs of the eastern and central sections of the State for additional transportation facilities, which probably should include both highways and railroads?

A. I think there is a need for both highways and railroads. (2734.)

1471 Mr. SPENCER. The summary which the commissioner has made with you over this highway construction, Governor, is located entirely in western Oregon? If you treat a line extending from Sherman, at the mouth of the Deschutes River projected down through to Klamath Falls, if you consider all the territory between that line and the Pacific Ocean as western Oregon, the highway construction is in that district, isn't it?

A. I don't know just what you mean.

Q. Looking at the map there, Exhibit 3, I call your attention to the mouth of the Deschutes River at a place called Sherman, and I have projected a line all the way down the east slope at the foot of the Cascade Mountains to Klamath Falls. Now, all of the mileage that you have discussed in answer to the questions propounded by the commissioner is in that district, isn't it, except the John Day Highway?

A. The highway from Burns to Lakeview.

Q. Is there a highway from Burns to Lakeview?

A. Yes: a sort of one.

Q. Well, it is a jack-rabbit trail, with high centers, and with no State recognition, isn't it?

A. There is some construction there. There is also a highway (2735) from Lakeview to Klamath.

That is pretty near completed. It will be this fall. There is just a short road to let. (2736.)

Q. (By Mr. DEY.) Governor Patterson, I take it that you would not want to leave the impression here that the railroads operating in Oregon have carried on no development work or new construction within the last ten or twelve years in the State?

A. No. They have done a good deal of construction.

Q. Yes. The very expensive line to Coos Bay has been a very helpful thing, has it not?

Q. Yes, sir.

1472 Q. Costing some 14 or 16 million dollars. And within the last two or three years the Central Pacific, operated by the Southern Pacific, has spent some 20 millions of dollars in connecting up the Klamath Falls territory? You are familiar with that?

A. I am.

Q. And the Great Northern has extended from Bend down to Klamath Falls within the last year or so?

A. Yes.

Q. You are also familiar with the fact, are you not, Governor, that the Southern Pacific is now spending several million dollars more in building a line from Klamath Falls through Alturas, which will give a more direct route to the East?

A. I am.

Q. Now then, there is just one thing: It may have been cleared up but if it was I didn't catch it as it went into the record. (2737.) You spoke of a territory that contributes to the State highway fund about 20 per cent of the total, in which territory some 40 per cent of the highway fund has been expended, and by that territory you mean everything east of the summit of the Cascade Range, do you not?

A. Yes, sir.

Q. That is the entire eastern Oregon territory?

A. Yes.

My farm is 5 miles from the Oregon Electric line. That line runs southerly from Portland to Washington and Marion Counties touching Benton, Linn, and Lane Counties. The cross-State line would probably not be of any direct advantage to farmers who are served by the Oregon Electric line, at least those from Salem north, but I don't see how you can develop any part of Oregon
1473 without helping all parts of Oregon.

Q. So far as you are concerned, assuming that you can reach the Oregon Electric from your farm, you have a satisfactory (2738) route via the Oregon Electric to Portland and hence easterly via the Northern Pacific or Great Northern, have you not?

A. Yes.

Q. And that would be true of all of the territory served by the Oregon Electric until you get down toward Eugene, where something might be saved in mileage by a cross-State line; that is correct, is it not?

A. Yes.

Q. And the total distance from Portland to Eugene traversed by the Oregon Electric is about 125 miles, is it not?

A. Well, I assume that is correct. I don't know.

GEORGE W. BUCK thereupon resumed the witness stand and further testified as follows:

Redirect examination:

I was asked during the cross-examination whether or not I knew of any line that traversed an unproductive country when it was

built, and I referred to the construction through southern Idaho and the conditions obtaining there when I first went through that State. (2739.) There is not in my opinion any comparison in the central Oregon country with the southern Idaho country as to
1474 soil conditions or as to water conditions. I have not known of any construction across unproductive lands unless there was an objective that furnished traffic at each end. I can not conceive of any traffic for the bridge line here involved if it stopped at or near Crescent Lake. I have never considered that southwestern Idaho traffic as having any basis of going west.

Q. That banks right up against the Oregon Short Line main line, doesn't it?

A. It does; yes, sir.

Q. And is penetrated by branch lines connecting with the main line?

A. Yes.

Q. Now, you were asked whether if conditions as they obtained in 1905 or '06 could be restored, whether the gap across the State as it was referred to could be or probably (2739) would be constructed. What differences have taken place affecting the serving of the western Oregon country by railroad since 1906? I wish you would comment on rail lines that have been built that affect the business from western Oregon and also any other transportation agency that occurs to you.

A. Since that time the North Bank was built from Spokane to Portland and up the Deschutes River to Bend.

Q. By S. P. & S. you mean the Spokane, Portland & Seattle?

A. The Spokane, Portland & Seattle, the North Bank.

Q. I meant the North Bank.

Q. The North Bank, the Spokane, Portland & Seattle Railway, is that a competitor for Oregon and Portland business with the Oregon-Washington Railroad & Navigation Company?

A. It is. On eastern business, it being a joint property of the Great Northern and the Northern Pacific. We figure as to Chicago as a common eastern point. (2740.) I have always
1475 figured Chicago as the common eastern point for traffic, for all the lines in this territory.

Q. Do you know what connections the Northern lines have into the Colorado territory, or into the Texas territory, or into Missouri River?

A. They control the Chicago, Burlington—the old Burlington route. Also the Colorado & Southern, I think. The Panama Canal was built since this line was projected, which I understand greatly reduced the lumber shipments on the O. R. & N. to the East, lumber going through the Panama Canal. The Oregon Electric has been built since that time from Portland to Eugene, that being controlled by the Great Northern or Northern lines. On the east side of the Cascade Mountains the Oregon Trunk built up there and also the

Des Chutes Railroad to Bend. The Great Northern has built from Bend to a connection with the Southern Pacific line, with joint user to Klamath Falls. The Southern Pacific (2741) has built from Natron to Klamath Falls and rebuilt their line south from Klamath Falls. The Oregon, California & Eastern has built east from Klamath Falls to the Sprague River, and the Klamath Falls-Alturas line has started construction.

Exam. ROGERS. You will recall, Mr. Buck, that the only hypothesis I included in my question, as distinguished from the questions of Mr. Ellis and Mr. McCulloch, was if there was a merger or joint operation of the Southern Pacific and Union Pacific, in upclosing this gap.

A. You mean if they were merged again. My opinion would be that I would join it up. But that might not be practical from the demands of traffic. I mean from my standpoint as a railroad proposition. I don't claim to be an authority on the construction of railroads. That contemplates giving access to all of the traffic in western Oregon. (2742.)

Comr. MCMANAMY. Well, following that proposal, do you think that the fact that the Union Pacific and the Southern Pacific
1476 are either one or two systems would affect, either favorably or unfavorably, the interests of the public in transportation?

Mr. SPENCER. Oh, I object to a question of that kind being propounded the witness. I don't think that is a proper question. It involves a question for the commission to determine, a legal question for the courts to determine; and what his idea of public interest is in the matter it seems to me is an improper question, Mr. Commissioner.

Comr. MCMANAMY. I think I will have to overrule your objection, Mr. Spencer, because the commission is seeking all the information it can get.

Mr. SPENCER. Well, that is not information.

Comr. MCMANAMY. If this witness has an opinion on that we will be glad to have it. If he does not care to express his opinion he has the right of course to say so.

The WITNESS. I don't believe I will express any opinion on that. (2744.)

Recross-examination:

I made no statement or inference that this construction that I outlined as having taken place in recent years was all designed to substitute for the original intent of this cross-State line. As to whether it would serve any of the purposes intended to be served by the cross-State line all of it up the Deschutes River into the Klamath country, into the yellow pine belt, takes the place of it.

I would not say that none of it is a substitute, so far as the through transportation of transcontinental traffic from western Oregon eastbound, or traffic from southwestern Idaho and interior Oregon westbound to the Pacific coast. I would have to make a study of it before I could answer that question. I could not say as to whether

at the time the cross-State line was originally projected the traffic of all of western Oregon was moving east through the
1477 Portland gateway. Neither can I say as to whether it was the design of the carriers in proposing the cross-State line that all of the western Oregon (2744) traffic from Portland to the California line, should be handled over the cross-State line when destined east. At the time that this line was proposed they didn't even know whether they could build a line across the State. No one had ever gone over there and knew that they could build this line on reasonable grades. As to the whether it took long to find that out, it took about a year and a half. As to whether I know anything about the original intent as to the handling of the western Oregon traffic over this line, I stated quite a while back in my testimony that I came here from the East and did not know conditions on the west coast. As to the congested conditions, or fear of congested conditions, through the Portland terminal that existed at that time, I didn't come to Portland until 1909 and at that time my recollection was the O. R. & N. was carrying a heavy traffic of lumber to the East, but I was not interested in traffic (2745) statistics or conditions.

Q. As a matter of fact, in spite of this amount of construction of north and south line and of branch lines that you have mentioned, there has been no additional east and west transportation line constructed between Portland and Sacramento since the construction of the Union Pacific dowr the Columbia River?

A. Not in Oregon.

RHEA LUPER was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am State engineer and secretary of the State reclamation commission. (2746.) The State reclamation commission is composed of the governor, secretary of state, and State treasurer, constituted under an act of the 1927 legislature. It took over the duties of the State desert land board and of the irrigation and drainage securities commission, and some added duties.

I am here in response to a subpœna and have brought with me the reports called for in the subpœna. (2747.) Those reports have been filed officially with the board. They are of public
1478 record.

Referring to the question in regard to the added duties or the real purpose for organizing the commission (2748) the irrigation and drainage securities commission consisted of five members, the governor, the State treasurer, the State engineer, the attorney general, and the superintendent of banks. The State desert land board consisted of the same men, except the superintendent of banks was not on it but the secretary of state was. As to the most serious problem confronting this commission with respect to irrigation districts not Federal irrigation districts: The irrigation law was enacted in 1917, and a number of districts were organized and issued bonds. Some of them had constructed their works,

the bonds had been sold after an investigation of the project and certification by the State irrigation and drainage securities commission: Then under the law the State could advance interest for the first five years, or guarantee interest on these bonds and the guaranty had been extended under contracts with many of the districts and some of them were over-capitalized and the debt was too high, put on there when the land values were high and they were (2749) unable to meet their obligations and this commission was authorized to try and bring about an adjustment between the creditors of these districts and the land owners, and it was also authorized to make examinations to bring out the facts on which such reorganizations could be worked out. When a district defaults, it is as badly involved, regardless of the amount of its debt. The Slide, the Ochoco, along the Snake River across from Weiser, Warm Springs, Deschutes Municipal, Crook County improvement district, Silver Lake, Summer Lake have all defaulted. Referring to report on the Warm Springs irrigation to the State reclamation commission, dated December, 1927, on page 68 the condition is as follows: "Desperate as is its financial condition, the district is not without (2750) 1479 tangible assets, by liquidation of which it perhaps may attain a degree of success impossible under present conditions, although this can be done only to the accompaniment of universal sacrifices." Is that the condition that district is in?

A. The Warm Springs district contains, according to that report, about 12,000 acres of excellent land, and about 5,000 more that will be able to pay irrigation charges. It originally was designed for 31,000 acres, and the debt and water was provided for 31,000.

It was built during the war, under a cost-plus contract, and when labor conditions were bad, so that the costs went up very much higher than originally estimated.

They developed a good water supply, but they did not have money enough to put in their drainage system, so instead of having 31,000 acres of irrigable land they only have 18,000 or 17,000. They had a surplus of water, and that was sold to the Vale irrigation project, to the United States Reclamation Service, adjoining, taking the water from the poor land in Warm Springs project and putting it on good bench land immediately adjoining.

So the entire water supply that was developed by this original bond issue will be used. The lands remaining in the district can't pay the entire debt, and there will have to be a portion of it written off before the district can be said to be in a sound financial condition. (2751.)

Q. But I asked the question, Mr. Luper, whether or not this report which you handed me correctly states the situation as I read it, on page 68?

A. Well, I thought I stated the conditions as I see it. I am secretary of the commission. That is not my report. That report was made by the United States Department of Agriculture and

the experiment station of the Oregon State College, and my work is sort of as executive secretary, and much of it is done under my direction.

1480 It is true that the district is in bad financial condition and that there will have to be some losses sustained by creditors. The report doesn't make an estimate of shrinkage, but unquestionably the bondholders will have to shrink their bonds. (2752.) I would not care to answer how much. I think it has already been publicly stated that the Ochoco bondholders had offered a settlement on the basis of fifty cents on the dollar, taking refunding bonds in exchange. With only the district back of the refunding bonds. That refunding has not been accomplished yet. Under this plan and under the district plan of irrigation upon which these different districts are based, the entire land, every acre of it, is liable for the debt. Every irrigable acre. The bonds are a general obligation of the district and a man can't pay his share of the total bonded debt of the district and obtain his release without the consent of the bondholders. Under the conditions I would not advise any settler (2753) to go out there and work it out and pay the full debt, until this readjustment is made. That is the problem as to all these districts. Summer Lake is the worst as far as the debt is concerned, per acre per settler.

Exam. ROGERS. Mr. Luper, I want to get the right impression about this. I know some of our railroads sometimes get in a difficult financial condition due to the way their finances are handled; some of them get in financial conditions that are difficult because there was not anything there to start with where the railroad was built. Now what is the situation of these irrigation projects? Is their financial condition due to the way they are financed or because the (2754) projects themselves were improper to start with, that there was not anything there to justify an irrigation project?

A. Well, as a general rule, the difficulty is almost entirely due to financing, too much debt, low estimates to begin with. For example, the Warm Springs started out to build a project with $550,000.

1481 They voted $550,000 in bonds and started work, didn't get through, and they voted some more bonds, still were not through, and they voted some more. After they started they had to complete or they didn't have any value from any part of their expenditure. So when they had a completed project they had a debt that was greater than they could pay, and then with the general obligation of the bond it demoralized the settlers. Each man was afraid he was going to have to pay the entire million and a half debt, and the result was that many people didn't make improvements on their land. While they are all farming now the good land, yet they are not farming it as well as they will later after the readjustments are accomplished.

Q. What percentage of these different districts, the area in them, is owned by the counties that they bid in for taxes? Is it very large?

A. It is large on the Warm Springs, because most of the poor land is now owned by the county; about forty per cent. It is less on the Ochoco.

If the bondholders do reach a settlement (2755) I expect these projects to continue operating, and they will be of course much more successful and productive.

Cross-examination:

If reasonable rearrangements with the bondholders of the securities of these various districts can be effected, in my judgment, settlement of farmers thereon and the development of the latent resources of those districts can be successfully carried out. In my opinion there is nothing in prospect for the holders of the securities of these existing projects if they refuse to enter into reasonable financial arrangements, or rearrangements and scale down the indebtedness against these projects that now exist. In view of the alterna-
1482 tive of getting nothing or of making some reasonable readjustment of these obligations, in my opinion, the prospect for effecting these financial rearrangements that the board is trying to work out is almost certain, in a way, because I can't conceive of men staying out of an organization and blocking it indefinitely. (2756.) As to whether we have made satisfactory progress toward that end during the recent work of this new board, I will say that my experience in dealing with bondholders is that they are very fair. Sometimes they don't understand the situation, but my experience has been there have been only one or two refusals. I think additional railroad transportation through the center of the State of Oregon would increase the value of their land and a demand for it and give the farmers additional profits on their products. They could grow other things. I think it would increase the extent to which the land is utilized.

Redirect examination:

I think we had better clean our slate first before we build any more immigration projects.

I have never made a study of the prospect in the west end of Christmas Lake Valley, known as Fort Rock (2757) Valley. I have considerable data in the office about that proposed project.

WILIAM G. IDE was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am here in response to a subpœna. I am the manager of the Oregon State Chamber of Commerce and our major activity for the last four years has been placing settlers upon our unoccupied lands. We have been operating jointly with the land settlement committee of the Portland Chamber of Commerce, composed of representative businens men of Portland. (2758.)

1483 I know something about the irrigation districts in central and eastern Oregon. I have been in touch with Commissioner Mead, as a representative of the State in that connection.

When we first began the work we made an attempt to put a few settlers on the Ochoco but after a little more careful investigation we decided not to continue that work, and we have not made any effort for the last three years to put any settlers on it.

I would not put any settlers on any of the irrigation districts referred to by Mr. Luper until there has been an adjustment of the bond situation (2759), the financial condition.

There are other irrigation districts in the State that are directly accessible to transportation that are not settled. I have put settlers on the Klamath proposition in Lake and Klamath Counties, the Westland district in Umtilla County, the central Oregon irrigation district in the Bend district and there are a number of smaller districts in central Oregon I believe we would be willing to put settlers on where they have no bonded indebtedness and are not in default, and where there is no general lien upon the whole project, so that a settler can pay out his obligation and get title to his property. The central Oregon irrigation district has no bonded indebtedness. It is near Redmond and runs down east of Bend. There is a Powell Butte that is all right. It is between Redmond and (2760) Prineville. None of those districts are fully developed and settled; they all lie adjacent to existing lines of railways. I would not think we need any more irrigation districts developed until we have settled what we already have.

The big problem of agriculture is marketing.

Exam. ROGERS. Do you mean there is no occasion for these irrigation projects, if they were not in financial difficulties, being put into operation, even though their financial difficulties are overcome?

1484 A. Oh, no; they are all right. Fundamentally the projects are all right. They were rather carelessly organized and financed, and the obligations were made without regard to the productivity of the land, and many marginal lands were taken in that should have been eliminated, and things of that kind.

Exam. ROGERS. I didn't know whether in your answer to Mr. Spencer about some of these projects that are now working (2761) not being fully settled, whether you thought there was not any occasion——

A. Oh, no; it is just because we have not been successful in getting the settlers. We are trying to get settlers for them all the time.

The first problem is to settle the districts, that are on a financially sound basis. Then the next problem is to work out some financial settlement with the bondholders and the State for these irrigations that are mentioned as financially distressed by Mr. Luper. Those are all districts where the works were built, canals were built and the water was put on the land. (2762.) There is some additional land that might be brought in, I assume. There is another set of districts that are not bonded yet. Take for instance the Harney Valley district of 60,000 to 80,000 acres. The bonds are authorized but none issued; and no works constructed.

Q. I am wondering whether there is any necessity of going in there under existing conditions, with the problems you have, to open that up—that is just an illustration—and settle it?

A. I think that is rather a large question for me to answer, Mr. Spencer. I personally think we should settle the districts we already have in existence.

As to how long it is going to take: That depends of course upon the advance that agriculture makes and the movement to the Pacific Northwest. You know what we have done since we have been here.

We have several years' hard work ahead of us on the (2763)
1485 material we have. I should say it would take five to ten years at least.

Cross-examination:

In considering these problems, I took into account the Vale and Owyhee projects that the Government is now building. I don't think anybody knows to what extent they are colonized. They have received a great deal of favorable advertising. There is a great deal of inquiry but no land will be available for settlement before 1930. The financial difficulties I have mentioned have no connection with the Vale and Owyhee projects. (2764.) As to what extent transportation entered into the question, we are interested in colonizing districts of course that have transportation facilities available at the present time. It is much more difficult to secure settlers who are willing to go in the frontier like and a long ways from transportation. As to the necessity of transportation preceding the colonization, I think the building of new railways always develops more or less new business that would not be developed otherwise. Under the present situation it is almost impossible to colonize districts not within reasonable reach of railroad transportation.

I think it would be a very difficult matter to successfully develop these irrigation districts that Mr. Luper spoke of without rail transportation, irrespective of their present financial difficulties. (2765.) When there has been a sufficient demand for agricultural lands, I think they could be successfully developed with rail transportation, leaving their financial difficulties out of the question.

The Oregon State Chamber of Commerce and the land settlement committee of the Portland Chamber of Commerce are interested in the development of the agricultural and other resources of the State through efforts to obtain additional rail transportation where it is

not now provided. We are interested in all matters of state-
1486 wide development. I have never given any study to the question of whether this proposed cross-State line from Crane to Crescent Lake would contribute to the development of the State of Oregon and don't feel that I am a competent witness.

Redirect examination:

In my work of land settlement, have had cooperation from (2766) the railroad companies operating in Oregon. I have had very help-

ful cooperation from the immigration departments of all the railways serving this State, and continue to receive it. They seem to be as anxious to settle these lands as we are.

I tell prospective settlers that certain fruits can be raised very profitably in the Willamette Valley. I tell them it is more hazardous to grow certain kinds than it is others. For instance, we have two or three very well developed (2767) apple growing districts where they have marketing associations among the farmers, where everyone sprays and they take care of the orchards and they produce a very high-class fruit.

In the Willamette Valley there is a lack of associations of that kind, and while one man might take excellent care of his orchard, the next man to him might not and he would be subject to all the diseases that developed from the careless man and it would be a hazardous undertaking for him.

The situation for pears and prunes is better. Pears have furnished a profitable crop during the past several years. Prunes have been a pretty bad crop for the past four or five years, because marketing conditions have not been good. But prune growers, in the business for 20 years, tell me that over a period of years, year in and year out, they consider it a fairly profitable crop.

I have been in this particular work for nearly five years but in colonization business for 20 years. (2768.) I came here in
1487 1908 as the colonization agent for the Canadian Pacific Railroad, but up to that time I was selling Canadian land to Oregonians. After I came here in 1908 I was colonization agent for the Canadian Pacific agent. In 1914 I became interested in Oregon settlement. I was in the colonization business on my own account. I know about the people who took up some of the dry country in central Oregon settlements. I did not induce them to settle there and I would not. I would not advise a man to go into central Oregon to do dry farming, except under favorable considerations, where he might be located on a running stream of water or have a spring available, or something of that kind, to produce his winter feed. (2769.) As to whether there is anything else down there that would influence settlers in going into central Oregon, along the line of this proposed road, where is some very good territory in central Oregon. I think the Burns country might be developed, and there are certain locations over there that could be developed all right. But, generally speaking, for instance I might say this, to show you our attitude: There are 13,000,000 acres of United State lands subject to homestead, the greater part of it lying on the high desert in eastern Oregon, and I get hundreds of inquiries from people for Government lands. I have a specially prepared circular that I send to every one of them, in which I specifically advise them that it is not the right thing to do to try to go over there and try to make a living; that they can't do it without irrigation and there is no irrigation available in most of that territory.

In some districts there are possibilities of subterranean water and pumping. The State made an appropriation a few years ago to develop some experimental wells in certain portions of central Oregon and put down those wells and there never has been but one of them used. The man over there has been using that well pumping with a Diesel engine and making a living, I guess. (2770.) I refer to John Ernst. I don't know whether he helps out with bounties.

Prunes are mostly marketed dried in the Willamette Val-
1488 ley. They raise mostly Bartlett pears and they are mostly handled by the canneries. (2771.)

Exam. ROGERS. Well, perhaps I didn't understand exactly what you were getting at. There has been some testimony here that the fruits of the Willamette Valley, the apples, pears, prunes, were of a kind that could not be suitably shipped east fresh.

A. I don't know whether it could be said that they could not be suitably shipped fresh, but it is a fact that they do not ship as well as fresh prunes—for instance, as these raised in eastern Oregon; nor do the pears ship as well as those raised in the Rogue River Valley. But I would not say that you could not ship them fresh under certain circumstances, profitably.

I don't think the apples of the Willamette Valley have as good shipping qualities as the apples raised in a dryer country, in higher altitude. (2772.)

GEORGE F. CORNWALL, was thereupon produced as a witness on behalf of defendants, and, having first been duly sworn, testified as follows:

Direct examination:

I am here in response to subpœna. I am publisher of a commercial paper called "The Timberman." It was established in 1899, by my father. The territory of the Rocky Mountains, including Montana, Idaho, Oregon, Washington, California, British Columbia, Nevada, Arizona, New Mexico, Colorado, and Utah are embraced in the discussions in The Timberman. In the preparation of the data published in that periodical, we inform ourselves as to the timber stand (2737), supply, and markets, and kindred questions that are associated with the lumber industry in the United States.

At your (Mr. Spencer's) request I prepared a statement and summary involving different questions with respect to this lumber industry in the Pacific Northwest.

1489 (Said statement was thereupon received in evidence, marked "Defendant's Exhibit No. 53, Witness Cornwall.")

In explanation of the statement, the following questions were asked.

Q. The first table, entitled "Oregon softwood production," that is a thousand feet, as set forth in that table?

A. It is.

Q. Of the Douglas fir, pine, and other species, and the number of mills, in different years. The same information contained under the heading of "Washington softwood production," in the State of Washington, over the years there presented? (2774.)

A. Yes.

Q. And Idaho?

A. In the same manner; yes.

Q. And the table headed "Export domestic, waterborne shipments" what does that purport to show?

A. That shows the combined movement of lumber by vessel for the years 1920 to 1926, inclusive, from the States of Oregon and Washington. It also shows the markets served, both the domestic and foreign.

Q. The Atlantic coast referred to there in one item, is that timber that moves through the canal and is delivered to the Atlantic coast ports?

A. Yes.

Q. The Gulf ports, "The Gulf ports" is there in the same way?

A. Yes, sir.

Q. And the "percentages in the table of rail and water shipments," I guess it is self-explanatory. The first column "Rail" and the second column "Water" indicates the percentages that were moved in the years, water and rail, respectively?

A. Yes.

1490 Q. I would ask you, Mr. Cornwall, whether these percentages appearing under this particular table of rail and water shipments includes the lumber that is shipped to California by water? (2775.)

A. Yes, it does.

Q. Now, this heading on page 3, has there been any failure on the part of the railroads serving these three States to move the lumber in question tendered them for shipment with reasonable dispatch during the period since 1922?

A. The railroad service since 1923 has been, for the most part, satisfactory to the mills.

Q. And the next there, Nos. 6 and 7, show the mills and their location and capacity in thousand feet board measure in the States of Oregon, Washington, and Idaho, established since 1922?

A. That is correct.

Q. And the next table, No. 8, the new sawmills under construction in 1928, and capacity and location?

A. That is correct.

Q. Now, this 9 and 10, the names of the companies with sawmills projected in the different locations—do you know how far advanced or what stage of assurance obtains with respect to those different mills? The Kaskela Mill, for instance, is on the Deschutes River, isn't it?

A. Yes, that is in the Deschutes country, in the Warm Springs timber.

Q. Yes; do you know whether there is any assurance that that operation will——

A. Nothing more than they have a bond posted, I understand with the Government party selling the timber, and the conditions (2776) of the contract must be carried out within a reasonable time or it will be forfeited, as I understand it.

Q. And The Dalles, Oregon, that is the old Heimrick operation, Fairchild and associates?

1491 A. Well, that is still in process of incubation, as it were.

Q. What about Boutin of Lakeview?

A. Mr. Boutin owns substantial acres of timber in the Lakeview district and is preparing to establish a mill. It may be slightly over the Oregon line into California, but it is in the Lakeview district.

Q. And the operating capacity as of July 15, 1928, you say is about——

A. 75 per cent, it shows here.

Q. That is, you mean by that that the mills that are operating operate about 75 per cent of that capacity; is that right?

A. Well, I may have to amend this slightly, Mr. Spencer. According to the West Coast Lumberman's Association records of identical mills' cutting for the same period as last show a record of about 6 per cent, but there are a great many mills outside of the association which are not running, and it may be—I rather think the 75 per cent is still very close. (2777.)

Exam. ROGERS. What is this 75 per cent?

A. About 75 per cent of the potential capacity of plants that are in shape to run.

Exam. ROGERS. I don't yet understand it. Is that capacity or output or what?

A. Well, I assume this question that was asked by Mr. Spencer was more in the nature of capacity.

Mr. SPENCER. The question was to what percentage of capacity are the lumber mills in Oregon, Washington, and Idaho operating at the present time. Now, are they operating seventy per cent of the capacity of the mills?

A. I would say they were; yes.

Exam. ROGERS. That is 25 per cent below capacity?

A. Yes.

1492 Mr. SPENCER. You mean by that a one-shift stretch for a mill, or two shifts, or three? Very few of them operate more than two shifts, do they?

A. No; two shifts is—with very few exceptions, two shifts is the——

Q. The limit?

A. The rule, or the limit.

Q. Are they based on one shift, your estimate here?

A. No; I tried to give a picture of the production as a whole, that is, with respect to normal for the year, and as near as I could ascer-

tain it appeared to me that they were (2778) operating about three-quarters the normal rated capacity.

Q. Well, there are so many mills shut down, I was wondering how that could be 75 per cent capacity, if you count more than one shift.

A. Well, I think, Mr. Spencer, a large part of the mills that are down are of relatively small capacity.

I think the Grays Harbor Lumber Company is running again. The mills are large for the most part.

Q. Now, you take the capacity here is indicated on sheet 3 under Nos. 6 and 7; is that right?

A. Yes.

Q. Well, that is an 8-hour shift, isn't it? Take the St. Paul and Tacoma Lumber Company, Tacoma, Washington, 100,000 feet daily capacity—they have more than that with two shifts, don't they?

A. Yes; they would. These are on single-shift basis.

Q. And your answer to No. 11 would be on a single-shift basis?

A. Yes; I believe it would.

Q. Now, the mills shut down or suspended since January 1st, 1922—any comment you want to make on that? Page 5.

1493 A. With one or two exceptions (2779), most of these mills have permanently closed or burned. There are some on here that have been shut down for an indefinite time, but they may resume at any moment. For instance, the Peninsula Lumber Company, the last item on the list, is in shape to run most any time.

I think their trouble was largely financing.

The first one to close down, the C. & O. Lumber Company at Brookings, Oreg., was abandoned on account of lack of suitable transportation. The only market they had was California and a rather uncertain harbor. They are not on a railroad.

The Coos Bay Lumber Company has been involved in some financial difficulties, and they have shut down one of their units, known as Mill B.

E. E. Johnson, at Coquille, is shut down from financial difficulties.

The North Pacific Lumber Company became obsolete. (2781.) The plant became unprofitable. It would have required a very large investment to put it in shape; to modernize it.

The Dollar-Portland Lumber Company is somewhat in the same position, although it is in strong financial hands and could be operated if the owners so chose.

The Coast Range Lumber Company at Mable is in the same general ownership as the Dollar-Portland Lumber Company.

The Nickle Mills became involved in financial difficulties. By "financial difficulties" it is rather difficult to say whether through these difficulties, they wouldn't operate even though there was a good market. (2782.)

1494 The Wind River Lumber Company at Cascade Locks, as I recall that, a large investment in the mill was made and the amount of timber was miscalculated, and when it was found

that the amount of timber on hand would not liquidate the investment they scrapped the mill and took their loss.

The Beaver-Linton Lumber Company, at Portland, is having some difficulties owing to the market and other factors.

The Great Northern Lumber Company at Leavenworth, Wash., has been in more or less trouble for some years, and they are liquidating that.

The same applies to the Puget Sound Mills and Shingle Company, the Siler Mill Company, the Clear Lake Lumber Company.

The National Lumber and Manufacturing Company burned.

The Union Mill and Shipper Company at Union Mills, the owner of that died, and the heirs were anxious to liquidate it.

The Perry-Baker, at Everett, was dismantled and moved to Empire, Oregon.

By "liquidated" I mean the owners have decided not to operate any farther and have sold off the equipment. (2783.) In some instances they sell the plant as it is to some other operator, if there is timber available. Sometimes they are leased to other people, who buy timber on the open market.

The Menefee Lumber Company, at Ranier, burned.

The Kalama Lumber and Shingle Company, at Kalama, that burned.

The Snow Lumber and Shingle Company, at Littell, and the Leban Mills and Timber Company, the McCormick Lumber Company, the Globe have shut down, largely from financial difficulties.

The Winton Lumber Company, of St. Joe, Idaho, has been shut down, not from financial difficulties, but because largely the plant has not been economical to operate. It is in strong financial hands.

The Case Shingle and Lumber Company got down from financial causes.

1495 Rucker Brothers cut out their timber.

Klebb Lumber Company, at South Bend, was built without any timber, and after the mill was completed they found no timber supply and it was never able to run.

Jamestown-Oregon Lumber Company at Monroe was promoted shortly after the war and built at a very large expense, far (2784) more than it should have cost. The stockholders for that reason have not been able to make it pay. It has only run at one or two intermittent periods.

The Brighton Mills Company, at Brighton, Oreg., suspended chiefly from lack of timber, and also some financial difficulties.

Oregon Silver Spruce Company suspended on account of financial troubles.

The Hammond Lumber Company, at Astoria, burned.

The White Pine Box and Lumber Company, La Grande, and the Minam Lumber Company, at Minam, Oregon—I am not able to say just what caused those there, either of those two.

J. B. Kelly Lumber Company mill at Warrenton was burned.

The Peshastin Lumber and Box Company—I am unable to give the cause of that suspension nor of the Deschutes River Lumber Company.

Lindstrom-Handforth, at Rainier, burned.

Siuslaw Mill Company, at Tiernan, was shut down chiefly on account of the market, I understand.

The Wait Mill and Timber Company, at Granite Falls, was cut out.

The Washington Fir Lumber Company, Winlock—I can't say as to that one.

The Puget Sound Lumber and Box Company became involved in financial difficulties. (2785.)

The Oregon Box and Manufacturing Company burned. The Neff Lumber Company, at Aberdeen, went into a receivership.

1496 The W. H. Eccles Lumber Company, at Baker, was moved over into Idaho, and it has since changed hands.

The Peninsula Lumber Company, at Portland, has shut down on account of some financial difficulties. I think financial difficulties would involve the market to some extent.

(By Mr. SPENCER.) I would like to have that cleared up, if there is any question about it. I have checked here, besides the mills that burned, the following mills which from your statement apparently are dismantled or so obsolete that they couldn't operate: The North Pacific Lumber. The Wind River Lumber Company?

A. Well, I think the last was a miscalculation on the timber supply, which was responsible for the cessation of that operation. They spent a lot of money repairing it. (2786.) They couldn't operate it. The equipment has been sold and moved away.

Q. You so classify the Ferry-Baker Lumber Company, at Everett?

A. Part of the equipment has been moved out.

The Kleeb Lumber Company, at South Bend, is still there intact and could run.

The Eccles Lumber Company, at Baker, has been removed.

Q. Are there any of the others in that list that are in such condition as to operate if the market conditions justify it?

A. Do you mean by that that you want me to point out those that are in a position to operate if conditions were deemed satisfactory by the owners?

Q. Yes, assume they have got the working capital, and the owners are in shape to go ahead and the market justifies it?

Exam. ROGERS. Now, before you answer that, can you tell us which of them are shut down because the markets are not such as to make it possible for them to run?

A. Yes, Silverton Lumber Company. The Coos Bay Lumber Company, mill B; E. E. Johnson (2787), Mickle Mills,

1497 Beaver-Linnton, the Puget Sound Sawmills & Shingle Company, the Snow Lumber and Shingle Company, Winton Lumber Company, Kleeb Lumber Company, Jamestown-Oregon, Siuslaw Mill, Neff Lumber Company, W. H. Eccles Lumber Company,

Peninsula Lumber Company are in shape to run if the owners deem conditions right.

I understand the Dollar-Portland Lumber Company, at Portland, is in rather bad physical condition from not being kept in repair for the last several years, although the machinery is intact and could be made to operate with quite an expenditure. It hasn't been dismantled.

As to how many of these operations have been down more than a year: The Peninsula is rather recent. (2788.) Eccles is recent. Neff is recent. The Siuslaw Mill Company, Oregon Silver Spruce, Puget Sound Sawmill and Shingle Company, the Great Northern, Beaver-Linnton, Mickle, E. E. Johnson, Coos Bay Lumber Company, Mill B; those are within the last year or two, as close as I can recall them.

As to how we got this information: We have news sources; there are happenings that we had recorded from time to time and some from personal contact.

As to whether the supply of softwood lumber in the United States has been in excess of the demand for the past five or six years, it is rather a debatable question. We know that the cut has been large and the prices as a whole slightly weak, but the entire supply has moved into consumption. It is difficult to say whether a profitable operation or otherwise unless you segregated the different districts. I would say that the southern pine industry has made money on account of the favorable conditions (2789), being close to market, and things of that nature; and some of the mills out here that have owned their own timber and have logged and milled efficiently have made some profit (2790).

1498 Profits, as a whole in the fir belt, I presume would be deemed unsatisfactory, but I know of cases personally where the mills have operated at a reasonable profit. I think you would hear more complaint than satisfaction with the condition of the industry as a whole. There is a minority of the mills that have made some money and the majority of them have not.

Judging from the comments they make to us of the market conditions, I would say the same applied to the pine belt.

As to whether lumber manufacturing business has been in a depressed condition during recent years and its present condition, I answered that by saying that heavy production has caused a weakening in lumber prices during recent (2791) years, demand, however, has not absorbed the cut—that should read "has absorbed the cut," due in part to phenomenally large construction programs throughout the country. At present, values are firmer and this in the face of less building throughout the consuming markets. Curtailment of output accounts for part of the present market strength.

Mr. Spencer asked me two or three weeks ago to answer some general questions pertaining to the lumber industry and these are the facts as I saw them. This includes my father's and other people's

judgment altho I didn't consult anybody specifically but in obtaining the information I made some inquiry and investigation. (2792.)

As to southern pine production, there has been some complaint about business. The volume is 11,000,000,000 feet.

Q. And your observations in the following numbers there pertain to the Southern Pacific operation, do they?

A. Yes, sir.

Q. The last page is detail, given by States, of southern pine production?

A. Yes, sir.

Q. Item No. 24; is that right?

1499 A. Yes.

Q. Let's see; that is the year 1926.

A. 1926. That is the segregation of the general figure under (2793) 1926 and item 20; those will be found to check.

Items 25 and 26 cover the consumption of softwood lumber annually in the United States for the years 1920 to 1926, inclusive. It does not include the lumber that is shipped offshore. By offshore I would assume that you mean foreign markets. But it does include that which moves to Gulf and Atlantic seaboard and California.

Q. And you distribute that in Table No. 27?

A. 27. That includes hardwoods, because I had no information that segregated them.

Mr. McCulloch. Mr. Spencer, could you file for the record a list of the questions to which these numbers 1 to 28 are answers? There are some of them that don't seem to be intelligible without the questions. At the top of page 7, for example, No. 18, the answer is "yes; when built to safeguard owner's timber investments or to salvage timber in jeopardy from a variety of causes." (2794.)

I will give you question 18: "In your opinion, will the interests of these States or of the United States, or of individuals as owners of timberlands in these States, be served to advantage by the construction in the near future of mills of substantial capacity for the manufacture of lumber?" Now, you answered that, "Yes; when built to safeguard owners' timber investments or to salvage timber in jeopardy from a variety of causes." But otherwise what would be the fact?

A. Under present conditions there is ample sawmill capacity in the United States to take care of the demand, I would say. But new mills may be built where present plants are obsolete, or where timber is in jeopardy from beetle, such as it is in the Klamath

1500 section and in certain districts, or where the increasing tax burden in the county has become unbearable to the owners. (2795.)

(Thereupon the copy of questions so offered and received were attached to and made part of "Defendants' Exhibit No. 53, Witness Cornwall.")

Cross-examination:

As to the present practice of purchasers or jobbers of lumber, dealers in the Middle West and East, as compared (2796) with a few years ago: There has been some tendency in recent years toward buying from hand to mouth; in other words, not stocking up as largely as they used to do in the spring and fall. I can not say as to whether that tendency has had any effect on the mills of the Pacific coast located more distant from those markets.

Time in transit is a factor in enabling the mills of the Pacific coast to compete with other producing sections in those markets of the Middle West and East that buy in small quantities for immediate use.

Q. Is it reasonable to assume from that fact, from the condition, and the circumstances you have described, that the distance of western Oregon producers from the markets of the Middle West and East may have been one of the principal factors causing their financial difficulties?

Mr. SPENCER. I didn't ask the witness anything about that one direct. I don't know whether he is qualified to talk about it or not.

Mr. ELLIS. Well, he has testified a great deal about the financial difficulties of the miller, of the sawmill operators. (2797.)

The WITNESS. I don't think I am qualified to answer that.

Exam. ROGERS. I thought you said, Mr. Witness, that one of the advantages that the southern producer had was that he was closer to the market. Didn't you say that?

A. I did. I believe my answer would be "yes" to that. That question became rather involved and I presume I got lost.

1501 Q. What did you have in mind in answering question No. 5, which is as follows: "Has there been any failure on the part of the railroads serving these three States to move the lumber in question tendered to them for shipment with reasonable dispatch during this period since 1922?" to which you answered, "Railroad service since 1923 has handled tonnage offered at reasonable dispatch."?

A. I meant by that, that the time in transit has been short, and, as far as I know, there have been no complaints on account of car shortage. My answer was intended to be general in character and applying to all of the Pacific Coast States. I did not intend that it should be construed as applying particularly to any local conditions that might exist in western Oregon. (2798.)

I can't say exactly how long it takes to move lumber from western Oregon to Mississippi River points. I know of one shipment made from Portland, a special item, sent to Chicago from this city, in five days. That was a special item that was attached on to a fruit express train. And I also have heard of instances of deliveries made in Colorado in six days under, you might say, ordinary conditions. I could not say what the ordinary time is, except that it is considered by the lumbermen to be a great deal shorter than it was five or ten

years ago. In a great many cases time in transit has been cut in two. A representative of the Hallick & Howard Lumber Company of Denver was in my office yesterday and said that he is now receiving shipments in ten days to Denver, and that five or ten years ago it was not unusual for that same shipment to take (2799) six weeks. My answer to this circular is not based on that information. There have been no complaints, as far as I know, of car shortage, offered at any of the meetings of lumbermen I attend, and it has been the general opinion that the shortening of time in transit has caused a totally different type of buying. In other words, the buying is distributed throughout the year instead of coming at seasons
1502 as it used to. This is attributed by lumbermen largely due to the faster handling on the railroad.

Q. In answer to question No. 15 you conclude by saying, "Well located plants with good timber and efficient management have shown a fair profit." Where are these plants that have shown a fair profit principally located?

A. There are three in the city of Portland that show a healthy balance sheet every year, and have for a great many years past; and the mills at Bend, and several at Klamath Falls, and one at McCloud have been profitable institutions through most conditions.

Q. Is it not a fact that all of these mills that you have listed as showing a profit are mills located on tidewater, or where competitive rail service exists? (2800.)

A. Not in the case of one I have in mind in northern California, McCloud River Lumber Company. It is cutting the same class of timber and is exactly the same as the mills in Klamath Falls, to all intents and purposes. As to any in Oregon or Washington I would class with the McCloud Lumber Company, I would place the Shevlin-Hixon Company at Bend in the same category. It is owned by the same people. They have competitive rail service there.

As to whether I know of any that are located at points served exclusively by the Southern Pacific Company in western Oregon and having no water transportation available that have operated at a fair profit, I haven't access to their statements. I arrived at the fact that they operated at a fair profit merely from what they tell me. There are a number of well located plants, with good timber supply and efficient management, on the lines of the Southern Pacific Company in western Oregon. (2801.)

I am not certain as to the present status of the Siuslaw Lumber Company. I understood it was shut down at the time this list was made up. I would not be surprised if that mill had been shut down for the past five years instead of the last two. This list purports to read from January 1st, 1922.

1503 Q. Do lumber manufacturers in Oregon and Washington, as you have come into contact with them, regard as desirable the use of the shortest routes in reaching markets, and the routes that will enable them to get into consuming markets in the quickest time?

A. I have never heard any discussion of that.

Exam. ROGERS. Have you ever heard it discussed, in view of this changed method of buying and carrying smaller stocks, that it was desirable to have quicker deliveries? (2802.)

A. No; I can't say that I have.

I do not assist in any way in the location of new mills coming into the territory. As to whether there is any difference in the tendency of mills to locate in a place where there is only one line of railroad as compared with two or more, that would depend somewhat on the character of the timber they had in mind. We have the case of the Pacific Spruce Company, at Toledo, Oregon, which purchased one of the wartime properties because it had a very exceptional stand of spruce, high-grade spruce, and some excellent fir. That choice I think was made on account of the excellence of the timber rather than transportation.

It would have to be high-grade pine, such as found in the Klamath district, before the one or two or three lines would make any difference. Mills have gone in the Klamath district without regard particularly to the competitive rail situation.

A large part of the desirable Douglas fir timber (2803) has been adjacent to tidewater. They have in a great many cases enjoyed the benefit of water transportation. It is very desirable in the Douglas fir region. As to what difference it makes with regard to fir, whether they have one road or two in the location of the mill, if they have no water I would say it would be desirable to have more than one line so that it could reach different markets.

Hemlock is a wood that is probably used largely for pulp and paper. I have never heard of anybody building a mill
1504 specifically to cut hemlock. It has been regarded as sort of a drug on the market, although a very valuable wood.

Pine is an inland species. You can't consider water transportation there. It would be desirable I think in most cases to have more than one road (2804), for wider distribution of market. Possibly it would bring improved service in the matter of cars in times of shortage.

Cedar does not grow in pure stands. It is usually a by-product of some other form of logging, with the possible exception of the white cedar of the Coos Bay district. That is profitable enough to be logged separately. The largest part of that is exported.

Redirect examination:

Q. Wherein is any mill located on the Southern Pacific lines in western Oregon, and exclusively so located, limited as to distribution of markets because it is on one railroad only? The Portland gateway is open?

A. Yes, sir.

Q. And joint through rates with all the Northern lines, is it not? (2805.)

A. That is correct.

Q. And with the Union Pacific?

A. Yes.

Q. And then of course south through whatever gateway exists. There is an absolute freedom for these lumber shippers out here on the coast, isn't there, or in western Oregon, so far as gateways are concerned?

A. Yes; that is true.

Q. Now then, with respect to being located, in answer to a question asked you by Mr. Ellis, you say that the McCloud River Lumber Company has been able to operate profitably at McCloud, Calif.?

A. Yes.

1505 Q. You say that the Klamath Mills have been able to operate profitably?

A. Yes; most of them.

Q. And it is a fact that they have been on one railroad only, all of these years, until the last three months?

A. That is correct.

Q. Now tell us a single mill in western Washington that is not on tidewater, and regardless of the number of railroads it is served by, that has operated profitably in the last few years; a fir mill? Either Oregon or Washington. (2806.)

A. I would say that Inman-Poulsen has made money. They are on tidewater and served by all the railroads that enter Portland. I can't name a single fir mill in either Oregon or Washington not on tidewater that has been very proud of their record, whether it has one railroad or four, offhand. It is true that old-established institutions, like the Peninsula Lumber Company, with access to all of the railroads in Portland and with tidewater, have been unable to make it go. It is a mill without timber for one thing. Maybe that is one of its handicaps. It has had access to the Willamette and Columbia River (2807) log markets. Many of those mills are buying logs right along in that market. Otherwise there would not be any log market.

Recross-examination:

If I were going into the business of manufacturing fir lumber, with my knowledge, and made an investment in a mill, if it were a fir operation I would want tidewater first of all and then railroads would come next; if I didn't have tidewater, two or more railroads would be preferable.

Q. And last of all you would choose a location where it (2808) was served by only one railroad, or would you choose such a location to go into the manufacturing business at all, before you had

1506 made an investment? If you had a quarter of a million dollars to invest and you wanted to go into the lumber manufacturing business and manufacture fir lumber, would you consider investing your money at all to manufacture fir lumber, if you could not get on tidewater, or if you had to locate at an interior point served by only one railroad?

A. That might be governed somewhat by the price at which the timber was offered, and the condition of the ground to log on, and a number of factors. Ordinarily I would prefer the tidewater, with other means of transportation. But there might be cases where that other form of investment might work out all right, if everything were cheap enough.

Q. If you were a manufacturer of fir lumber, would you deem it in your interest to use the shortest rail routes to consuming markets, assuming you were an interior mill and could not ship by water, and the route that would afford you the quickest time in transit for your products?

A. I think the average lumberman would be more interested in the rate he pays than a few miles, more or less, that the traffic would travel. But if he were seeking some particular form of service he might want it to go as direct as possible.

Leaving the rate question out, since (2809) there is the same rate from a very large area of origin to any particular destination in the East, if I were manufacturing fir lumber at an interior point where I could not ship by water, with the information and knowledge I have, it would be preferable to use the shortest rail route to get my products to market and the route over which I could get the quickest time in transit.

Redirect examination:

If I had an interior mill and two railroads and all my shipments went to Chicago and one of the railroads was 200 miles longer,
1507 I would not give all the business to the shorter line. I think it would be a good idea to divide up the business. I think your service would be improved in both respects. (2810.)

H. E. Lounsbury was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am general freight agent of the Oregon-Washington Railroad & Navigation Company. My railroad employment dates back to 1887, when I entered the service of the Oregon Railway & Navigation Company and in 1891 obtained employment with the Southern Pacific Company in the general manager's office where I was employed until 1895, when I was transferred to the traffic department of the Southern Pacific Company Oregon lines. When the Union Pacific merged with the Southern Pacific, in the year 1901, I was traveling freight agent of the Southern Pacific Company out of Portland and covered the territory in western Oregon. A year prior to decision of the Supreme Court dissolving the merger of the two lines, I was appointed general freight agent of the Southern Pacific lines in Oregon, the organization of the two systems being changed (2811) whereby a separate set of officers was established for each system. At the time the decision dissolved the two systems, and in the latter part of 1912, I was appointed general freight agent of

the Oregon-Washington Railroad & Navigation Company and have since acted in that capacity. I have been over this central Oregon territory.

The lines of the Oregon-Washington Railroad & Navigation Company are shown on map which has already been produced. During the period of consolidated operation, the line to the north extending from Portland to Grays Harbor and to Tacoma and Seattle was projected and completed, and operation of same com-
1508 menced in 1910; and during this same period of consolidated operation the Oregon Eastern Railway Company was organized in 1905 for the construction of a line across the State of Oregon from Vale to Natron, near Eugene, from where it would connect with the projected line from Eugene to (2812) Marshfield. Construction was commenced on this cross-State line west from Vale and east from Natron, and to connect with this cross-State line construction of a line north from Klamath Falls on the Oregon eastern survey was prosecuted.

In the year 1909 construction by the Des Chutes Railroad Company, a subsidiary corporation, was commenced from a point of connection with the O. R. & N. at Sherman, on the main line, and proceeded south for Bend. This line was completed to Bend, and opened for operation in the year 1911. 95.30 miles of it are owned by the Des Chutes Railroad Company and 53.14 miles of our Des Chutes line are owned by the Oregon Trunk Railway but are under joint operation for a period of 999 years from May 17, 1910, the Oregon-Washington Railroad & Navigation Company operating the entire line from Sherman Junction to Bend. There is a lease from the Des Chutes Railroad and contract with the Oregon Trunk to the O.-W. R. & N.

The line from Malheur Junction, near Ontario, was completed to Vale and opened for operation in the year 1906, and construction from Vale west on the Oregon Eastern survey commenced in August, 1911, and was completed to Riverside, a point 91.2 miles westerly from Malheur Junction, in the year 1913. This line is of high-class construction and entailed (2813) heavy expense, many miles of same being through the Malheur Canyon and many crossings of the Malheur River being involved.

When this cross-State line was conceived, the traffic eastbound and westbound for Portland and the points in western Oregon north of Ashland was routed over the Oregon Railroad & Navigation Company to and through Portland instead of via Roseville
1509 and Ogden. With such operation and routing and with the extension of the line north to Grays Harbor and Seattle, it was appreciated that congestion of the Portland terminals was inevitable, and it was determined that such congestion could be avoided by routing east and westbound traffic originating and destined to points in western Oregon over a line across the center of the State, and it was thought that the line south of Klamath Falls would also

facilitate the movement of the north-and-south business. In the then existing situation, it was determined that this proposed line across the State could be sustained and justified.

In 1910 the Oregon-Washington Railroad & Navigation Company was organized, and into its organization were merged the parent Oregon Railroad and Navigation Company and numerous branch lines constructed under individual charters, and the line north from Portland to Grays Harbor and Puget Sound points, and at about that time there was conveyed to the Oregon-Washington Railroad & Navigation Company all the rights and surveys east of Odell and all of the branch lines except the Des Chutes branch, (2814) which is still owned by the Des Chutes Railroad Company but operated by the Oregon-Washington Railroad & Navigation Company, and at about the same time the line from Natron through Klamath Falls, partly constructed, was conveyed to the Central Pacific Company.

It therefore came about, with the unmerging of the Union Pacific system and the Southern Pacific system, that the cross-State line from Vale west terminated at Odell junction, near the foot of the eastern slope of the Cascade Mountains, without any access to the terminal at Portland or to the very productive and large consuming territory in western Oregon.

In this situation the Oregon-Washington Railroad & Navigation Company completed its line west to Riverside and stopped construction at that point. Later, in the hope that the Harney Valley might become reclaimed and settled and to the end that more traffic
1510 might be obtained for this line from Malheur junction to Riverside, the Oregon-Washington Railroad & Navigation Company extended the line 33.9 miles from Riverside to Crane, and this extension was opened to traffic in 1916.

Subsequently the Oregon-Washington Railroad & Navigation Company took necessary action to empower it to extend its line from Crane to Burns and it obtained authority from the Interstate Commerce Commission for the construction and built the extension 30.2 miles to Burns where by its articles (2815) of incorporation its line from Ontario junction terminates. It also relinquished to Federal Government all Government rights of way west of the Ontario-Burns line.

This extension from Crane to Burns was completed and opened for operation in December, 1924. Its purpose was to serve a large lumber milling operation at Burns but the mill has not been completed and the anticipated lumber traffic has not yet materialized.

Shortly after the time when the Union Pacific and the Southern Pacific were unmerged, the Southern Pacific reformed its traffic whereby to route the east and west transcontinental business originating from and destined to points in western Oregon through Ogden and the Roseville gateway, and this action, of course, removed the possibility of serious congestion at the Portland terminals, and with other considerations suggested rendered it impossible for the

cross-State line to look to western Oregon for traffic to sustain its operating costs, maintenance, and investment. (2816.) As to what the tariffs were before they were reformed, before the Southern Pacific and Union Pacific were merged, speaking with reference to lumber rates were in effect, that is on class and commodities other than lumber, through the Portland gateway and through the Ogden and Roseville gateways. There was, however, no rate on lumber from Southern Pacific-Oregon lines, no through rates, via the
1511 Portland gateway. The rates applied through the Roseville and Ogden gateway. After the merger took place all of the transcontinental rates, applying through the Ogden-Roseville gateway, were canceled from the tariffs and established through the Portland gateway. So that all of the traffic originating and destined to points on the Southern Pacific lines in Oregon moved through the Portland gateway until after the lines were dissolved, that is after they were unmerged.

Comr. McManamy. At that time the Southern Pacific lines in Oregon were operated by the O.-W. R. & N. or the O. R. & N., as it was at that time, were they not?

A. Joint operation; yes. As far south as Ashland. (2817.) It was under the same general officers, with headquarters at Portland. That covered the period about 1901 to 1912. I became general freight agent of the Southern Pacific in September, 1912, and prior to that time there was no separate general freight agent for the Southern Pacific-Oregon lines.

There have been many changes taking place since this cross-State line was conceived. As stated, during the years of the merger, that the merger was in effect, the eastern traffic to and from western Oregon was routed and handled through Portland. Following the separation of the Union Pacific and Southern Pacific transcontinental rates were reestablished (2818) via Roseville and Ogden. The Spokane, Portland & Seattle Railroad, owned jointly by the Northern Pacific and Great Northern, was completed into Portland in 1908, subsequently taking over the electric line into Salem and extending to Eugene in 1911.

There were no through joint rates on lumber to the East from points on Southern Pacific-Oregon lines via Northern Pacific and Union Pacific were merged. But after the separation, Great Northern through Portland during the period that the South-
ern Pacific and Union Pacific were merged. But after the
1512 separation, and following the entrance of the so-called Hill lines into western Oregon, through joint rates on lumber have been established from the Southern Pacific-Oregon lines, Leona and north—Leona is really about the divide between the Willamette and the Umpqua Valley to all eastern destinations. Leona is between Cottage Grove and Roseburg.

Through joint rates have been established from the Southern Pacific-Oregon lines, Leona north to all eastern destinations through Portland and the Spokane, Portland & Seattle Railway and its con-

nections, also through Portland and the Northern Pacific and Great Northern direct, so that the lumber shippers can now route traffic to the east via all lines serving the Portland gateway.

The Panama Canal was opened for operation about 1912, and the development of canal traffic since the war has been (2819) rapid causing a very substantial loss of transcontinental business to the rail lines.

At the time when the construction program outlined under the joint operation was adopted, the heavy tonnage was east and westbound through traffic and very greatly preponderated the north and south business. Now since the canal has taken away so much of this east and west business, large additional investments to handle it can not be justified for the operations during the past few years indicate a very serious decreasing tendency in its volume. The movement to and from coast terminals reached by the O.-W. R. & N., routed through the canal, for the years 1921 to 1927, inclusive, has been approximately as follows:

These figures are taken from the port reports of Portland, Tacoma, and Seattle and do not include Astoria and Longview.

Eastbound, 1921—this is merchandise, not including lumber—174,269 tons; 1922, 299,001 tons; 1923, 454,491 tons; 1924, 314,272 tons; 1925, 344,582 tons; 1926, 370,620 tons; 1927, 378,351 tons.

1513 Westbound, 1921—141,299 tons; 1922, 358,801 tons; 1923, 542,699 tons; 1924, 462,008 tons; 1925, 521,471 tons; 1926, 568,629 tons; 1927, 568,314 tons. (2820.)

I have similar information for the lumber tonnage from Northwest ports for the same period eastbound: 1921, 211,000,000 feet; 1922, 665,844,090 feet; 1923, 925,134,535 feet; 1924, 1,264,854,180 feet; 1925, 1,701,342,798 feet; 1926, 1,988,911,739 feet; 1927, 1,919,668,928 feet.

Eastbound movements mean to the Atlantic coast and the eastbound movement via the canal to the Atlantic coast and the Gulf of Mexico.

Westbound figures are the canal movements from the Atlantic coast and the Gulf of Mexico through the canal to the Portland and Puget Sound ports. Westbound is incoming and eastbound is outgoing at Portland and Puget Sound.

Included in above figures covering eastbound movement via the canal to Atlantic coast from Northwest ports are shipments from British Columbia ports. Eliminating the shipments from British Columbia ports leaves the following movement from the ports in the State of Oregon and Washington: 1921, 205,973,429 feet; 1922, 605,057,011 feet; 1923, 771,852,581 feet; 1924, 1,027,046,030 feet; 1925, 1,375,023,957 feet; 1926, 1,613,138,155 feet; 1927, 1,625,107,499 feet.

The eastbound lumber movement from Oregon and Washington (2821) ports via the canal for the year 1926 reduced to carloads on basis of 25,000 feet to the car would be 64,525 carloads.

Following is a statement of the lumber shipments to California by water from the States of Oregon and Washington for the years 1924, 1925, 1926, 1927.

This is coastwise movement from the Oregon-Washington ports going south.

Year 1924, Oregon 566,835,907 feet, Washington the same
1514 year, 1,054,993,002 feet; total 1,621,828,909 feet; 1925, Oregon, 610,147,835 feet; Washington, 1,063,051,114 feet; total, 1,673,198,949 feet; 1926, Oregon, 578,335,057 feet; Washington 1,084,583,624 feet; total, 1,662,918,681 feet; 1927, Oregon, 559,957,095 feet; Washington, 949,105,095 feet; total, 1,509,062,190 feet.

The coastwise lumber movement from Oregon and Washington ports to California during the year 1926 reduced to cars on basis of twenty-five thousand feet to the car (2822) would be 66,516 cars.

Exam. ROGERS. Have you got the corresponding rail movement east, of those classes, that is eastbound and westbound and to California during the same period.

Mr. SPENCER. I think that all shows in Wiggins' exhibit, doesn't it?

Exam. ROGERS. I don't know.

The WITNESS. Well, from off the Southern Pacific. I have made some analysis, as far as our line and the Southern Pacific is concerned, which will be later in this report.

Exam. ROGERS. That is what you would need, isn't it, to back up against those figures?

A. I undertake later on in this statement here to make some comparisons.

Mr. SPENCER. It shows the purpose. I don't know how persuasive it may be considered.

Exam. ROGERS. The purpose of it is to show the changed condition since this line was projected across the State. If even with this canal movement there is a greater movement by rail than there was then, it does not show that at all?

The WITNESS. I can show you some decreases, Mr. Examiner.

1515 Mr. SPENCER. It shows business that would have been—the cross-State line was located in 1906 and 1907, Mr. Examiner, and the canal opened in 1912, and the business going (2823) by the canal was obviously the business that the cross-State line was to take care of.

Exam. ROGERS. Well, it may be obvious to you, but it is not obvious to me at all. There may be a greater movement now by rail than there was then.

Mr. DEY. That may be, but then the railroad was not justified then for the then business, but it was looking into the future, expecting to handle this increase in lumber business that was to come.

Water shipments from ports in Oregon and Washington exported to foreign countries, also Alaska, the Hawaiian Islands, the Philippine Islands and Panama Canal Zone for the year 1926
1516 amounted to 1,571,264 feet, and in 1927, 1,164,229,171 feet; and the 1926 figure reduced to carloads on the same basis as before would be 62,850 carloads. (2824.)

Summarizing the above figures shows a total movement of lumber by water from Oregon and Washington ports for the year 1926 of 4,847,320,036, that equivalent to 193,891 cars.

I haven't any figures to show to what extent the water movement to California points moved east after it reached those points from Oregon and Washington ports, but from my experience with the situation I would say that none of the Oregon lumber moves east that goes down the coast after it reaches California. There is some movement from California north Pacific coast ports that moves into the California ports and then east, because there are arbitraries applying from those points to San Francisco and Los Angeles in connection with rail rates beyond. But there is none from Oregon or Washington. The total cut of lumber in the States of Oregon and Washington for the year 1926 was approximately twelve billion feet, so that the water-borne movement amounted to forty per cent of the total cut of the two States, and that total cut includes east of the Cascades, also. (2825.)

Mr. SPENCER. Mr. Lounsbury, you were asked the available corresponding figures for the rail movement as compared with this increase with the water movement. Have you that data to call to the attention to the examiner in the exhibit furnished by Mr. Cornwall? Perhaps that might meet the inquiry made. I don't know whether it does or not.

A. I notice by reference to Exhibit 53 that on the first page Mr. Cornwall shows the production by States for the years 1920 to 1926, inclusive.

Comr. MCMANAMY. That only applies to lumber. My inquiry went to all tonnage. That is the way I understand it. If it is in the record, why, we won't need to consider it further.

1517 I would like to call attention to page 2 of the last tabulation of percentages of rail and water shipments from 1920 to 1926, which corresponds with the last figures that I gave. For example, the production, total production, Oregon (2826) and Washington, for 1926, is shown—I gave it as twelve billion feet, and this total corresponds with that. I also stated that the water-borne traffic was 40 per cent of the total, and this corresponds with that, because it shows from Oregon and Washington by rail there is 52 per cent from Washington, 71 per cent from Oregon, which would average 60 per cent.

When the east and westbound business destined to and originating from Portland and points in western Oregon is analyzed it will be found that the Oregon-Washington Railroad & Navigation Company handles several thousand cars less of this business per month now than it enjoyed at the time the lines were unmerged, and the Oregon-Washington Railroad & Navigation Company, as shown by its statement, is actually suffering for the need of this business and has more than ample facilities to take care of it efficiently in very greatly increased value.

During the first eleven and one-half months of Federal control, namely, January 1st, to November 15, 1918, the Southern Pacific Oregon lines delivered to Union Pacific, Portland, destined east to Ontario, Oregon, 8,310 carloads of forest products, as compared with 2,256 carloads during the year 1926. That was in 1918.

West bound from territory east of Ontario, Oregon, destined to points on the Southern Pacific-Oregon lines the Union Pacific, Oregon-Washington Railroad & Navigation Company (2827), delivered to the Southern Pacific at Portland during period January 1st to November 15th, 1918, 1,350 carloads of all commodities, as compared with 935 carloads in 1926.

1518 Existing conditions dictate and demand that this traffic from and to western Oregon be interchanged with the Southern Pacific at Portland, and there is no reason or inducement for interchanging it at Crescent Lake or any other point of connection with the so-called Natron cut-off. The mileage from Eugene to Portland is 123 miles on a water-level grade.

The mileage from Eugene to Crescent Lake is 96 miles, over a mountainous grade.

By far the heaviest traffic originating or that will originate in western Oregon is lumber, and during the year 1922 the lumber traffic originating on Southern Pacific-Oregon lines destined to Utah and points east thereof delivered to the Union Pacific system lines, including the Portland gateway, amounted to 290,577 tons, and was divided at the interchange points, Portland and Ogden gateways, as follows:

At Ogden, 204,044 tons (2828); at Portland, O.-W. R. & N., 86,533 tons.

Of this total movement 175,521, or 60 per cent of the tonnage originated at points Albany, Corvallis, and north thereof, including Yaquina and Mill City branches from which the main line haul to Portland is 80 miles.

Following is a statement of the carloads and tonnage of lumber and forest products originating on Southern Pacific-Oregon lines, except Klamath Falls line, and destined to points to which rates apply via Portland or Ogden gateways:

Year 1922, via Portland, 86,533 tons; via Ogden, 204,044 tons; year, 1923, via Portland, 2,553 cars, containing 80,019 tons; via Ogden, 8,353 cars, containing 267,860 tons; 1924, via Portland, 2,164 cars, containing 61,364 tons; via Ogden, 8,695 cars, containing 262,803 tons; 1926, via Portland, 2,256 cars, containing 84,256 tons; via Ogden, 13,844 cars, containing 449,930 tons. I did not have the 1925 figures. I made this up to 1924 for the other case, and then I show in comparison 1926. (2829.)

1519 You will note that during the years from 1922 to 1926 there has really been a decrease in the movement of lumber and forest products from off the Southern Pacific-Oregon lines destined east via the Portland gateway, while there has been an increase during that period through the Ogden gateway.

The Southern Pacific will receive freight at Portland from the Oregon-Washington Railroad & Navigation Company consigned to points south of Leona. They don't insist on having it interchanged at Portland. Our transcontinental rates are in effect through the Portland and Ogden gateways to all points on the Southern Pacific-Oregon lines, Ashland and north, on the same basis, both east and west.

All other carload commodities, except lumber, originating on Southern Pacific-Oregon lines, except Klamath Falls line, and destined to points to which rates apply via Portland or Ogden gateways were as follows (2830):

In 1922, via Portland, 4,331 tons; via Ogden, 34,259 tons; 1923, via Portland, 319 cars, containing 5,772 tons; via Ogden, 3,792 cars, containing 67,875 tons; 1924, via Portland, 700 cars, containing 12,148 tons; via Ogden, 2,964 cars, containing 51,275 tons; 1926, via Portland, 1,208 cars, containing 17,211 tons; via Ogden, 3,226 cars, containing 53,196 tons. The destination of those last cars is east of Ogden, which could be routed either through the Ogden or Portland gateways and were destined east. I do not know who routed them. it may be routed by the shipper, the consignee, the broker, or whoever handles the business.

The increase in movement via Portland is occasioned by the routing of broccoli from Douglas County and celery from Marion County to eastern markets. The increase in 1924 and 1926 is due to the movement of broccoli and celery. (2831.)

1520 The westbound carload tonnage, including freight of all kinds, except lumber, from eastern territory destined to points on the Southern Pacific-Oregon lines, except Klamath Falls line, to which rates apply via Portland or Ogden gateways delivered to the Southern Pacific at Portland for the years 1922 and 1926, was as follows: 1922, via Portland, 22,144 tons; via Ogden, 5,312 tons; 1926, via Portland, 935 cars, 22,806 tons; via Ogden, 966 cars, 17,694 tons.

The bulk of the tonnage moving westbound via Portland consists of coal from Utah and Wyoming, and corn from Nebraska and other eastern States.

In the year 1922 the tonnage of corn was 6,302 tons, and coal 15,634 tons.

In the year 1926, the coal from Utah and Wyoming amounted to 248 cars, the corn from Nebraska, and so forth, 235 cars, or a total of 483 cars.

The western movement of corn delivered to the Southern Pacific at Portland in 1927 for all of western Oregon was 246 cars.

I desire to emphasize that the lumber movement from Oregon and Washington ports during (2832) the year 1926 approximated 193,891 carloads.

Exam. ROGERS. Can you tell us why the Union Pacific did not bring that traffic around through Portland that they did deliver to the Southern Pacific at Ogden?

A. It was routed that way.

Exam. ROGERS. By whom?

A. By the shipper or the consignee.

Exam. ROGERS. Well, do they bring freight around through Portland that is unrouted?

A. Well, the unrouted business, if it is routed Union Pacific system, routes through Portland, but if it is routed Union
1521 Pacific-Southern Pacific without designating the gateway I believe that would go to the Southern Pacific at Ogden, because it doesn't specify Union Pacific system lines.

Exam. ROGERS. Well, Union Pacific Railroad-Southern Pacific Railroad.

A. I want to say that there is very little of that unrouted business. The shipper or consignee routes his traffic. I don't think you would find a half dozen cars a year unrouted. (2833.) I believe that eastbound as well as westbound the billing will show the through routing.

Exam. ROGERS. The shipper routes both ways?

A. Yes, sir; I might state, just along that line, that a great deal of the westbound tonnage, particularly merchandise tonnage that moves into this western territory, particularly this northwestern territory, is eastern controlled, that is, it is controlled by the traffic manager of the manufacturing house, like United States Steel, and the American Steel and Wire, and the implement houses and factories that employ traffic managers. They divide up the percentages of westbound traffic via the westbound lines, the trunk lines, to carry over the year. Many of them are governed in their division of traffic by purchases from those lines. The Union Pacific and Oregon-Washington Railroad & Navigation Company suffer in this territory by reason of the fact that our percentage of that business (Union Pacific system) the heavy percentage of that division of tonnage westbound, goes to California.

Comr. MCMANAMY. Well, I was just wondering why a car of merchandise consigned to Roseburg Union Pacific-Southern Pacific can be interchanged at Ogden.

Exam. ROGERS. You mean when it is unrouted?

Comr. MCMANAMY. Yes; now, there are evidently many of (2834) such shipments, according to your figures.

1522 Q. There isn't any other junction, is there?

A. There is either the Ogden gateway or the Portland gateway.

When the shipments are routed by the system lines—that is, if it would be Union Pacific system-Southern Pacific it would be turned over to the Southern Pacific at Portland, but the shipper usually specifies the gateway. The billing usually shows where the shipment should be made.

Exam. ROGERS. Well, if the billing shows Union Pacific-Southern Pacific, as I get your explanation, you construe "Union Pacific" as Union Pacific Railroad, not the Union Pacific system?

A. Yes, sir; well, I think that the Southern Pacific would construe it that way, too. That is, there is no more reason why they should

come around through the Portland gateway as against the Ogden gateway. That would be a guess on my part.

Comr. McMANAMY. Well, for the purpose of illustration—suppose we have a car of merchandise consigned to Santa Barbara, Union Pacific (2835) Southern Pacific, would that also be turned over to the Southern Pacific at Ogden?

A. Yes, sir.

Comr. McMANAMY. In spite of the fact that the Union Pacific has a line to Los Angeles within 160 miles of Santa Barbara?

A. I don't understand that rates applied through the Los Angeles gateway to Santa Barbara.

Comr. McMANAMY. Well, there isn't, you say?

A. Yes.

Mr. McCULLOCH. Mr. Commissioner, may I ask if Mr. Lounsbury could answer the question if it applied to a point on the Southern Pacific just south of Los Angeles to which probably there would be rates via that route?

A. The same answer applies; it would.

1523 The number of carloads of lumber and forest products originating on Southern Pacific-Oregon lines, except Klamath Falls line, and destined to points Ogden and east for the year 1926, was 16,100 cars, of which 2,256 cars moved via the Portland gateway.

The total number of carloads of lumber and forest products moving east via long haul through Huntington and Union Pacific system lines from mills on the Oregon-Washington Railroad (2836) and Navigation Company and connecting lines for the year 1926 amounted to 38,798 cars, so that this information would indicate that the movement handled east originating on the Oregon-Washington Railroad & Navigation Company and its connections was considerably smaller than that handled by water from Oregon and Washington ports, either via the Canal or California, or to foreign ports, as shown by these figures that I gave.

From this it will be seen that the all-rail movement via Union Pacific system lines through Huntington and from Southern Pacific-Oregon lines points, except Klamath Falls branch via Ogden and Portland approximated 11½ per cent of the total cut of the Oregon and Washington product for the year 1926, and only 28 per cent of the total movement by water from Oregon and Washington ports for the year 1926.

To get that 11½ per cent, it is necessary to add to the number of cars originating on the Oregon-Washington Railroad and Navigation Company and its connections the total number of cars originating on the Southern Pacific-Oregon lines, except the Klamath Falls branch, which made a total of 54,994 cars.

Now, I may add there that this 54,994 cars for 1926, which includes the total number of cars of forest products originating on the Southern Pacific-Oregon lines which went east of Ogden either via the

Portland or Ogden gateway, and all of the cars originating on the Oregon-Washington Railroad & Navigation (2837)
1524 Company and connections which went through the Huntington gateway, doesn't amount to the number of carloads that move north through the canal to the Gulf and Atlantic ports, and it doesn't amount to the number of carloads that move from Oregon and Washington ports to California coastwise.

The canal was opened in 1912.

Exam. ROGERS. Well, I was just wondering, if, as I understand the point of the canal testimony is, and your testimony about the canal, that that is a condition which arose—

A. Subsequently.

Exam. ROGERS. Subsequent to the thought of the Union Pacific about this line.

A. Yes.

Exam. ROGERS. But I was wondering if the Union Pacific (2838) in putting a line across the State in—What? 1912?

A. No, sir.

Exam. ROGERS. What?

A. That was started around 1906.

Exam. ROGERS. That was about the time the canal started? It was testified that it was started in 1907.

A. Nobody could conceive that the canal was going to take the Pacific coast and Atlantic coast business practically all away from the railroads, which it is doing. Right along that line I would like to tell you that the railroads are not transporting any rough lumber to-day from the Pacific coast to the Atlantic coast. What we are handling now is the finished lumber, and even finished lumber and doors can be handled by water.

Exam. ROGERS. Well, didn't you transport the rough lumber before the canal was built?

A. Yes, sir; there was no movement via ater to the Atlantic coast before the canal was finished. Even merchandise moved around through Tehuantepec.

1525 Exam. ROGERS. Was there a movement of rough lumber by rail?

A. Yes, sir; timbers and green lumber and rough lumber.

Exam. ROGERS. I was really laboring under a misapprehension. I had in mind that this line was (2839) projected in 1912 or '13.

A. That was the time of the dissolution. The Oregon-Eastern was organized in 1905.

Exam. ROGERS. That was really before the canal was begun to be constructed. That was in 1907.

A. Yes, sir; and at that time all of the lumber originating in western Oregon on the Southern Pacific-Oregon lines was moving through the Portland gateway, under the merger, and, as there was no canal movement, as our line was completed to Puget Sound and Grays Harbor in 1910 we figured on handling a tremendous tonnage

originating north of Portland in the Puget Sound territory and this western Oregon tonnage, as well as all the Portland tonnage, through the Portland gateway.

Mr. SPENCER. Is that Grays Harbor, too?

A. Yes, sir; Well, now we can take all the traffic that originates in western Oregon through the Portland gateway and then not be congested, and all the rest of the traffic that originates north of Portland that we can get, to the East.

Exam. ROGERS. You mean you can handle, in addition to what you are handling all that originated by the Southern Pacific through the Portland gateway?

A. Yes, sir (2840); very nicely.

Exam. ROGERS. Well, if that can be arranged it will be all right, will it?

A. Quite satisfactory. I have a compilation here which I took from Abbey's Register, showing the number of mills and production of lumber in Oregon and Washington, which I think I will leave out, as that will be a duplication of the figures submitted in Exhibit 53.

1526 Exam. ROGERS. Go ahead and put them in. Let's see what they show.

A. Oregon and Washington, the year 1922: Oregon, number of mills 436, production 3,023,768,000 feet; Washington, number of mills 538, production 5,836,277,000 feet.

1923: Oregon, number of mills 527, production 3,966,083,000; Washington, number of mills 597, production 6,677,656,000 feet.

1924: Oregon, 660 mills, production 3,665,547,000; Washington, 648 mills, production 6,267,343,000. (2841.)

1925: 651 mills, that is Oregon, production 4,216,383,000; Washington, number of mills 623, production 7,027,325,000.

1926: Oregon, mills 653, production 4,454,735,000; Washington, mills 632, production 7,546,239,000.

Exam. ROGERS. That is quite a discrepancy between your mills and that on Exhibit 53, although the production is about the same.

A. I imagine that it is a very difficult matter to keep track of the mills, inasmuch as there are increases, and there are some mills that have been abandoned.

Exam. ROGERS. You have got over 600 in Oregon in 1926, and Mr. Cornwall has 460. (2842.)

A. Well, I don't know how they get the figures. I asked the Abbey's Register to prepare that for me. They have a regular lumber publication which shows the list of mills. I can take that register and figure out more mills from that than I have shown here. They give a list of all the mills and where they are located, and some of them are no doubt obsolete and have been for some time, and I imagine that some of the mills that are listed on their pages have probably been burned and some of them have cut out the timber and moved away, and they show small mills as well as large mills,

and there are a number of small mills, portable mills, that move around.

Production of lumber output in the States of Oregon and Washington has been very substantially increased during the past
1527 few years by the construction and operation of large mills at Vernonia, Oregon, and Longview, Washington.

The Oregon-American Lumber Company's mill at Vernonia was completed and began operation in July, 1924. It has a capacity of 350,000 feet in one shift of eight hours, and by working two shifts would produce 700,000 feet per day. We understand they are now operating two shifts.

The Long-Bell mill at Longview has a capacity of 1,220,000 feet per eight-hour shift, divided as follows: 600,000 feet, rough lumber; 400,000 feet, dressed lumber; 110,000 feet, lath (2843); 100,000 feet, shingles; 10,000 feet, mouldings. The Long Bell has two mills; they have double operation.

Exam ROGERS. What was your daily capacity?

A. 1,220,000 feet. Eight-hour shift.

Exam. ROGERS. Mr. Cornwall gives 850,000.

A. I think he gave that just for the mill alone.

Exam. ROGERS. No; he has given two mills.

A. No; I mean for the cut, lumber cut. These figures that I obtained through our representative, who makes that territory all the time. I asked him to give me the cut of the mills.

Exam. ROGERS. What I was concerned about, where there is such a wide discrepancy in data purporting to show the same thing, which are we going to rely on?

A. Well, that is the largest operation I know of in this territory. I will submit the exact figures, Mr. Examiner. (2844.)

This mill was completed and began operations July 31, 1924. In addition thereto the Weyerhaeuser Company have announced construction of a mill operation at Longview with capacity
1528 to manufacture 800,000 feet in one eight-hour shift.

There has been a very marked increase in the past few years in the growth of substitute building materials displacing lumber in the markets to a great extent.

In a pamphlet entitled "Memorial to the Railroads of the United States by the Lumber Industry," printed and distributed by National Lumber Manufacturers' Association pursuant to an understanding reached at meeting in Chicago, Illinois, on July 23, 1926, the following data under heading "Growth of Substitutes" is submitted:

"The great growth in substitute building materials from 1919 to 1925 is shown in Exhibit 1" of the pamphlet—largely prepared from reports by the U. S. Census Bureau. It will be noted that while softwood lumber production increased only 15.7 per cent and hardwood production decreased 7.2 per cent the growth in substitute materials ranged from 131.4 per cent to 1,125 per cent. The output of hardwood lumber, wooden shingles, maple flooring, and the amount of lumber consumed in box manufacture are the only items of the 30

listed which showed a decrease from 1919. The great increases were shown by fibre board, 1,125 per cent, which displaces large quantities of lumber; prepared roofing 131.4 (2845) per cent; wall board, 581 per cent; box board, 154.6 per cent; and paper shipping boxes, 109.9 per cent.

"As illustrative of the loss in lumber tonnage to the carriers resulting from the displacement of lumber by fibre boards, the following table shows the increased production of one of the fibre boards, Celotex, during the past five years from 12,000,000 square feet in the year 1922, to a production of 220,000,000 feet in 1926, or an increase of 1,733.3 per cent. This material loading in standard cars only about 34,560 pounds or 57,600 square feet, gave the carriers in 1922, approximately 208 cars of revenue traffic and in 1926, approxi-
1529 mately 3,819 cars. This fibre board to a large extent takes the place of lumber. About 850 square feet, its vendors allege, will displace 1,200 board feet of lumber, or a ratio of about 1 to 1.4. With lumber loading 20,000 board feet to the car, it will be noted that the 3,819 cars of this fibre board alone cost the carriers 15,400 cars of lumber traffic in 1926, and 32,778 cars over the period 1922–1926." (2846.)

The exhibit shows the production of Celotex for 1922, 12,000,000 square feet. 1926, 220,000,000, which is 1,833.3 per cent. Number of cars replaced, 3,819. 1927 is estimated here at 360,000,000 for 6,076 cars.

The fibre board known as Celotex manufactured in the south made from sugar and cane fibre, and is converted into a pulp and finished as a fibre board.

We are informed that there is ample supply of raw material and that the increase in the manufacture of this product is sufficient to take care of any increased demand therefor.

In considering this cross-State line of the O.-W. R. & N. terminating at Crescent Lake, we are compelled to take note of the Southern Pacific's relation to this western Oregon country. Its main lines and branches reach the districts and the points where (2847) the traffic originates and where it is delivered. It has expended over $15,000,000 in completing the so-called Natron cut-off from Eugene through Klamath Falls to Weed.

It is not conceivable that that company will voluntarily short-haul itself and deliver at Crescent Lake traffic that it can haul and deliver to the Union Pacific at Ogden or vice versa.

It may be said that with the great increase of business north and southbound serious congestion might take place through the Roseville gateway, necessitating diversion at Crescent Lake, but before making any such sacrifice, if such congestion should actually
1530 occur, the Southern Pacific would naturally extend its line through Alturas to a connection with its so-called Natron line at Klamath Falls, and thereby relieve the congestion, or turn over the business to the O.-W. R. & N. at Portland. They have announced

that they intend to do that. They would naturally favor their long haul, and it is inconceivable that under existing conditions the line from Crescent Lake across the State would receive any more traffic from western Oregon originating on the Southern Pacific and going east than it is now receiving through the Portland gateway.

Turning to the central Oregon situation with a view of locating transportation lines to serve that country, we find (2848) that the resources available to substantially contribute to the support of the railroads in that country are located on the east side of the State and consist of timber to the north of Burns and the Harney Valley to the south of it, and by Harney Valley we would include the Blitzen Valley south of Malheur Lake, and the other resources are in the timber and valleys lying west of line if drawn from Bend to Lakeview.

The situation is graphically reflected upon the key map marked Exhibit 3, upon which north and south lines have been drawn to indicate the west line of the resources in the western part of central Oregon.

Between these two lines is an unproductive country. The projected line from Crane west to Crescent Lake, while traversing some country of possible reclamation and development along the north shore of Harney Lake, enters the area of resources in the western part of central Oregon at its narrowest point and can not possibly serve it with any degree of satisfaction or efficiency. Indeed, the few miles traversed by it in the timbered area is to some extent accessible to the so-called Natron cut-off now under construction.

1531 As to when this statement was prepared by me, I have written and corrected it a number of times. (2849.) Part of it is taken from my statement in the former hearing.

Mr. SPENCER. What about the Great Northern line in that connection, there?

A. The Great Northern line has been constructed now from Bend to Klamath Falls.

Q. Where you go into this timbered area from the east which railroad do you encounter first?

A. You encounter the Great Northern first.

Q. Then the Cascade line of the Southern Pacific?

A. Yes; which is on the west about twenty-one miles.

A line constructed in central Oregon must depend upon the pine timber as its principal resource.

The line constructed from Crane to Burns will serve the timber to the north and it can not be looked to as a resource for the cross-State line because it must move to the east and to the southeast. (2850.)

We are satisfied from our study of the situation that under existing conditions cross-State line as located from Crane to Crescent Lake should not be considered and that its construction would entail a great waste of capital, and that it can not pay its operating expenses and maintenance charges, to say nothing of the taxes and interest on the investment.

The only way whereby the proposed cross-State line could possibly be supported would be to restore its relation to the railroads, their cities, including Portland, towns and their industries in western Oregon, as same obtained when the cross-State line was located and its construction undertaken, which is impossible under existing conditions.

I have personally traversed the central Oregon country in attempting to make a survey and estimate of its traffic possibilities, and have also had a traffic representative travel through
1532 the country, and from the inquiries that I have personally made and that I have had made under my direction think I have a fairly good conception of its traffic possibilities.

From the information I have assembled I have prepared in exhibit form statement of the tonnage and revenue which I consider might be developed with this line contemplated by the Oregon eastern survey if constructed east of Crescent Lake.

In making these estimates I have theoretically constructed (2851) a sawmill at or near mile post 280 on the surveyed line on the Crane-Crescent Lake line with a capacity of 100,000 feet daily. I now present these exhibits for identification. The first exhibit is my estimate of the tonnage and revenue.

(Said statement was thereupon received in evidence, marked "Defendants' Exhibit No. 54, Witness Lounsbury.")

The first sheet is intended to show the estimate of outbound traffic for the first year and the revenue to the Crane-Crescent Lake line from this traffic.

The second sheet contains the estimate of tonnage and revenue for the second, third, fourth, and fifth years.

The third sheet is intended to show the inbound movement.

There are two sheets in this compilation covering the first year, and the fifth and sixth pages are inbound estimate of tonnage and revenue for the second, third, fourth, and fifth (2852) years.

It will be noted that in connection with the outbound estimate I did not show any lumber for the first year, because I did not consider that mill would be completed and in operation the first year, and did not show any revenue for the second year, but began with the third, fourth and fifth years. (2853.)

I do not show any business as received on that cross-State line from the Great Northern Railroad; nor from Bend, Lakeview, or Klamath Falls.

1533 I do show some business from the Southern Pacific inbound. I show some traffic that will move off of that line to San Francisco and Portland and in the opposite direction, some business to and from the valley, but I do not show any through business by that line. This estimate is prepared with the idea of showing the revenue that would accrue to the line from business originating along the line and going off of it and traffic destined to points on the line. I do not include anything for prospective westbound traffic from Idaho.

Exam. ROGERS. Do you conclude from what you heard here there would not be any of that?

A. The business that is originating now and destined to points on the lines in eastern Oregon which we now operate, can continue to move (2855) via the routes now established and in effect. If you take away any of that traffic from southern Idaho and route it across the cross-State line you would take away from the existing lines as much or more revenue than now would be earned by our existing lines from that traffic.

I wish to make a statement with respect to the product of Alkali Lake. In my estimate I have shown no tonnage or revenue from Alkali Lake, but I have figured up, as a result of Mr. Emerson's testimony, what we might expect if there was an operation there at Alkali Lake, and I will submit the following:

Report on "Potash in 1917," by Hoyt S. Gale and W. B. Hicks, taken from Mineral Resources of the United States, 1917, Part II, page 426, published in 1919, and obtained from the Government Printing Office, Washington, D. C., says:

"Preparations were made to carry out a process for separating potash (2855) from the brines in the pool known as Little Alkali Valley, Lake County, Oregon. A sample from this pond
1534 taken in August, 1915, contained 10.63 per cent of dissolved matter, in which potash ran 3.25 per cent as potassium, or 6.19 per cent if calculated as potassium chloride. This is somewhat richer than many of the other natural brines found in the West. The deposit is small, but as the project was carefully planned it has evidently been estimated that a sufficient amount of potash might be recovered to make a profit from the enterprise by using an inexpensive method of recovering the salts. It is stated that some disagreement concerning the method of handling the matter led to the abandonment of the work after it was well under way."

The report on "Salt Resources of the United States," by W. C. Phalen, Geological Survey Bulletin No. 669, page 130, covering Alkali Lake, published in 1919, and obtained from the Government Printing Office at Washington, D. C., contains the following quotation:

"There is a shallow and variable lake of strong brine in Alkali Valley, southern Oregon, which occupies the bottom of one of the typical desert basins of this part of the Great Basin. A notable deposit of soda is found in and around the lake. The alkali occurs as a crust on the surface of mud in and around shallow saline ponds, and there are 'pot holes' (2856) near the margin of the deposit in which almost pure soda crystalizes. These 'pot holes' have been worked for soda in a small way, and the deposit as a whole has been taken up by a company which plans to work it for soda and perhaps for other products. Attention has been directed to this deposit as a possible source of potash.

"Hoyt S. Gale, of the United States Geological Survey, examined this deposit in August, 1915, and took samples of the brine and salts

The results do not seem to indicate that the materials are of
1535 promise as a source of potash salts, though these may be recovered in conjunction with other salines. For example, the brine from a pool known as Little Alkali, which is probably the largest body of open water, carriers 10.63 per cent dissolved matter, in which potash ran 3.25 per cent as potassium, or 6.19 per cent calculated as potassium chloride." It follows the same quotation as was made from the other.

From a statement on "Production of Natural Sodium Compounds and Borates in 1926," published by the Bureau of Mines and issued by the Department of Commerce, Washington, D. C., April 19, 1927:

Mention is made therein of the production of sodium carbonate, soda ash, and sodium bicarbonate, from Owens Lake by the Inyo Chemical Company, of Cartago, California, and the Natural Soda Products Company at Keeler, Calif., as (2857) well as other soda products being produced by the Wyoming Soda Products Company at Green River, Wyo., and by the American Potash and Chemical Company, successor to the American Trona Corporation, at Trona, Calif.

In the report made by Mr. W. C. Phalen, of Mineral Resources of the United States, published in 1917, from which an extract is shown above, statement is made that the content of potash in the Alkali Lake deposit is somewhat higher than that commonly obtained in such brines, but is not comparable, for example, with the brine from Searles Lake in Southern California.

I have, therefore, made a study of the rates applicable on these soda products from Searles Lake, from Keeler, Calif., from Cartago, Calif., and from Trona, Calif., to Los Angeles, Calif., Wilmington, and San Francisco, and observed that the rates on this product are very low. From Keeler, California, to Los Angeles, on soda ash, the rate is 21½ cents, minimum 60,000 pounds.

Mr. McCULLOCH. Have you got those distances that you could give, Mr. Lounsbury, when you give the rates?

1536 A. Yes.

Mr. McCULLOCH. For the first one, that 21-cent rate, what was the distance?

A. The distance from Keeler to Los Angeles is 260 miles (2858), and the rate is 21½ cents, 60,000 pounds.

From Keeler to San Francisco the distance is 577 miles; the rate is 25 cents per 100 pounds, minimum 80,000 pounds.

From Cartago to Los Angeles, a distance of 218 miles, the rate on soda ash is 21½ cents, and to San Francisco, 486 miles, 25 cents.

From Searles, to Los Angeles, a distance of 149 miles, the rate is 21½ cents, and to San Francisco, 417 miles, 25 cents.

I might state that I notice this 25-cent rate in each case to San Francisco applies on intrastate traffic only. They have an interstate rate of 28½ cents.

Now on carbonated soda the rates are identically the same. There is a rate from Keeler, from Cartago and from Searles to Los Angeles—to Wilmington, California, of 17½ cents, minimum 80,000 pounds, on traffic moving beyond Wilmington by water destined to points outside of the United States of America. Rates will also apply on traffic destined to Alaska, the Hawaiian Islands, Panama Canal, Philippine Islands, Porto Rico and Virgin Islands. It will be seen at a glance that these are all low rated commodities, and that for movement from California producing points, such as Keeler, Cartago, and Searles, the rates to Los Angeles, Wilmington, and San Francisco have been equalized, notwithstanding the difference in distance. (2859.)

The distance from milepost 190, the nearest point on the proposed line to Alkali Lake, to Portland is 330 miles, and it is fair to assume that were similar commodities produced at Alkali Lake the
1537 rate to Portland could not exceed the rates from California producing plants to California markets on similar commodities.

Having in mind that Alkali Lake is 18 to 20 miles distant from the proposed line, in consequence of which it will be necessary for the shipper to either haul their product that distance or construct a branch line, the railroad could not expect to secure a freight rate in excess of 25 cents per hundred pounds, or $5.00 per ton, and this rate would have to be divided with the Southern Pacific, probably on a mileage pro rata basis.

As stated, the through distance is 330 miles, divided as follows: Milepost 190 to Crescent Lake, 111 miles; Crescent Lake to Portland, Southern Pacific, 219 miles.

The revenue to the proposed line east of Crescent Lake would be 33.6 per cent.

If such a plant as outlined were to be constructed and ship to Portland two cars per day of 100 tons for 300 days per annum at rate of $5.00 per ton, the gross revenue would be $150,000, of which the new line proportion would be $50,400. Should it produce but 50 tons per day and movement (2860) take place to Portland, the revenue to the new line would be $25,200 per year.

It should be borne in mind that a manufacturing plant very seldom makes shipments to the extent of its capacity until a year or more after it has been established, and the completion of a manufacturing plant to the producing stage requires many months from the time it is conceived and construction started.

1538 PORTLAND, OREGON, *August 18, 1928.*

H. E. LOUNSBURY thereupon resumed the witness stand, and testified further as follows:

Direct examination—Contd.

Q. (By Mr. SPENCER.) Mr. Lounsbury, proceed with the discussion you have and analysis of Teutsch's Exhibit No. 1. Or what is your order?

A. That is the next order I have here.

Under heading "Malheur County," page 1, Mr. Teutsch shows estimate of agricultural tonnage available for movement over proposed cross-State railroad, first item being sheep 184 cars, totaling 1,843 tons. During the year 1926 the total movement of sheep from all points on the Oregon Short Line west of Mountain Home to all western markets amounted to 4,192 tons, of which there was no movement to northern California north of Santa Barbara and Mojave, and less than 1 per cent, or 35 tons, to destinations south of Santa Barbara and Mojave, the balance or practically the entire movement being to Oregon and Washington markets. A separate statement of the movement of sheep originating on the Brogan and Oregon eastern branches for the year 1926 shows no movement to northern California, and 23 tons, or 2 cars, (2862) to southern California south of Santa Barbara and Mojave and 1,973 tons, or approximately 179 cars, to Oregon and Washington markets.

Cattle: Mr. Teutsch estimates 378 cars, or 4,723 tons.

In 1926 the entire movement from Oregon Short Line points west of Mountain Home to Pacific coast markets was 19,986 tons, of which 296 tons, approximating 23 cars or 1½ per cent moved to northern California markets north of Santa Barbara and Mojave and 1,313 tons, approximating 101 cars or 6½ per cent moved to southern California markets south of Santa Barbara and
1539 Mojave, the balance, approximating 1,413 cars, or 92 per cent, moved to Oregon and Washington markets.

Q. (By Mr. SPENCER.) Is the distance from those shipping points to those southern California points substantially in excess of the distance via existing routes to the bay cities, irrespective of whether the Wells line or the Ogden route is used?

A. Well, the distance to the southern California market is shorter via the Salt Lake route.

Q. Well, I know, it moves via the Salt Lake route down to Los Angeles?

A. Yes, sir.

Q. Is it further to Los Angeles?

A. No, sir; it is shorter to Los Angeles via the Salt Lake (2863) route than it would be via the proposed cross-State line.

Q. Well, I wasn't asking you that. Of course it is shorter to Los Angeles via the Salt Lake route than it is via the proposed cross-State line, or via any route through California?

A. Yes, sir.

Q. But I am asking you whether it is a longer haul from the originating point that you have just mentioned in southern Idaho to southern California markets than it is via either Ogden or Wells to San Francisco?

A. Yes, sir.

Narrowing the movement down to the shipments from off the Brogan and Oregon eastern branches for the year 1926, there was

no movement of cattle to northern California north to Santa
1540 Barbara and Mojave, and but 78 tons, or 6 cars, to southern California points south of Santa Barbara and Mojave; the balance 5,501 tons, approximating 423 cars, moved to Oregon and Washington markets.

Hogs: Mr. Teutsch estimates 79 cars, or 786 tons.

In 1926 there was but one car of hogs moved from the entire territory on the Oregon Short Line west of Mountain Home to California destinations south of Santa Barbara and Mojave. There were no hogs shipped to California from off the Brogan and Oregon eastern branches. The balance of 595 cars, approximating 5,061 tons moved to Oregon and Washington markets. (2864.)

Horses: Mr. Teutsch estimates 28 cars, or 308 tons.

The movement from west of Mountain Home on the Oregon Short Line in 1926 was 1,989 tons, of which 14 tons, or one car, moved to northern California north of Santa Barbara and Mojave; 195 tons, or approximately 14 cars, moved to southern California south of Santa Barbara and Mojave; the balance 1,450 tons, or approximately 104 cars, moved to Oregon and Washington markets. The big movement of horses is to Portland to the packing plant located at Kenton. This plant has been operating probably two years. As to whether there are any other plants of that kind on the coast, there is a small plant of that kind now at Klamath Falls, one at Butte, Montana, the one at Butte being comparable with the plant at Portland. There is also at this time a representative of the Russian Government in this territory buying horses for shipment to Russia, and a contract has recently been made for 1,750 head, and those horses will be gathered up to a considerable extent in the eastern Oregon and southern Idaho territory. To my knowledge, there are no horse packing plants down in California. (2865.)

I have prepared a statement showing the present rates on live-
stock from Ontario, Vale, Harper, Crane, and Burns to
1541 Portland via Huntington and to San Francisco via Portland and via Wells, also what the rates would be to San Francisco via Crescent Lake using combination of locals on Crescent Lake.

I might say, in connection with the set of exhibits, that to save time I have separated them all, so that they might be distributed at one time, but I will introduce them as I go along as separate exhibits. Livestock is the first one.

From this statement it will be noted that rates on livestock from Malheur County to San Francisco will be no lower via the cross-State line than via existing routes, and with respect to movement of livestock from Malheur County to Portland and Puget Sound markets the distance from Ontario to Portland is 103 miles shorter than the distance via the proposed cross-State line, in consequence of which rates and distance both favor the direct route through Huntington, so that none of the (2866) traffic for the Portland and

Puget Sound markets will move over the proposed cross-State line. line.

Exam. ROGERS. You say "Via Crescent Lake." That is a combination of locals on Crescent Lake?

A. Yes, sir.

Exam. ROGERS. What do you suppose the through rate will be, the joint rate?

A. The through rate, if established, from Ontario to San Francisco by the cross-State line would be no lower than the Ontario-San Francisco rate by the Wells line, and it might be that the rates via the Oregon eastern branch would be the Ontario-San Francisco rate via Wells held as maximum to intermediate points, if through rates, through joint rates, were established.

1542 Exam. ROGERS. These rates via Wells and the other gateways other than Crescent Lake—are they combination of locals?

A. They are through joint rates.

Exam. ROGERS. That would make quite a difference in the comparison, wouldn't it, as to whether they are combination of (2867) locals or through rates?

A. I have no basis on which to figure a through joint rate via the cross-State line. The statement shows for itself.

Exam. ROGERS. Yes; but the combinations of locals are usually higher than through rates, aren't they?

A. Yes; but the establishment of through rates depends upon a good many conditions.

Comr. MCMANAMY. In the event a cross-State line was built, do you know any reason why there shouldn't be joint through rates established?

A. Except that it would short-haul the present routes, and the division of the through joint rates with the Southern Pacific would give the cross-State line a less revenue than they now receive by the established route.

It would short-haul the Portland gateway, and it would short-haul the Wells-Rogerson gateway.

Comr. MCMANAMY. Which line? For instance, take from Mountain Home, which is your dividing point, assume that it would short-haul the Oregon Short Line, would it not be your understanding, by the Rogerson-Wells cut-off? Assuming the Oregon Short Line would operate the cross-State line, as it now does the Burns branch, would the Oregon Short Line short-haul (2868) itself by delivering to the Southern Pacific at Crescent as compared with the Rogerson-Wells cut-off?

A. From Ontario?

Comr. MCMANAMY. No; from Mountain Home? That was 1543 the point you were using. That is why I used it.

A. Yes.

Comr. MCMANAMY. If you haven't got it there——

A. I haven't got the mileage from Mountain Home to Wells, or Ontario to Wells, fixed in my mind, but my notion is that it would short-haul the Oregon Short Line, but I can determine that point in just a minute.

Mr. SPENCER. Well, I think there is no question but what Mountain Home is practically the equidistant point between San Francisco via the Wells line and San Francisco via Crescent Lake.

Comr. MCMANAMY. I was assuming that that would be the point you would use.

Mr. SPENCER. Yes; it may be a few miles east, at a point—Clift, I think it is——

Mr. GOODWIN. West of Mountain Home a few miles.

Mr. SPENCER. West of Mountain Home—but Mountain Home is the shipping point. I will introduce a table showing (2869) Mountain Home and the distance from all these stations, but I wasn't prepared to do that by this witness.

With respect to the California market I have obtained from the Portland "Morning Oregonian" a comparison of price quotations showing the market prices at Portland and at San Francisco, that is to say, the top price shown on same day of each month of 1927 and the first six months of 1928, which is shown in memorandum submitted as the next exhibit. It is on cattle, sheep, and hogs.

(Said statement was thereupon received in evidence, marked "Defendants' Exhibit No. 56, Witness Lounsbury.")

At certain seasons of the year there is a substantial movement of cattle from western Oregon and northern California to the Portland market and a southbound movement from Portland to the California market. (2871.)

1544 Mr. SPENCER. Wait a minute. I wonder if No. 55 was formally introduced. I desire to have it introduced.

(Said statement was thereupon received in evidence marked "Defendant's Exhibit No. 55, Witness Lounsbury.")

1545 The WITNESS. With respect to that I would like to state at this point that I have a record of the receipts of livestock at the north Portland market for the years 1927 and 1926, showing the receipts from off the railroads of this territory serving the north Portland stockyards.

Union Pacific, 1927, 4,446; 1926, 4,961. That is carloads. Decrease 515 cars. Southern Pacific, 1927, 794 cars; 1926, 573 cars; increase 221 cars.

Portland, Spokane & Seattle, 975 cars in 1927; in 1926, 1404; decrease 429 cars.

Other lines, 1927, 190 cars; 1926, 194 cars; decrease 4 cars.

Toal, 1927, 6,405 cars; 1926, 7,132 cars; total decrease 729 cars.

From this it will be seen that the movement off of Southern Pacific lines in Portland, in 1927 of livestock, shows an increase, over 1926, while the other lines show a decrease.

In connection with this table, Exhibit 56, (2872) there is a difference in the rate from the originating territory to San Francisco and Portland.

As to which destination is higher, San Francisco is, if you are speaking of originating territory on our lines, on the Oregon Short Line and O.-W. R. & N.

Q. Now when that difference in rate is taken into consideration in connection with the prices set forth on this table, is the San Francisco market, generally speaking, any higher than the Portland market?

A. Generally speaking it is higher.

Q. When the rates are taken into consideration?

A. I understand. Generally speaking the Portland market is higher; that is, the price is higher at the Portland market
1546 when you take the rate into consideration. The rate is higher of course to the California market.

Q. I notice on this table there is no dollar sign, but I assume all of these figures here reflect dollars in the different columns, in Exhibit 56—dollars per hundred pounds?

A. Dollars per hundred pounds, or cents per pound. It would be about the same. We quote livestock, on the hoof, dollars per hundred pounds. (2873.)

Q. Now I wish you would relate what importance the Portland livestock market bears to this general northwestern community as a livestock market. Is there any other livestock market comparable with it north of San Francisco?

A. No, sir; there is not. We have other livestock markets in the northwest where there are meat packers. We have no other livestock market really in the northwest other than Portland; we have packers in Tacoma, Seattle, and Spokane. They buy considerable in the market and they have buyers in the interior who buy direct.

Q. What I am trying to develop is whether this is a livestock clearing house market comparable, expect in volume, to Kansas City and Omaha and Chicago and Denver, in a smaller way?

A. It is. A great deal of the livestock originating in the northwest territory flows through this market to the Puget Sound markets. In fact, a producer, or a commission man, can bring his stock here, and if the Portland market is not satisfactory he can sell it to a buyer from Tacoma or Seattle and divert it at the balance of the through rate. We have the (2874) diverting in transit privilege at the balance of through rate applying through Portland to Puget Sound. I can't say positively whether there is an extra charge for the diversion privilege on livestock, since I haven't looked at the tariff recently to see, but I am pretty sure there is not.

1547 I have a statement showing the carloads of livestock interchanged between the O.-W. R. & N. and the Southern Pacific Company at Portland for the years 1926 and 1927. The interchange takes place on the east side.

(The statement so offered and received was thereupon marked "Defendants' Exhibit No. 57, Witness Lounsbury.")

Commenting on this Exhibit No. 57, I have prepared (2875) a statement showing number of carloads of livestock interchanged between the Oregon-Washington Railroad & Navigation Company and the Southern Pacific at east Portland for the years 1926 and 1927. That shown under heading "Switch" on the Received column is the number of cars switched from the Southern Pacific interchange to the north Portland yards and those on the delivered statement are the number of cars switched from the north Portland yards to the Southern Pacific interchange.

On Exhibit 57, the initials "T. C." under Marengo stand for Transcontinental. U. P. stands for Union Pacific Railroad Company.

With regard to the gateways: the transcontinental gateway at Marengo is the Milwaukee. (2876.) Plummer is the Milwaukee. Marengo is in northeastern Washington; Plummer is in northern Idaho and Wallula is the point of interchange with the Northern Pacific.

"O. S. L." is the Oregon Short Line Railroad Company.

Q. Do you know of the livestock delivered to the Southern Pacific, whether any of that is destined to the packing houses at Salem, or any of the other valley or western Oregon points?

A. Some of it may be. There is a packing house at Salem. I think there is a small one at Albany.

The livestock delivered to the S. P. goes to any point on the Southern Pacific south of Portland, California, and Oregon.

1548 The Portland livestock market is served by the O.-W. R. & N. and there are joint tracks of the Portland, Spokane & Seattle and O.-W. R. & N. serving the Portland yards. (2877.)

Comr. McManamy. What I was trying to develop is, is it reasonable to assume that the livestock delivered to the O.-W. R. & N. by the S. P. is consigned to the Portland stockyards?

A. That that is marked "Switch," yes.

Q. (By Mr. Spencer.) Well, are there any other yards it is delivered to in Portland except the north Portland yards?

A. No, sir; and there is no other railroad to deliver it off of the Southern Pacific other than the O.-W. R. & N.

Mr. Spencer. That is what the commissioner wanted to know, I think.

Comr. McManamy. But the stock delivered to the Southern Pacific by the O.-W. R. & N. is going to some point other than Portland?

A. Yes.

It is not going to the point of the Portland stockyards?

A. No; anything that we deliver is coming from the yards, or coming from some point on the line.

Comr. McManamy. And going to the S. P. & S. for movement to some point on their line?

A. Yes, sir.

"Switch" means local movement, and under the head "switch" delivered to the Southern Pacific would be livestock switched from (2878) the Portland yards to the Southern Pacific interchange at east Portland by the O.-W. R. & N.

Exam. ROGERS. That originates at the Portland stockyards?

A. Yes, sir.

1549 Exam. ROGERS. Now "local" what is that?

A. That would be originating on the O.-W. R. & N.

Exam. ROGERS. That would be between Huntington and Portland?

A. Yes; the O.-W. R. & N. Lines, or it may be in Washington.

Exam. ROGERS. Yes; but it would not be on the Oregon Short Line?

A. No, sir; the Oregon Short Line is shown separately.

Q. (By Mr. SPENCER.) I am wondering whether that is clear or not, Mr. Lounsbury. Do any of these local cars here go through the north Portland yards?

A. Well, yes; they might go through the north Portland yards for feed and rest, yes; but they would be moving through the north Portland yards on through billing and they would be shown as local traffic.

Q. Where the switch is involved there has been a destination and delivery at the Portland yards, hasn't there?

A. Yes, sir; it originates there and we just simply perform a switching service in handling the cars from the yards to the Southern Pacific, if it is delivered to the Southern Pacific. (2879.)

1550 The Southern Pacific does not serve the Portland stockyards. The Southern Pacific can reach the north Portland stockyards only through the O.-W. R. & N. By my statement I mean that the Southern Pacific does not have access with their own rails to this clearing house, this cattle business over there at North Portland. They must interchange that traffic through us. The Southern Pacific rails terminate in the yards of the Northern Pacific Terminal Company at Portland. That is owned and operated by all the lines, that is by the Northern Pacific and the Southern Pacific and the O.-W. R. & N. The Southern Pacific have their industry tracks on the east side of the river. And the roads switch for each other on the east side of the river.

Q. And I asked you whether or not the Southern Pacific had access to the north Portland yards. I didn't mean by their own tracks.

A. Yes, sir.

Q. But whether the business gets in and out of there? (2880.)

A. Oh, yes; they do. I might state that the Southern Pacific break-up yards are at Brooklyn, which is practically South Portland.

Q. In the city limits?

A. In the city limits; and that is where this livestock is usually interchanged, brought down from Brooklyn to the east Portland

interchange with the O.-W. R. & N. and handled by the O.-W. R. & N. over its tracks to north Portland.

Mr. SPENCER. I wonder if the north Portland yards are shown on the exhibit introduced yesterday by the port commission. It perhaps might be of interest in the case.

Q. Well, could you indicate on this map, Exhibit——

Exam. ROGERS. I think that is Exhibit 48, if I am not mistaken.

1551 Q. (By Mr. SPENCER.) Well, the map of waterways and railroads, published by the commission of public docks, where the location is of the Portland stockyards; I mean with respect to railroads, the Columbia River, and so on.

A. The stockyards would be located between Portland and Vancouver, as shown on this map, at the junction of the red and the green lines.

Q. It is on the Oregon side? (2881.)

The stockyards are adjacent to the Columbia River and between the railroad bridge and the highway.

Exam. ROGERS. Referring to the lower part of the exhibit, do the Southern Pacific switch engines go over to the yards and get the cars you have shown under "switch"?

A. No, sir; they do not. The Southern Pacific, as I stated, has its break-up yards in Brooklyn. The O.-W. R. & N.'s break-up yards are in Albina on the east side. They deliver traffic to the interchange track at the east end of the steel bridge. The Southern Pacific brings stock to the east Portland interchange; we take it with our engine over to the stockyards; and vice versa, we would bring it with our engine from the stockyards to the point of interchange and they would have an engine there to take it.

The Southern Pacific doesn't go into the north Portland yards. They might at times run as far as our yards at Albina, but they would not go beyond that. Now, I might say that there are several switching districts in Portland known as Portland, which are the west side, east Portland (2882), south Portland, Albina, Kenton, and Linnton, the latter being served by the Northern lines, and all railroads entering Portland practically have access to this entire switching district.

1552 Mr. SPENCER. That is, to the north Portland yards?

A. Yes, sir; well, the Northern lines, through the S. P. & S., serve the stockyards direct.

Q. Well, what is the operation over there? Is there a rotation, under which one road operates for one period and another the other?

A. Yes, sir; as between the S. P. & S. and the O.-W. R. & N. The yards are served by a joint track, and for a period of three or six months the O.-W. R. & N. will perform the switching, and for a period of three or six months the S. P. & S. will perform the service on the joint tracks that serve the yards. It is an intraplant operation. The packing houses are in the yards in that same territory; also the slaughter houses.

The Southern Pacific does not do switching at any (2883) time. They do not reach the yards. But their traffic moves in and out of there just as freely as our does.

Exam. ROGERS. What I was interested in is, whether it may not properly be said that the O. W. was giving the S. P. this traffic, or whether it was just simply performing a switching service for the Southern Pacific in getting it out of the Portland stockyards.

The WITNESS. That is traffic in which the O.-W. R. & N. has no interest other than as a switching carrier. By that I mean where the traffic is under the heading "switch."

Q. (By Mr. SPENCER.) But the other originates on the O.-W. R. & N.?

A. That marked "local" originates on the O.-W. R. & N.

Mr. SPENCER. It is cleared up now, I believe.

The Malheur County producing territory is tributary to Portland, Tacoma, and Seattle markets, and it is only in exceptional cases
1553 where the California packer can (2884) pay sufficiently more to justify the difference in freight rates that will attract any appreciable movement to California markets. The present route from Malheur County points to Los Angeles is shorter via the Union Pacific through Salt Lake City than via the proposed cross-State line and Southern Pacific.

In 1926 there was no movement of butter in carloads from points on the Brogan and Oregon Eastern branches.

The rate on butter, eggs, and dressed poultry of $1.64 per 100 pounds from Payette and Nampa, Idaho, to San Francisco, is the same via Portland as in effect via Wells and Ogden in straight or mixed carloads, and in connection therewith storage, grading, or repacking in transit is permitted on the Oregon Short Line and is also permitted at Portland and Pendleton, Oregon, on the Oregon-Washington Railroad & Navigation Company.

These are commodity rates and in my opinion nothing less would be applied for movement via the cross-State line. The refrigeration charges are likewise the same, namely, $55.00 per car.

Exam. ROGERS. Your refrigeration charges are not (2885) blanketed like your transportation rate, are they?

A. For through refrigeration, yes.

Exam. ROGERS. Are they based on cost of service?

A. They are published in the protective tariff used by all lines and show the charges between different districts locally in one State and from one State to another State, and also the charges where the shipper performs the initial icing and buys the ice. (2886.)

Exam. ROGERS. What I am getting at, under the basis of charges under the perishable protective tariff is it your thought that a distance of three or four hundred miles wouldn't make any difference in the charges?

1554 A. No, sir; and I might illustrate that. We have the short line from here to Wallace, Idaho. By "we," I mean the Oregon-Washington Railroad & Navigation Company. The North-

ern Pacific meet those rates by their long line through Paradise, Mont., under relief from the commission. The long line meets the short line rates. The charge is just the same both ways.

Exam. ROGERS. I was under the impression that the basis for the perishable protective tariff was purely and simply the cost of service.

A. You can ship a car of perishable freight from here to Granger, Wyoming, via Roseville or direct, at the same perishable charge.

Wheat: Mr. Teutsch estimates 9,410 tons available for westbound movement via cross-State line from Malheur County. In 1926 the total movement from off Brogan and Oregon eastern branches westbound was 2,464 tons, which moved entirely to Oregon destinations, and by Oregon destinations there I mean westbound through the Huntington gateway to Portland (2887) at the final destination.

The movement of wheat from southern Idaho to the coast depends very largely upon the crop production in the Northwest. In the event of a large wheat crop in the Northwest the movement from southern Idaho is small, but when there is a light crop in the Northwest the movement from southern Idaho shows a substantial increase, particularly of soft wheat, which is required for mixing purposes by the mills and for export.

The difference in distance to Portland in favor of the Huntington route will continue to hold the movement to the main line.

1555 Furthermore attention is called to the fact that under the Oregon Short Line tariffs the rates to the coast are higher on flour and mill feed than on the wheat. It is not likely that any mill feed will move from southern Idaho to western Oregon.

In compliance with an order of the Public Service Commission of Oregon, tariff effective March 1, 1927, the railroads in this State are required to carry intrastate distance rates on grain and articles taking grain rates, potatoes, onions, hay, and straw, applicable for single line haul and for joint line haul, the rates for single line haul being slightly less than for joint line haul.

I have prepared a memorandum showing wheat rates from (2888) representative producing and shipping points The Dalles and east in Oregon and Salem and Eugene as compared with present rates from Ontario, Vale, Brogan, Riverside, Crane, and Burns to Portland, via Huntington and via Crescent Lake.

(Said statement was thereupon received in evidence, marked "Defendants' Exhibit No. 58, Witness Lounsbury.")

The figures via Crescent Lake, No. 1, being the intrastate rate for joint line haul, and the figures in the last column being combination on Crescent Lake. The rate via Huntington to Portland is a one-line haul.

Comr. MCMANAMY. Well, is that considered a one-line haul with the Burns branch operated by the Oregon Short Line Railroad? Burns to Portland?

A. Well, at the present time the intrastate rate is not effective from Burns to Portland, because that is an interstate haul. It

would be, strictly speaking, a two-line haul. And from Burns to Ogden would be a one-line haul, under the present system of operation.

1556 Exam. ROGERS. Well, this rate from Burns to Portland as via Huntington, is that a joint rate?

A. No, it is a through rate; a through rate, the same as the rate from Ontario would be a through rate, except that the (2890) rate from Burns is higher and made by an arbitrary over Crane.

Exam. ROGERS. Well, it is a joint rate, then, between the Oregon Short Line and the Oregon-Washington Railroad & Navigation Company?

Exam. ROGERS. But by Crescent it is a combination of locals?

A. Well, I have shown both the Oregon State intrastate scale for a joint line haul, as well as the combination on Crescent Lake, and when I prepared this statement there was some question in my mind whether or not the continuous intrastate distance rate would apply. I had in mind the fact that since the Great Northern has extended their line from Bend to Klamath Falls there is no joint haul application of those rates between the Great Northern and the Southern Pacific.

Mr. SPENCER. What I think the examiner wants to develop is purely what this Oregon tariff, provided it is continued for movement over two or more lines—what particular feature you had in mind in referring to it. Does it provide for the through movement of all of these commodities and allow the roads involved a small arbitrary if there are more than two roads involved?

A. Yes, just an arbitrary of ——. (2891.)

Q. Well, they are all, in effect, joint rates, are they not?

A. Yes, sir.

Q. Pursuant to order of the State commission?

A. Yes, sir; but another purpose in showing this statement which I think I am going to refer to here is the fact that the

1557 wheat rates are so much lower from the Columbia River wheat producing section, The Dalles and east, to Salem and Eugene than any possible rates that would apply on any basis from eastern Oregon and from the Burns district to southern Idaho.

There is no tariff establishing a rate from Burns via Crescent. We constructed that rate on the combination of locals at Crescent Lake.

Comr. MCMANAMY. How would you establish the rate from Burns to Crescent, on what basis?

A. On the basis of the one-line haul.

Comr. MCMANAMY. Mileage?

A. Yes.

Comr. MCMANAMY. Distant basis?

A. Yes. I might add that that shows the difference between what one line earns under this tariff for a single-line haul and what they have to divide when they (2892) carry the continuous mileage for a joint line haul, under this Oregon tariff.

Referring to Exhibit 58, the figures in the rate column are in cents per one hundred pounds.

The United States Department of Agriculture shows the wheat production in western Oregon for the year 1927, 4,403,900 bushels; for eastern Oregon 22,377,325 bushels.

There are a number of flour mills located at points in western Oregon, whose principal supply of wheat is obtained locally. They do buy and ship some hard wheat from eastern Oregon which is used for mixing and blending purposes.

During the year 1927 the O.-W. R. & N. delivered to the Southern Pacific at east Portland, wheat 43 carloads, barley 37 cars, and oats 1 car.

It is manifest that the millfeed used in the dairy industry in the Willamette Valley is now being purchased locally, there-
1558 fore it is not practicable to assume that there will be any wheat shipped from Malheur County via the proposed cross-State line to western Oregon. (2893.)

Apples: Mr. Teutsch estimates 138 cars, or 2,346 tons. During 1926 from off the Brogan and Oregon eastern branches there were 62 tons to southern California. This tonnage would not move via cross-State line.

There would in all probability be no movement from Malheur County to San Francisco in competition with apples from Rogue River, Hood River, Yakima and Wenatchee Valleys moving to the coast thence via water at much cheaper rates. As a matter of fact the California markets can not begin to consume the apples produced in that State, amounting to over six million bushels.

Potatoes: Mr. Teutsch estimates 174 cars, or 3,132 tons. There was no movement from Brogan and Oregon eastern branch points to California in 1926.

In order to show the relative rate adjustment on potatoes to San Francisco and Los Angeles, I have prepared a statement showing rates from Boise, Payette, Idaho, and Ontario, Oregon, as compared with rates from Yakima Valley, Redmond, Oregon, on the Des Chutes branch, from Woodburn and Eugene in western Oregon and from Klamath Falls and Crescent Lake, and from Portland.

(Said statement was thereupon received in evidence, marked "Defendants' Exhibit No. 59, Witness Lounsbury."

A. By rail and water I mean to Portland, and by the regular established steamer lines to San Francisco.

Exam. ROGERS. When you refer to the California apples, do you have in mind that because California didn't consume her own apples that there wouldn't be any movement of apples into California?

1559 A. No, sir; I just mentioned that as one factor in connection with the fact that the California market was pretty well supplied from Rogue River, from Hood River, and Yakima and Wenatchee Valleys, which have much lower rates and just as good

apples, and I might say, too, that the apple rates compared relatively with the rates on potatoes, but I will get to the apple rates later.

Exam. ROGERS. All right. But, as a general proposition, Mr. Lounsbury, is it true that when a local territory produces enough of any commodity or any article to supply that territory, that that has any significance as to whether there will be a movement of the same article or commodity from other territories into that territory?

A. Well, I don't think any of the Montana or Dakota mines ship coal into Utah. (2895.)

I believe Yakima and Hood River ship apples to the Shenandoah Valley and Washington, D. C.

Exam. ROGERS. That is just the thought in my mind. Take the Shenandoah Valley, there are enough apples produced in that valley——

A. They pack apples in barrels and they ship them out, and after a certain period they are gone, and I don't understand that in the Shenandoah Valley they store them the year around like they do out here; store these boxed apples in cold storage.

Comr. MCMANAMY. That once was true, but no more.

A. Now, take the New York market; New York is the second largest producing State of apples in the United States, but there are more Washington apples sold in New York than there are of New York.

1560 Exam. ROGERS. Take down where I come from, they manufacture a lot of furniture, but that furniture is shipped out of the State, and furniture from out of the State shipped into the State, and I was wondering if that was your impression of the general situation?

A. Well, I don't think the furniture would be comparable to fruit, Mr. Examiner; we have furniture factories here, and the (2896) great bulk of their product is shipped out.

With respect to potatoes, which I am now discussing, we have had prices so low on potatoes that in these very rich valleys right around Portland the growers wouldn't dig them, because they couldn't get enough to pay the cost of even digging and packing them and putting them into market.

There is no movement westbound, transcontinental, of New York apples to the Pacific coast. There are no shipments of apples into the distinctively apple-producing districts, like Hood River Valley or Yakima Valley or Wenatchee or Rogue River; they sell their own product locally.

Exam. ROGERS. I thought you were making the point that because California produces more apples than they consume that there wouldn't be any movement of apples into California.

A. No; I just used that as a factor. What I had in mind was that the production of apples produced in California, a certain portion of those apples will be consumed in California by the California market, and they would naturally use those apples which

could be obtained at (2897) much cheaper freight rates, consume those, before they went somewhere else to get them, unless they could get them cheaper from some other district.

I think Exhibit No. 59, rates on potatoes, speaks for itself.

1561 The rate from Yakima on potatoes to San Francisco is 36½ cents and 60½ cents to Los Angeles. These rates via Crescent Lake are a combination of the locals. The others, meaning from such points as Yakima and all of the points of origin mentioned there, via different gateways, are through rates, except, of course, the rates shown from points south of Portland on the Southern Pacific would be one-line haul rates, and the rate from Portland via the steamer line is a local rate. I have shown here the steamer line rate from Portland to San Francisco, in the last column, which is 25½ cents, and from Portland to Los Angeles, which was 40½ cents.

Exam. ROGERS. But you take your rate from Boise, the distance (2898) by Crescent is less than via Portland or via Wells to San Francisco?

A. Yes.

Q. Now, is there any more reason for expecting that the combination of locals would be applicable via the Crescent Lake route than via the Portland or Wells route?

A. Well, in the course of time the rate via the Crescent Lake route would probably be equalized, but that doesn't mean there would be any particular movement via that route.

Exam. ROGERS. No, but how do you account for the difference between the eighty-five per cent rate on the Portland gateway and the sixty-two per cent rate on the Wells gateway?

A. Simply because the movement and the service, I think, has in the past taken the business that way. I don't believe there is any significance to the difference in distance.

1562 I have not shown the rates to Los Angeles under heading via Crescent Lake as such rates would be made by adding locals over (2899) San Francisco. That is the usual basis. Mr. Teutsch shows, Exhibit 1, page 5, Harney County.

Estimate of present agricultural tonnage available for movement over proposed cross-State railway westbound as follows:

Sheep	870 tons,	93 cars.
Cattle	5,902	473
Hogs	269	27
Wheat	1,530	37
Horses	230	20 cars; or
Total available of	8,801 tons,	650 cars.

The actual movement of these commodities from Crane and Burns and intermediate points to all destinations for the year 1926 was as follows: (Crane and Burns are the only shipping points in Harney.)

Sheep, 2,391 tons, 213 cars; cattle, 5,081 tons, 392 cars; hogs, 3 tons, 1 car; wheat, 281 tons, 8 cars; horses, 512 tons, 37 cars.

The principal market for sheep is in the East, although he estimates 25 per cent moving to California over the (2900) proposed cross-State line.

In reply to inquiry from Mr. Spencer, Mr. Teutsch stated that the livestock from the Canyon City district north of Burns was being driven to Seneca and shipped over the line between Seneca and Burns, and that there was no movement to speak of via the Sumpter Valley Railway operating from Prairie City to Baker, Oregon. I have obtained from the general freight agent of the Sumpter Valley Railway statement of movement for 1926 and 1927 from Prairie City and other points on his line to Baker as follows:

1563 1926: From Prairie, cattle 200 cars, sheep 82 cars, horses 2 cars; from Austin, cattle 19 cars, sheep 25 cars; from Tipton, sheep 20 cars; from Whitney, sheep 5 cars; total, cattle 219 cars, sheep 50 cars, horses 3 cars.

1927: From Prairie, cattle 154 cars, sheep 32 cars; from Austin, cattle 18 cars, sheep 26 cars, horses 1 car; from Tipton, sheep 15 cars; from Whitney, cattle 1 car, sheep 35 cars; total, cattle 173 cars, sheep 108 cars, horses 1 car.

The Sumpter Valley Railway is a narrow-gauge line. (2901.) I haven't the figures showing how many cars for one standard gauge car. I wouldn't like to make a guess of it. I would rather leave it to you. There would be a difference between a narrow and standard gauge. How substantial I wouldn't say.

Taking up Exhibit 26, Hal. F. Wiggins, pages 1 to 36, headed "All commodities—Transcontinental—By commodity groups," showing total carloads and total tons of all commodities moving between points on Southern Pacific Company's lines in Oregon and the various States and countries listed via Portland, via Ogden and other junction gateways for six months of 1926 and multiplied by two to arrive at the total for the year 1926. (2902.)

Page 36 gives the total percentages of the commodity groups from which it is shown that agricultural products comprise 8.28 per cent and lumber and forest products 82.26 per cent, these two commodity groups comprising over 90 per cent of the total movement.

In his exhibit 28, pages 1 to 3, showing estimated tonnages and revenues created by proposed cross-State line in Oregon

1564 for the first year, under heading "Eastbound traffic," Mr. Wiggins has taken the agricultural products listed in Mr. Teutsch's Exhibit 1 for the western Oregon counties, Lane, Douglas, Linn, Benton, Lincoln, Coos, Curry, Josephine, and Jackson, namely, apples, pears, prunes, walnuts, canned goods, eggs, broccoli, cherries, berries, bulbs, dried fruit, dressed poultry, and seeds.

We do not have any record of origin by counties of the above commodities moving from Southern Pacific-Oregon lines to transcontinental territory via Portland and O.-W. R. R. & N., but a check of our east Portland interchange of carload commodities above listed received from the Southern Pacific-Oregon lines from all counties

served by the Southern Pacific south of Portland for the years 1926 and 1927 are shown on the statement submitted as next exhibit, Exhibit 60. (2903.)

(Said statement was thereupon received in evidence marked "Defendants' Exhibit No. 60, Witness Lounsbury.")

The 1926 statement shows a total of 1,246 cars of the commodities named received from Southern Pacific, of which 271 were in switch movement principally to docks for forwarding by water, 90 local, 831 to destinations on the Oregon Short Line, Union Pacific and east thereof, and 54 moving through short-haul gateways, that is, via Marengo and Plummer thence Milwaukee, or through Spokane either in connection with the Great Northern or the S. I., C. P., and Soo line.

The 1927 receipts of the commodities listed show a total of 1,056 cars, of which 356 were switch movement to docks for loading to ships, and so forth.

I might here state that there might be a few of those cars go
1565 to wholesale houses at Portland, but they would be very small in comparison with the total switch movement, as most of that is switched from the interchange to the docks, and by docks, I mean the docks not served by the Southern Pacific lines but where we perform the switch.

Explaining the various headings, "Switch" means that the Oregon-Washington Railroad & Navigation Company (2904) merely performs a local switch from the Southern Pacific interchange at Portland in connection with those cars. By performing the interchange, I mean, the Southern Pacific from which we take the traffic, delivers it to the docks that are served by the Oregon-Washington Railroad & Navigation Company, or to some industry that may be served by the Oregon-Washington Railroad & Navigation Company, but as previously explained, that would be very small.

Q. Well, where is the real terminal where the bulk of this stuff goes?

A. St. Johns. It is the Municipal Terminal No. 4 at St. Johns, which is served by the Oregon-Washington Railroad & Navigation Company tracks. We do the switching there for all lines.

Comr. McManamy. What does this "East of Missouri River" indicate? (2905.)

A. All destinations east of Missouri River.

Comr. McManamy. Via any line?

A. That is delivered to any line by the Union Pacific at Council Bluffs.

Comr. McManamy. And these shipments come from points on the Southern Pacific lines in Oregon?

A. Yes, sir; through the Portland gateway.

Comr. McManamy. Then I notice under the heading "Prunes" there are 48 cars in 1926 shipped to points east of the Missouri River?

1566 Yes, sir; those prunes came from Southern Pacific lines in Oregon. In 1927 there were 76 cars of dried prunes shipped to points east of the Missouri River. I might state that our interchange does not show dried or green, but I doubt if we have had any considerable amount of (2906) green prunes. I don't recall any particular movement.

Comr. McMANAMY. You have 293 cars of broccoli. Forty-three cars of cherries.

A. Yes. Those all move by express, and would continue to move by express by through limited trains, to points east of the Missouri River.

Comr. McMANAMY. And in 1927, 69 cars of cherries.

A. Yes, sir; all by express. They all move by express, and they would naturally come in here to take the Chicago Limited train.

Exam. ROGERS. Well, why don't the Southern Pacific take them down the other way?

A. Because of the quicker movement. These shipments of cherries by express, time is a very important factor in connection with those, naturally. They can't even ship them in refrigerator cars. Now, we have a heavy cherry movement from The Dalles and Hood River east. They all move by express, too, just the same.

Exam. ROGERS. I was thinking about all that movement on your exhibit. (2907.) They all seem to be from Southern Pacific originating territory, delivered to the Oregon-Washington Railroad & Navigation Company at east Portland. Of course, the switch and local movement, that must come this way.

A. Yes, sir.

Exam. ROGERS. But to the points east of the Missouri River why wouldn't the Southern Pacific take that over their line?

A. Over the cross-State line?

1567 Exam. ROGERS. No, down through Roseville or the Alturas route. Is it because the shipper routed it this way?

A. Yes, I think so, either because the shipper or consignee routed it via the Portland gateway. I think the Southern Pacific would have been glad to take it via Ogden. (2908.)

(Continuing.) O.-W. heading means local and points on the Oregon Railroad & Navigation Company; O. S. L. local means points on the Oregon Short Line; U. P. local means to points on the Union Pacific Railroad; east of Missouri River is all destinations east of Council Bluffs; west of Missouri River is destinations to points where the car was delivered at a junction point west of Council Bluffs and was not carried through Council Bluffs; Marengo Transcontinental means delivered to the Milwaukee at Marengo, Washington; Marengo other than transcontinental means local points on the Milwaukee; Spokane transcontinental has reference to delivery principally to the Spokane International, C. P. and Soo Line; Spokane other than transcontinental might be delivered to any lines beyond Spokane local; Plummer other than transcontinental would be Milwaukee local.

Q. Now, right in that connection, you say this Exhibit 60 reflects the business in these different specified commodities received by the O.-W. R. & N. Company at Portland from all points in western Oregon on the Southern Pacific lines?

A. Yes, sir.

Q. Now, are those commodities produced in greater volume from the counties that were not included in the list you mentioned by Mr. Wiggins, or in Mr. Wiggins' testimony, than in the counties he did include?

A. Absolutely, yes. The great bulk of the production of the (2909) prunes, canned goods, and the cherries is in the counties north of Linn County.

1568 Q. Well, the pears and broccoli would be produced south of Eugene, I assume?

A. Yes, sir; I intend to deal with these individually later.

Exam. ROGERS. You may be coming to it; if you are we won't bother with it now; but can you tell us about the origin of these various commodities?

A. Well, I can tell you principally. As I stated at the outset, the interchange report does not show the point of origin. I took these figures off the interchange report, but I have a pretty general knowledge of western Oregon, and I think, after I get through, I can answer most any question.

The 1927 receipts of the commodities listed show a total of 1,056 cars, of which 356 were switch movement to docks for loading to ships, etc., 166 local, 481 to Oregon Short Line, Union Pacific and east thereof, and 53 cars moving through Marengo, Plummer, and Spokane gateways via Northern lines.

Attention is called to the fact that of the apple movement from western Oregon through the Portland gateway in connection with the Oregon-Washington Railroad & Navigation Company for the year 1927 out of total of 90 cars, 46 were (2910) switched at Portland terminals, 32 moved locally, 1 to destination on the Oregon Short Line, 4 to destinations on the Union Pacific, and 7 to east of Missouri River.

There was no movement of pears through the Portland gateway, either in 1926 or 1927. This commodity may have been shown under heading "Fruit N. O. S."—and also green prunes may have been shown on the interchange under that heading—of which a total of 18 cars moved to destinations through Huntington in 1926 and

1569 15 cars in 1927. That is all of the fruit that moved under the heading "Fruit N. O. S."

Prune receipts: Our interchange does not make any distinction between green and dried prunes, but the movement of prunes from from Oregon points generally consists of dried products. Of the prune receipts through the Portland gateway totaling 217 cars for 1927, 100 were switched at Portland, 10 moved local on the O.-W. R. & N., and 95 moved east through the Huntington gateway.

In my mind the switch movement has bearing on whether or not they are dried on fresh prunes, if I did not otherwise know. The entire switch movement would be dried prunes.

That is both for export and for shipment to the Atlantic coast. (2911.)

Q. Well, you stated that this movement of prunes from Oregon points generally consisted of the dried product; is that true of the Milton and Freewater prunes?

A. Well, I am dealing with the western Oregon here.

Walnuts: Statement shows 10 cars, of which 4 moved to transcontinental destinations, 3 via the Union Pacific through Huntington.

Canned goods: Statement shows that heavy percentage moves to Portland to be switched to docks for movement by water. Out of a total of 387 cars but 64 moved to transcontinental destinations via the Union Pacific system.

Now with respect to these prunes and canned goods, I have obtained from the records from the port of Portland, which is contained in their annual report, the amount of dried prunes and canned goods exported for the years 1926 and 1927.

1570 Dried prunes, 1926, foreign 17,198 tons, domestic 10,359 tons; 1927, foreign 19,407 tons, domestic, 9,694 tons.

Canned goods, including fruit and vegetables: 1926, foreign 12,821 tons, domestic 36,712 tons; 1927, foreign 10,987 tons and domestic 40,564 tons.

With respect to these commodities moving via water through the port would state that they are being moved by truck as well as by rail and electric line from as far south as Roseburg on the Southern Pacific and The Dalles on our line (2912) east of Portland. That includes canned goods as well as prunes.

There were no eggs routed through Portland and the Oregon-Washington Railroad & Navigation Company. The packing houses where the eggs are assembled and packed are located on the Oregon Electric at Eugene and Albany, the county seats of Land and Linn counties, with the result that this movement is via the Oregon Electric and the Northern lines.

It will be noted that the movements of broccoli for 1927 shows a very heavy decrease as compared with the year 1926.

Receipts from the Southern Pacific at Portland for the year 1928 were 163 cars, of which 152 moved east via Huntington, showing further decreases in 1928 under 1927.

Comr. McMANAMY. How does it compare for a period of two years? What do you think that indicates?

A. What, in connection with the broccoli?

Comr. McMANAMY. Yes. You are directing especial attention to it; what do you think it indicates generally?

A. I think it indicates a very uncertain condition in order to estimate a movement of the average or annual production to go across the cross-State line. I don't think that you can

1571 estimate what next year's broccoli crop will be, by any means, other than to know what acreage has been planted and then guess on the weather, the same as the grower has to do.

Exam. ROGERS. When does the broccoli movement ordinarily take place?

A. In the spring of the year. It starts usually late in February, early in March. The movement is usually very rapid. It is usually over in about 30 days or six weeks; it may take a little longer, perhaps two months. I was down there this season during the shipping season and I talked with some of those growers, who are very much dissatisfied with the results that they were obtaining this year and I know that those growers are dissatisfied with the broccoli business as a result of returns. The man with whom I conversed was a member of the association and had a wonderful crop.

1572 Exam. ROGERS. The point I was making about the broccoli, Mr. Lounsbury, was that your figures for 1928 covered the entire movement for 1928?

A. Yes, sir; the movement is over now, and the receipts report, as I stated, moved east via our line, shows 163 cars, of which (2915) we had 152 as compared with the two previous years.

Now as I stated, the figures in the exhibit include all of the receipts at east Portland from all of the counties served by the Southern Pacific in western Oregon, and with respect to prunes, walnuts, canned goods, and cherries, the heaviest production is in the counties north of Linn County.

On page 36 of Mr. Wiggins' exhibit the total eastbound movement of agricultural products through Portland for the year 1926 originating on the Southern Pacific-Oregon lines destined to transcontinental points was 982 cars, of which 824 cars of commodities listed in my exhibit moved to transcontinental points via the Huntington gateway. In 1927 the movement via Huntington was 569 cars. The Portland gateway is open to the other lines, and in Wiggins' statement undoubtedly there would be shipments that may have been routed via the Northern Pacific or Great Northern, or the S. P. & S. and the Northern lines out of Portland, as through rates apply by those lines as well as via the O.-W. R. & N. and the Union Pacific.

Under heading livestock, in Mr. Wiggins' exhibit, page 36 is shown a total of 7 cars eastbound and 4 cars westbound via the Portland gateway. I note on page 7 one car eastbound and one car car westbound to and from Illinois, and on page 33 one

1573 car westbound—one car eastbound and one car westbound to and from Idaho, which would indicate that this stock is (2916) moving to and coming from exhibitions.

An examination of our interchange records showing the number of carloads of livestock interchanged between the O.-W. R. & N. and the Southern Pacific Company at east Portland for the years 1926 and 1927 is covered by the exhibit already introduced, Exhibit 57. Referring to this interchange, there is some livestock received by the

Southern Pacific that originates in California and is cleared through the Portland market at north Portland. At certain seasons of the year, that is a frequent transaction. There is a movement from California, not only for north Portland but Tacoma and Seattle, that is cleared through north Portland, going to Tacoma and Seattle, where there are packing houses. The Carstens Packing Company at Tacoma and Frye & Company at Seattle.

Under list of westbound transcontinental traffic on page 56, moving via Portland, Mr. Wiggins shows under the agricultural group 436 cars, which undoubtedly consist of corn and other grains for feeding purposes.

Looking over the recapitulation, shown on pages 33 to (2917) 36, inclusive, it will be noted from Exhibit 26 that there were 206 cars of agricultural products from Nebraska, 51 from Iowa, 1 from Kansas, 8 from Minnesota, 23 from South Dakota, and 57 from Montana.

The O.-W. R. & N. delivered to the Southern Pacific at east Portland during the year 1927, 246 cars of corn for all points on the Southern Pacific lines in western Oregon, indicating that considerable movement of these agricultural products reach Willamette Valley via the Northern Pacific.

1574 Another item shown on page 36 of Mr. Wiggins' exhibit moving westbound via Portland under Group 3 is products of mines. He shows 222 cars for a six-months period. In the year 1926 coal from Utah and Wyoming amounted to 248 cars.

Q. So that 248 should be compared with 444 given by Mr. Wiggins; is that right?

A. Yes, sir; well, his 444 is everything. I am just showing that under that heading we handled 248 cars of coal.

Exam. ROGERS. Mr. Lounsbury, if I may interrupt you, did you find in Mr. Wiggins' exhibit what you would term inaccuracies or incorrect statements, or is what you are saying in explanation and to go with Mr. Wiggins' exhibit, just as a general observation?

A. Mr. Wiggins' exhibit shows the entire movement east and (2918) westbound from off the Southern Pacific-Oregon lines for the year 1926. The purpose of my statement is to show what the Portland gateway and O.-W. R. & N. handled during the year as compared with the actual showing of six months and an estimate of another six months. In other words, I am showing against his figures the O.-W. R. & N. actual movements through the Portland gateway of the commodities that he principally deals with.

Now, I am not in position to say whether there were any inaccuracies in that statement, because I don't know the originating point of this business on the Southern Pacific. I don't know the destination of all of it that might have moved, or what did move through the Portland gateway via other lines or other routes.

1575 Exam. ROGERS. I gather from that, then, that your major comparison would be the six months for which Mr. Wiggins made estimate?

A. No, sir; my comparison is by years. And he took six months' actual figures and multiplied those by two to get the year, I understand.

Exam. ROGERS. What I am getting at is, would his error be in the estimate for six months? Could he be in error?

A. Why, absolutely there could be an error. If he missed a seasonal movement of some particular commodity in his alternate (2919) months, then he might not get any of that commodity in his statement, or, on the other hand, if he caught a seasonal movement one month or two months it could not move during the balance of the six months, and if he multiplied that by two his figures would be wrong. As, for instance, broccoli. Broccoli would take the first six months, and if he multiplied that by two he would get an error.

Mr. ELLIS. It should be understood here that the six-months basis was used by Mr. Wiggins after a stipulation with the Southern Pacific to the effect that by multiplying it by two he would get an accurate showing of the year's traffic, that is a fairly accurate showing.

Mr. DEY. Fairly accurate. If a thing is accurate, it is accurate, of course. In order to save a tremendous expense—even the six months ran into a lot of money to get this up—we agreed to the introduction of this testimony, with the understanding that by alternating the months and then (2920) multiplying by two we would reach a fairly representative or fairly accurate statement.

1576 Mr. SPENCER. A very important consideration, as I gather is that Mr. Lounsbury's analysis shows that of this business a substantial part moves in connection with other transcontinental lines and there is every reason to assume that they would continue to participate in that business. That is the purpose.

The WITNESS. Another purpose is to show the distribution of the traffic which we received from off of the Southern Pacific-Oregon lines from the valley, having in mind, as I proceed in this illustration, that our friend, Mr. Teutsch, has taken it all and given it to us over the cross-State line, and I will get to that later.

With respect to lumber and forest products moving eastbound to transcontinental destinations, as listed on page 50 of Mr. Wiggins' exhibit, it will be noted that 1,044 cars moved via the Portland gateway, which should be doubled, making a total of 2,088 cars originated in territory Marion County and north equidistant via Portland or proposed cross-State routes. This would make 38 per cent of the total via Portland, as shown in the first column of the statement.

Now on page 51 of this exhibit Mr. Wiggins shows the distribution of forest products to transcontinental destinations by States. It should be noted that in this statement he has shown the States of Idaho, Montana, and Utah, which are not transcontinental destinations. I have, therefore, included these States in my next exhibit. (2922.)

(The statement was thereupon received in evidence marked "Defendants' Exhibit No. 61, Witness Lounsbury."

1577 The WITNESS. Showing the distribution of lumber by States of destination originating at all points on the Southern Pacific-Oregon lines moving via Portland, O.-W. R. & N. and connections for the year 1926, which shows via the Huntington gateway a total of 2,395 cars, via Marengo and C., M., St. P. & P. 694 cars, via Spokane, S. I., C. P. and connections 289 cars, and via Spokane and Great Northern 13 cars. Were we to deduct 35 per cent to cover that portion originating at mills in Marion County and north above referred to it would leave 1,572 cars, which might represent that portion originating south of Marion County.

In his cross-examination Mr. Spencer referred to the figure of 719 cars shown on page 51 of Mr. Wiggins' exhibit for the six months' period destined to Minnesota. It will be noted that my exhibit shows 28 cars via Huntington, 300 via O.-W. R. & N., Marengo and the Milwaukee, 155 via O.-W. R. & N., Spokane for the entire year showing that the balance moving through Portland as shown in Mr. Wiggins' exhibit was routed via other northern lines.

With respect to movement to Montana Mr. Wiggins shows (2923) for six months' period 54 cars as against actual movement via O.-W. R. & N.—Huntington 8 cars, and via O.-W. R. & N., Marengo and Milwaukee 18 cars for the entire year, indicating that the balance moved via northern routes.

In his exhibit, pages 53 to 67, which is not summarized, Mr. Wiggins undertakes to show in some detail statement with respect to movement of forest products listed as logs, posts, poles, and cordwood, ties, lumber, timber, box shooks, etc. All of these commodities are included in the exhibit presented by me under the heading of lumber and forest products.

1578 At this point I desire to state that the routing of lumber from mills located not only in western Oregon but in the Northwest generally is influenced to a large extent by considerations tending to favor the originating line, such as the mill and shipping sheds being served by industry tracks and thereby dependent upon the agent and train crews for satisfactory service in the matter of daily spotting cars for loading:

First: The railroad agent and employes constantly cooperating with the mill operators to take care of their loading requirements. In this connection, I might add at this point that the agent of the railroad, the originating railroad, is a very important factor in the conduct of the mill's shipping business. He, in connection with the mill superintendent or the shipping clerk (2924) anticipates the movement, is in close touch with the orders for cars and keeping the dispatcher advised of the requirements so that the cars can be there for loading and spotted on the tracks for prompt loading, and all of that cooperation, together with the responsibility placed on the

agent for securing the long haul, is a very important contributing factor to the originating lines receiving the long haul.

Second: Transportation of logs and low rates from the timber to the mills, requiring daily and satisfactory service to keep the mills supplied with logs to meet its requirements based upon the general understanding that the manufactured product will move out over the originating line.

Third: And, not of small importance, the dependence of the mill operator or shipping clerk upon the local agent for rates to all destinations so that through the medium of car orders and rate
1579 quotations the agent at the shipping point is familiar with the mill's operations and by reason of the responsibility placed upon him to secure the maximum percentage of tonnage he exerts what influence he can to secure the business. He knows of all orders which the mill has, in connection with which the consignee or brokers request adverse routing. He can immediately put the solicitation machinery to work by telegraphing to the general agent at the eastern point of destination to see the consignee and secure the business, and promptly does. (2925.)

Exam. ROGERS. All of these things you are talking about are what competition does, aren't they?

A. Yes, sir; but it also shows that the originating line serving the industry, whether it is a sawmill or a cannery, or anything else, has a decided advantage. I might add in that connection that we have through rates on apples in connection with the Great Northern from Wenatchee through Spokane and the Union Pacific to points on the Union Pacific as far as Omaha and Kansas City, but we don't get the business.

Exam ROGERS. Didn't you say a while ago in commenting on some of Mr. Wiggins' exhibits, that some of the traffic must have gone the other way because rates were in effect that way?

A. I don't recall any such statement, because the rates on lumber are the same via all routes.

And to further illustrate this point, I recall when I was traveling freight agent of the Southern Pacific on the Oregon lines two prominent men who were putting in a new mill of one hundred thousand feet daily capacity, and I heard that the machinery for that mill was being routed from the East via the Northern Pacific. I went to the owner of the mill and asked him if he really meant as
1580 a business man to route that machinery over the Northern Pacific through the Portland gateway. He said, "Yes, for personal reasons I would like to do that." I replied, "Are you going to (2926) slap the Southern Pacific in the face by routing that machinery via the Portland gateway, over a foreign line that does not serve your mill, and then come around afterwards and ask for rates on slabwood, cordwood, mill feed, and local rates on lumber?" His answer was: "I had not thought of that. I will route that business via the Southern Pacific."

Comr. MCMANAMY. This group rate then only applies on what has been termed transcontinental business, does it not? That is,

for the intermountain country routes the rates are not the same by all routes, are they? There is a territory in there in which they are not?

A. Oh, yes; there is a local tariff naturally, but to Colorado and east the rates are the same. To Utah from western Oregon via Portland or via Ogden the rates are the same.

Fourth: It is the practice of the Southern Pacific as well as the Union Pacific system to purchase their car material, ties, bridge timbers, and supplies of lumber f. o. b. cars on their own rails. (2927.)

The Southern Pacific system is the largest purchaser of lumber mill railroad material in the western Oregon territory and these purchases likewise have a strong effect upon assisting that line in securing the long haul on the routing of commercial lumber from those mills.

Fifth: Large stocks of railroad ties, car material, etc., are purchased from the western Oregon mills by the D. & R. G. W.
1581 and Missouri Pacific, as a result of which this tonnage all moves via the Ogden gateway and the Denver & Rio Grande. In addition thereto these lines are favored by the mills with a large percentage of commercial shipments in order to invite favorable consideration in the matter of future purchases. A considerable portion of the lumber moving east consists of ties, car and railway material purchased by eastern lines in connection with which the purchasing agent of the eastern line controls the routing and designates over what lines it shall be routed.

The Union Pacific system buys its ties f. o. b. O.-W. R. & N. rails, that portion of the ties that are purchased in this territory. They also buy some ties from mills on the Oregon Short Line. But we have a tie-treating plant at the Dalles, and we buy ties f. o. b. our rails——

Exam. ROGERS. I notice in Mr. Buck's exhibit he has ties in (2928) there and applies a freight rate on them of, I believe, $3.21 a ton, as I recall. If those ties originated on the O.-W. R. & N. ~~these lines~~ would that rate be applicable?

A. Yes, sir; on all ties delivered to the Oregon Short Line the Oregon-Washington Railroad & Navigation Company, under the law, receives its freight charges. We can not transport material for any other unit of the system free over the Oregon-Washington Railroad & Navigation Company.

Exam. ROGERS. Then you regard these as Oregon Short Line shipments?

A. I suppose they would be so considered.

As previously stated the Union Pacific system purchases its supply of ties, car material, and so forth, in this territory f. o. b. O.-W. R. & N. rails, which means that a mill located on the Southern Pacific bidding on a Union Pacific order must pay the local rate from the mill to Portland.

1582 Sixth: With respect to commercial movement of lumber from the mills in western Oregon a very large percentage is sold through brokers and the routing is controlled by or through these brokers, whose headquarters are not only located in the lumber (2929) producing district, but in the cities of Portland, Tacoma, Seattle, San Francisco and east.

In many instances the consignee at destination will specify the routing, in which case either the broker, or if purchasing direct, the mill, usually observes the consignee's instructions.

I know one brokerage firm, wholesaler, here in Portland that controls and sells the entire output of two mills on the Southern Pacific Oregon lines.

Under all of these circumstances the railroad not directly serving a lumber mill has but very little to offer, even though the shorter line, to secure anything like a considerable share of the traffic.

Somewhat similar considerations are true with respect to the routing of all other commodities.

The Southern Pacific Railroad is the oldest established line in western Oregon. By reason of this fact most of the warehouses and industries handling carload traffic are located adjacent to and served by Southern Pacific trackage. In many instances these industries occupy ground leased from the railroad company in consideration of which, all things being equal, they would naturally route via the originating line. The local agent is in constant touch with their operations and is charged with the responsibility of securing the traffic.

1583 Shipments are also handled through brokers and outside agents (2930), the same as lumber, who specify routing and whose routing instructions are generally observed.

A very small percentage of the agricultural products, fruit, canned goods, and so forth, is sold by the producer to the consumer. The fruit grower takes his products to the packing house located on railroad tracks and operated either by a dealer or by an association, where the fruit is packed and sold to the best advantage in numerous ways.

Canned goods are generally sold to jobbers who in turn sell to wholesalers, any of whom may have a voice in controlling the routing of the shipments, through the medium of the orders for cars for loading.

Through orders for cars in connection with which routing is specified the agent receives first notice of any adverse routing, and, as stated, is in position to telegraph and endeavor to secure the long haul.

With respect to Mr. Wiggins' Exhibit No. 28, estimating revenue to the cross-State line based upon Mr. Teutsch's estimate of available tonnage as shown in his Exhibit 1 for the western Oregon counties therein named:

I have shown in my previous exhibit that over fifty per cent of the apples received during the years 1926 and 1927 at east Portland

from Southern Pacific-Oregon lines were for switch movement, local movement and movement via other (2931) routes than Union Pacific.

In 1926 the movement via Portland and Huntington to eastern destinations was 22 cars, and in 1927, 11 cars, showing a de-
1584 crease in 1927 as compared with 1926 of fifty per cent. Mr. Teutsch does not state that there are any newly planted acreages, therefore, I do not understand how there would be any created tonnage in five years. As a matter of fact the production of commercial apples in western Oregon has been decreasing for a number of years.

Taking the first item of five cars of apples for illustration, it is proposed by Mr. Wiggins to allow the cross-State line mileage prorate for the haul 189 miles, Crescent Lake to Crane, or a total of $188.70 for the haul of the five cars.

Under the present adjustment through Portland to O.-W. R. & N. would receive for this movement Portland to Huntington $480.00 so that by routing this traffic via cross-State line instead of through Portland the O.-W. R. & N. would receive less than one-half its present revenue.

I might add that this illustration that I give with respect to apples will apply with all the other commodities moving to eastern destinations.

Pears: While Mr. Teutsch referred to increased acreage coming into bearing, it is my understanding that there is no increased acreage of pears in Lane County. My previous exhibit does not show any carloads of pears (2932) received from the Southern Pacific at Portland for the years 1926 or 1927. This would not indicate any increase through the Portland gateway. I might elaborate on that a little bit and state that the pear movement from southern Oregon is through the Roseville gateway. It is a seasonal movement, and the packing houses require that the refrigerator cars be promptly spotted and be on hand for loading when required. The
1585 Southern Pacific supplies those refrigerator cars, bringing them north from California, and looks after the shipper's requirements in every detail, so that it is only natural that the shipper would favor, under those circumstances, the Ogden gateway, even if they didn't have a shorter route.

Comr. McManamy. Those cars are P. F. E. cars, usually, and owned jointly by the Union Pacific and Southern Pacific, are they not?

A. Yes, sir.

Green prunes: Mr. Teutsch referred to young orchards coming into bearing, and that his estimate of increase is based upon fifteen to seventeen per cent increase predicted by the bureau of economics in a recent study, trees to come into bearing in the next five years, which should be four carloads, page 195 of the transcript. (2933.) The prune growers have experienced difficulty in marketing this product for a number of years, it being generally considered that there was an overproduction, and some orchards have been neglected.

The prune crop in the Willamette Valley, north of the Umpqua Valley, this year is very light, to such an extent that there is insufficient quantity to supply the canneries with prunes for canning, with the result that contracts have been made by cannerymen for prunes from Milton-Freewater district in eastern Oregon and in Yakima Valley for shipment to Salem, Hillsboro, Portland, and so forth.

Green prunes from Roseburg, the same comment. I understand that there are not sufficient prunes in the Roseburg district to take care of the cannery requirements from the Willamette Valley.

1586 Fresh cherries move by express, and would be handled through Portland, account fast service.

Albany, Linn County, same comment. Strawberries—he refers to forty cars of strawberries. These strawberries are frozen in barrels or cans and sent to Portland cold storage plants for storage until sold, moving east from Portland direct. There would be no movement of this commodity via the cross-State line. There are no cold-storage plants in Linn (2934) County that would take care of these berries there.

Medford, Jackson County, pears: Entire movement east now via Roseville and Ogden. The distance to Granger via Ogden is 1,315 miles, via Portland 1,262 miles, via proposed cross-State line, 1,119 miles.

It should be remembered that shipments of pears require refrigeration and the icing stations are located with respect to movement via existing routes.

It is extremely doubtful if the shippers would change from an old established and dependable service to a doubtful service via proposed cross-State line.

Seeds: In 1926 the O.-W. R. & N. Company received at Portland ten carloads from Southern Pacific Company points in western Oregon, of which five went east via Marengo and Milwaukee and one via Union Pacific, the balance to local destinations. This commodity can not be considered as tonnage for cross-State line.

Nuts: In 1926 the Oregon-Washington Railroad & Navigation Company received from Southern Pacific at Portland seven carloads of nuts from all of western Oregon, of which five cars went to destinations east of Huntington. In 1927 ten carloads, of which four carloads went to destinations east of Huntington.

1587 Walnuts are also produced in Yamhill and Marion Counties. Therefore, unless there are new orchards coming into bearing (2935), the possibility of any tonnage of this commodity moving via cross-State line is very doubtful.

Broccoli: Mr. Wiggins is taking the average movement for several years to all markets, east and west; that is, 379 cars, and sends it all over the cross-State line to Chicago and New York.

My exhibit previously presented shows that the Oregon-Washington Railroad & Navigation Company handled to points east of Hunt-

ington in 1926, 631 cars; in 1927, 222 cars; and in 1928, 164 cars, indicating a gradual decrease in the movement. Broccoli is a highly perishable commodity requiring perfect refrigeration, and because of the icing facilities now available via the present routes there is not any likelihood of this commodity moving over the proposed cross-State line.

I might say with the completion of the Alturas line and making that a through route, with proper icing facilities that business would in all probability go that way, but I am looking upon the cross-State line as a local line.

There are no icing facilities upon the present Alturas line as it may exist from Klamath Falls.

Exam. ROGERS. In all your comments, Mr. Lounsbury, you are giving no weight to the suggestion of Mr. Newell about the arrangement between the cross-State line and the Southern Pacific, are you? (2936.)

A. Yes; I am having in mind Mr. Newell's statement that he would run a mixed train across that line.

Exam. ROGERS. Well, I was wondering if you also had in mind the obligation imposed in paragraphs 10 and 11 in section 1, where the carriers must furnish adequate train service, regardless of what Mr. Newell suggests.

1588 A. Well, the train service would be adequate, undoubtedly, for the traffic that would be received, but from my knowledge of that territory and my experience in that territory in the last twenty-five years I think Mr. Newell's ideas as to the business that would move over that line are not based on conditions of fact.

Exam. ROGERS. Well, I recognize that, that Mr. Newell's basis is on an arrangement between the Southern Pacific and the Union Pacific, or the O. W., if the O. W. buil[illegible] this line.

A. If the arrangement is no better than the present one via the Portland gateway, why, the cross-State line would be no better treated.

Exam. ROGERS. That is probably true, but if an arrangement should, as Mr. Newell suggests, whereby it would be more profitable to both the Southern Pacific and Union Pacific to route the traffic that way, be carried into effect, do you have any doubt about the train service in order to consummate that program?

A. Why, if that arrangement were carried in effect—that is, if (2937) the line were built and that arrangement carried into effect, why, I would think there would be pretty good train service across that line.

Exam. ROGERS. Yes; but that is what I had in mind—in your comments, you have given no effect to that suggestion of Mr. Newell's?

A. No, sir; I am taking the conditions as they now exist.

Exam. ROGERS. And assuming that this other thing will not be brought about.

A. Yes, sir.

Exam. ROGERS. That Mr. Newell talked about? (2938.)

A. Yes, sir; I am not considering that at all.

1589 Canned goods: Of the 387 cars delivered to the Oregon-Washington Railroad & Navigation Company at east Portland in 1927, 202 were for switch movement. A few may have been for wholesale houses at Portland but the bulk was switched to docks by the Oregon-Washington Railroad & Navigation Company for forwarding by boat, amounting to 53 per cent of the total; 71 cars or 19 per cent moved to points east of Huntington.

There are canning plants located in all of the Willamette Valley counties, the largest operations being at Salem, and this 19 per cent represents the entire movement from western Oregon, via Portland, Oregon-Washington Railroad & Navigation. Furthermore, the Southern Pacific maintains special rates into packing centers on fruits, berries, and vegetables from outlying points which give them the preference in securing the long haul on the outbound movement.

Mr. Wiggins shows a total of 134 cars for the cross-State line, which is almost twice as much as we handled in 1927 from all of western Oregon via the Huntington gateway. It is very questionable, therefore, that any of this traffic can be considered as reliable tonnage for the cross-State line.

Dried fruits: In 1926 we had no movement, and in 1927, 2 cars to points east of Huntington via the Huntington gateway from all of western Oregon. That is, other than prunes.

Mr. Wiggins in Exhibit 28 shows 25 cars and revenue thereon for the (2939) cross-State line, as against two cars from all western Oregon.

Dressed poultry: In 1926 there was no movement via Portland and Oregon-Washington Railroad & Navigation.

In 1927, six cars from all of western Oregon via Portland and Huntington gateways.

1590 Mr. Wiggins in Exhibit 28 shows 10 cars for the cross-State line as created traffic.

Eggs: As previously explained, the egg packing house at Eugene is located on the Oregon Electric, and shipments will continue to move that way. There was no movement through Portland and Huntington gateways in 1926 or 1927 from western Oregon.

Cattle: Eugene to Crane: Mr. Wiggins shows in Exhibit 28, 66 cars. By reference to page 33 of Mr. Wiggins' Exhibit 26 there was one car of livestock moving off the Southern Pacific to Idaho via the Portland gateway, and 1 car westbound. This car evidently moved from Idaho to the Oregon State fair at Salem for exhibition.

On page 194 of transcript, August 3rd, Mr. Teutsch states:

"As the irrigated valleys in eastern Oregon develop, requiring the stocking of dairy cattle, we figure the annual movement of 2,000 head of dairy cattle to eastern Oregon from (2940) these counties via the cross State, giving 66 cars."

The increase in dairy cattle in southern Idaho may take care of the requirements over the period of time that the irrigated sections are in process of development.

Furthermore there are other counties in western Oregon north of Linn, Benton and Lane Counties where dairying is carried on to a greater extent, and any cows required may move from these northern Willamette Valley counties via the Portland gateway due to better facilities for feeding enroute.

Furthermore it is very doubtful if 66 carloads of dairy cattle could be purchased in one district. It is usually the custom of the purchasers to send a representative to various dairy districts to look for cows, and any newly irrigated acreage in southern Idaho or Malheur County may be supplied from western Washington, eastern Idaho, Utah or even Wisconsin, so that it is possible that the cross-State line might not secure any movement of cows from
1591 the lower Willamette Valley counties to southern Idaho.

Sheep: Mr. Wiggins in Exhibit 28 shows 35 cars from Klamath Falls to Chicago and New York. It is not likely that the Southern Pacific and Great Northern would join in through rates with the Union Pacific system lines which would deprive them of any of this traffic, and even if they did it is doubtful if there would be any movement via cross-State line due to fact that the sheep may move to Klamath Falls (2941) by rail for grazing in transit, in which event the movement east would be over the line handling the local movement into the grazing point. Mr. Wiggins shows 309 cars from Bend to Chicago and New York. The same comment with respect to movement from Klamath Falls equally applies to movement from Bend. During the year 1927 the Oregon-Washington Railroad & Navigation Company handled 127 carloads of sheep from Des Chutes branch to eastern markets, of which 21 cars consisted of sheep purchased by the Russian Government moving to New York for export, so that the actual movement to eastern markets for the year 1927 was 46 carloads.

Wool: Mr. Wiggins shows in Exhibit 28, nine cars from Klamath Falls, 40 cars from Bend to Boston. The wool from this territory moves to Portland for shipment to Boston via the canal. There would be no eastbound movement by rail.

Sheep: From Fort Rock, Mr. Wiggins shows 86 cars to eastern points. It is my information that there are not over 5,000 head of sheep in the Fort Rock and Christmas Lake Valleys, and I have therefore estimated movement to the east of 18 cars, or 195 tons, from milepost 230, which is the tributary point on the proposed cross-State line to the Fort Rock and Christmas Lake Valleys. (2942.)

Wool: From Fort Rock to Chicago and Boston, Mr. Wiggins shows 14 cars. Wool moves to Portland as previously explained.

1592 On page 4 of Mr. Wiggins' Exhibit 28 is shown 385 carloads of corn from Omaha to Eugene. During the year 1927 the Oregon-Washington Railroad & Navigation Company delivered to the Southern Pacific at Portland 246 cars of corn for all points on the Southern Pacific lines in western Oregon and yet he shows 385 to the cross-State line.

There would be no difference in the freight rate on corn and other feeds from Iowa, Nebraska, and so forth, to Willamette Valley points if the cross-State line were constructed, and this traffic would undoubtedly move in through westbound trains via the Huntington and Portland gateways.

Furthermore, this grain is subject to milling in transit rates. A great deal of it is milled in Portland by the Portland mills.

Feed: Crane to Eugene, Corvallis, and so forth, Mr. Wiggins shows 723 cars.

I assume by feed is meant millfeed, the product of flour mills, or barley and oats as well as poultry feed.

There are flour mills in western Oregon that now supply the feed requirements of the dairy producers, in some instances within hauling distances from the mill, but in the event there should not be sufficient millfeed produced by the (2943) mills in western Oregon the Portland mills can more than supply the demand.

In addition there is abundant supply of feed to be had from the Columbia River counties in Oregon east of Portland, from which distance and rates are lower than would be via the cross-State line from southern Idaho mills or Harney County, as shown on previous exhibit.

There are cereal mills at Tacoma and Seattle, also, that sell millfeed in western Oregon and are less distant than southern Idaho.

1593 As previously shown during the year 1927 the Oregon-Washington Railroad & Navigation Company delivered to the Southern Pacific at East Portland for all of western Oregon 37 cars of barley and one car of oats. I am unable to show the number of cars of millfeed as our records show flour and feed under the same heading.

Poultry feed principally moves from cereal mills at Portland, Tacoma, and Seattle producing this product in large quantities.

This estimate of 723 cars of feed to move over the cross-State line is absurd to anyone familiar with the situation.

Mr. Wiggins shows hay from Crane to Eugene and other points 702 cars.

I have prepared a statement showing the rates on hay to Willamette Valley points from Hermiston, Stanfield, Echo, Klamath Falls, Ontario, Oregon via Crescent Lake—from the (2944) latter point is shown two sets of rates, which I wish to present as an exhibit.

(Said statement was thereupon received in evidence, marked "defendants' Exhibit No. 62, Witness Lounsbury.")

It will be noticed that in connection with the hay rates via Crescent Lake I have also shown the continuous mileage rate for joint haul applying intra-State, as well as the combination on Crescent Lake.

Page 2 of this statement shows the old and new rates from eastern Oregon and from Yakima, Washington to Willamette Valley points prior to the establishment of the continuous intrastate mileage rates.

Page 3 shows rates that may be applied via Crescent Lake if proposed cross-State line is constructed, in one case using combination on Crescent Lake, the other continuous mileage for joint line haul.

1594 In this connection would state that since the construction of the Great Northern from Bend to Klamath Falls the joint line mileage basis used in this statement has not been adopted for joint hauls between the Southern Pacific and Great Northern.

This statement shows that rates are lower from eastern Oregon points, namely Boardman, Umatilla, and Hermiston, the alfalfa-hay-producing district, to Eugene than would obtain (2945) from Ontario to Eugene if either the joint continuous mileage or combination rates were adopted.

During the year 1927 the Oregon-Washington Railroad & Navigation Company delivered to the Southern Pacific at East Portland for all western Oregon points 260 carloads of hay, approximating 3,790 tons, on basis of 14½ tons to the car, which is the average loading.

Mr. R. C. Crockett, professor of economics, University of Oregon, in previous hearing March 29, 1924, page 529 of transcript, testified in reply to inquiry:

"How much of this great quantity of hay that is needed in the Willamette Valley, alfalfa hay, will come by way of the new line?

Answer. "I have put the figure at 450,000 tons for the first five years."

Question. "Do you know what the output of the Klamath country is in that kind of product?"

Answer. "I have estimated that perhaps about 25 per cent of that might come from the Klamath country."

Twenty-five per cent of 450,000 tons would be over 150,000 tons.

Mr. Mulchay has made a check of movement from Klamath County to all points in western Oregon for the period September 1st, 1926, to May 31st, 1928, which shows a total of 27 cars

1595 (2946) from Klamath County to western Oregon.

The average carload of hay is 14½ tons, which would make total tonnage of hay from Klamath County during a period of 20 months, 391 tons.

It appears from testimony presented during this hearing that the alfalfa hay grown in Klamath County is utilized for feeding livestock, and it is therefore equally fair to assume at this time that alfalfa hay produced in Harney County will also be utilized for feeding livestock—range cattle, not dairy cattle. They have severe winters over there, and the alfalfa hay that they raise in the Harney Valley is used for hay for stock that is ranged.

Exam. ROGERS. What do you have in mind in western Oregon?

A. What I had in mind here to show, that at the previous hearing the estimate that over a hundred thousand tons of alfalfa hay would move from Klamath County to western Oregon, when the

Natron cut-off was completed, and in 20 months since that line has been constructed there have been 27 cars of alfalfa hay moved from Klamath County, which is a better alfalfa hay-producing district than Harney County, and in (2947) this hearing the testimony was to the effect that the supply was limited because they were using it in Klamath County to feed all kinds of stock. Now, the same assumption is absolutely correct with respect to Harney County.

Mr. ELLIS. In fairness to Mr. Crockett, who is now dead, I think we should have the record clear on all of these lines, and not merely on the Natron cut-off, and it was on ultimate consumption, and not upon the completion of the construction, and not on the consumption under existing conditions.

Apples: Crane to San Francisco and Los Angeles, 138 cars—still dealing with the estimate of revenue and earnings via the cross-State line.

1596 I have previously covered this proposed movement in analyzing Mr. Teutsch's Exhibit No. 1, to which I would add that the rate on apples from Medford to San Francisco is 49½ cents, from Hood River 35½ cents rail and water, and from Yakima 60 cents rail and water, as against 98 cents from southern Idaho to San Francisco via Wells or Ogden, at the present time.

The movement of apples from southern Idaho to Los Angeles will continue to move via the Union Pacific through Salt Lake (2948), which is the shorter distance.

Potatoes: Crane to San Francisco and Los Angeles, 174 cars. Explanation of this movement is covered in my remarks analyzing Mr. Teutsch's Exhibit No. 1, to which I would add that there was shipped from the Yakima Valley through Seattle and boat to San Francisco and Los Angeles, principally San Francisco, during period July, 1927, to March, 1928, inclusive, approximately 1,200 carloads.

Potatoes, Crane to Roseburg—35 carloads.

Under heading "Douglas County" in his Exhibit No. 1 Mr. Teutsch shows 35 cars of potatoes available for movement over proposed cross-State railroad.

United States Department of Agriculture, Division of Crops estimates, under heading "Oregon crop production, 1926" shows 3,095,375 bushels of potatoes in western Oregon, and 1,578,075 bushels produced in eastern Oregon counties. It is, therefore, difficult to conceive of movement of 35 cars from southern Idaho to Roseburg.

Horses and mules: Crane to San Francisco, Los Angeles, Portland, and Seattle, 75 carloads divided between Crescent Lake and cross-State junctions.

1597 There is a regular movement of range horses from eastern Oregon points under special rates to the horse-meat packing (2949) plant and fertilizer plant located at Kenton, Oregon, a suburb of Portland. Some of the range horses from southern Idaho are moving to similar plant located at Butte, Mont.

At present time there is a representative of the Russian Government in this territory who has already contracted for 1,750 head.

Under these circumstances the regular movement of range horses from eastern Oregon and southern Idaho will continue to Portland via the Huntington gateway on account of the shorter distance.

Since the Oregon-Washington Railroad & Navigation have no through joint rates with the Oregon Electric on any movements that are competitive with the Oregon Electric or Hill lines, the Great Northern and Northern Pacific, it is not likely that through joint rates would be established via cross-State junction.

Cattle: Crane to San Francisco, Los Angeles, Portland, and Seattle, 988 cars divided equally to the four points named.

The movement of cattle from southern Idaho and Malheur County is covered in my analysis of Mr. Teutsch's exhibit. I have, however, conservatively estimated from milepost 133 near Crane possible movement of 3,350 tons, approximating (2950) 258 cars of cattle to Portland via Crescent Lake, and 3,375 tons, approximating 260 cars, to San Francisco via Crescent Lake, making total of 517 cars that might be expected to move over the proposed cross-State line from the Crane-Burns district.

Page 5, Mr. Wiggins' Exhibit 28:

Cattle: Fort Rock to San Francisco, Los Angeles, Portland, and Seattle via cross-State junction and Crescent Lake,
1598 equally divided as to markets, 84 cars.

My information is that there are not to exceed 3,000 head of cattle in the Fort Rock and Christmas Lake Valleys, therefore, I have estimated movement of 650 tons, approximating 50 cars, from Fort Rock to Portland via Crescent Lake.

Sheep and hogs: Crane to San Francisco, Los Angeles, Portland, and Seattle, 352 cars, equally divided as to markets.

Sheep from the territory in question move east.

As previously explained in my analysis of W. L. Teutsch's Exhibit No. 1, in 1926 there were 2 carloads of sheep shipped from off the Brogan and Oregon Eastern branches to southern California and no hogs shipped to California from off of these branches.

There were 179 cars of sheep to Oregon and Washington markets and 10 cars of hogs. Account of shorter distance to Oregon and Washington markets this business will undoubtedly continue (2951) to move via the Huntington gateway.

Butter: Crane to San Francisco—64 cars.

The movement of this commodity from southern Idaho to California was explained in my analysis of Mr. Teutsch's Exhibit No. 1.

It should be borne in mind that the distance via Salt Lake to Los Angeles is shorter than via the proposed cross-State line.

Poultry: Crane to San Francisco and Los Angeles—2 cars. The same explanation as to butter applies as to poultry.

Hogs: Crane to San Francisco, Los Angeles, Portland, and Seattle—53 cars, equally divided as to markets. Previous explanation has been made concerning this movement. (2952.)

1599 The same can be said as to calves and hogs, Crane to San Francisco, Los Angeles, Portland, and Seattle—four cars.

Pages 6 to 16, Mr. Wiggins' Exhibit No. 28:

In view of the foregoing analysis showing the actual movements, the estimated tonnage and revenue based on created traffic for the first, third, fourth, and fifth years is in my opinion unsound, unreasonable, and cannot be relied upon to sustain or justify construction of cross-State line as against existing movements through the Portland gateway, as far as western Oregon is concerned, and the Wells and Salt Lake gateways as far as southern Idaho is concerned.

In my estimate of the revenue and earnings for the cross-State line I have depended upon local traffic moving on and off the line between Crane and Burns. I did not undertake to assign to the cross-State line any traffic now moving over the present lines which would if diverted to the cross-State line take the revenue from the present line to sustain the cross-State line, and in many cases take more revenue from the existing lines than the cross-State line would receive.

In his Exhibit No. 8, Mr. Samuel L. Newton presents a statement showing carloads received at Nyssa, Ontario, Crane, and Burns from California points that might be routed via proposed route across Oregon.

On page 1 the only commodity moving from California to Nyssa is a car of automobiles from Melrose. (2953.) I am dealing now with Mr. Newton's Exhibit No. 8—automobiles take first class rate, and the combination on Portland is $2.43½ per one hundred pounds as against combination on Crescent Lake via cross-State line of $3.14 per one hundred pounds; therefore, this business would continue to move via Portland.

1600 On page two of said exhibit showing carloads received at Burns are three cars automobiles from Melrose, Calif., two cars sugar moving from San Francisco via steamer to Portland, thence rail. With respect to the automobiles from Melrose to Burns the present first class rate via Portland is $3.46½ per one hundred pounds, as against combination on Crescent Lake using the Oregon distance scale of $2.86 per one hundred pounds.

The class rates from Portland to southern Idaho and Burns Branch are being reduced effective October 1, 1928, as result of Interstate Commerce Commission docket 19459, State of Idaho ex rel Public Utilities Commission of Idaho vs. Oregon Short Line et al., decided July 5, 1928, prescribing continuous distance rates from Portland to branch line points in Idaho. The Oregon Short Line and Oregon-Washington Railroad & Navigation Company voluntarily readjusted the rates from Portland to points on the Oregon Eastern branches effective same date so that effective October 1, 1928, the rate on automobiles via Portland from (2954) Melrose to Burns will be $3.09 per one hundred pounds, as against $3.46½ at present.

The water and rail rates on sugar from San Francisco to Burns through Portland is $1.65, as compared with all-rail combination on Crescent Lake $1.27.

Effective October 1, 1928, the water and rail combination through Portland will be $1.33.

The present rate on sugar is at present based on fifth class rate beyond Portland. This situation however would not obtain at points east of Riverside.

1601 It is also reasonable to assume that were the cross-State line constructed the rates through Crescent Lake would be no lower than rates at least by water and rail through the Portland gateway.

On page 3 is shown one car of roofing from Paraffine, Calif., to Burns on which the combination through Portland figures $1.01 per one hundred pounds as against $1.28½ combination on Crescent Lake.

Two cars of sugar already explained.

Four cars of automobiles from Melrose and one car of baker's ovens from Emeryville, Calif., on which the rate via Portland is $1.41 per one hundred pounds, and the Crescent Lake combination would make $1.45½.

Pages 4, 5, 6, 7, and 8 show carloads received at (2955) Robinette, Vale, and Ontario, to which points of destination rates from California points of origin are lower through Portland than would be via Crescent Lake and the cross-State line.

The last page shows receipts at Crane, namely four cars of automobiles from Melrose, from which present rate via Portland is $3.26½ and combination on Crescent Lake would make $2.77½.

Effective October 1st the rate from San Francisco to Crane via Portland will be $2.89.

From this it will be seen that the only commodity affected would be automobiles moving from Melrose to Crane and Burns under first-class rates.

I have prepared a statement showing the class rates in cents per one hundred pounds at present in effect from Portland and San Francisco to Ontario, Crane, and Burns, and what the rates will be October 1st, 1928, comparing same with combination via Crescent Lake.

1602 (Said statement was thereupon received in evidence, marked "defendants' Exhibit No. 63, Witness Lounsbury.") (2956.)

This statement shows that from Portland to Ontario the class rates are lower than would be in effect via cross-State line. From Portland to Crane the rate of $2.17 first class effective October 1st will be slightly higher than Crescent Lake combination of $2.05½ Portland to Crane, and relatively the same situation as to class rates Portland to Burns.

From San Francisco to Ontario present class rates via Portland water and rail and all rail will be lower than via Crescent Lake.

From San Francisco to Crane water and rail rates effective October 1, 1928, $2.66½ first class will be lower than the first-class rate through Crescent Lake of $2.77½, and from San Francisco to Burns the water and rail rate via Portland of $2.88½ effective October 1, 1928, will be lower than rate via Crescent Lake, $2.97½.

In order that the commission may have some understanding of the rate adjustment between San Francisco and northwest points, I desire to submit the following:

Long established steamer lines are operating between (2957) California ports on the one hand and Oregon and Washington ports on the other hand, applying very low class and commodity rates. The Southern Pacific has relief from the fourth section by reason of water competition to apply lower rates, class and commodity, between San Francisco and Portland than apply at directly intermediate points. Therefore, generally speaking, the rates between San Francisco and Crescent Lake would uniformly be higher than rates between San Francisco and Portland.

As result of this situation, rates between San Francisco and Oregon, Washington, Idaho, and Montana are usually made by
1603 using steamer class and commodity arbitraries from San Francisco to Portland or Puget Sound, plus the rail rates from Portland and Puget Sound ports to the interior.

The all-rail rates are also made in like manner by using proportional rates to Portland, plus the all-rail rate from Portland to Oregon, Washington, and northern Idaho points, and in some instances through rates are made without regard to the Portland combination so long as such rates do not violate the fourth section.

For this reason Portland is now the basing point through which and on which class and commodity rates are made between San Francisco and the Northwest territory.

For example, on canned goods the steamer arbitrary from San Francisco to Portland used in making through rate to (2958) Ontario, Oregon is 17½ cents, plus the canned goods commodity rate from Portland to Ontario of 49 cents, making through rate 66½ cents.

As against the steamer arbitrary of 17½ cents San Francisco to Portland the Southern Pacific applies 22 cents on canned goods to apply in connection with tariff applicable to destinations east of Portland in Oregon, Washington, and northern Idaho, but this arbitrary does not apply to points east of Huntington, so that the through rate by rail on canned goods from San Francisco to Ontario would be the local rate of the Southern Pacific to Portland, 28½ cents, plus 49 cents, or 77½ cents. The rate on canned goods from San Francisco to Crescent Lake is 71 cents. From San Francisco to Portland it is 28½. (2959.)

I think it was Mr. Magladry who testified that the average time on lumber from Eugene to Chicago via the Southern Pacific,
1604 through the Roseville gateway, is sixteen days, the minimum fourteen or maximum eighteen. I have taken a memorandum of 10 cars moving from Longview, Wash., 10 cars from Portland and 10 cars from off the Southern Pacific, 5 originating at Eugene moving via Portland, and the average from Longview and from Portland to Council Bluffs is seven days and four hours, and to Chicago nine days.

Exam. ROGERS. Do you think that 16 days or 14 days is the representative time via the Roseville route?

A. No; I think the time is a little better than that. I think that Mr. Magladry's figures are too extravagant on the time. I think the Southern Pacific is doing better than that.

Exam. ROGERS. I had in mind that the perishable movement was nine or ten days. According to the impression I get here they had better put some of the perishable on the lumber trains; it would get there quicker.

A. Well, some testimony has been submitted here to the effect that by reason of the fast time on lumber to the East the lumber yards in the East were not now carrying stocks, as a result of which the lumber yards here must carry larger (2960) stocks and the eastern consumer orders direct from the lumber yard here. It was the shortening of time by the western carriers that brought about that condition.

I have a record here of five cars from Eugene that moved through Portland destined to Chicago, during the period from May 16th to July 17th, this year. The minimum time to Chicago was ten days from Eugene via Portland gateway, and the maximum was thirteen days, and there was just the one car made the thirteen days. The other four made ten and eleven days.

1605 Comr. MCMANAMY. Are those all the cars that moved during that period?

A. To Chicago. I told our manifest clerk to take the last five cars from Eugene, and this is what he gave me. We carry a manifest record.

Exam. ROGERS. What is the running time on perishables from Eugene to Chicago?

A. Our perishable schedule from Portland to Council Bluffs is 145 hours, or six days and one hour; to Chicago 175 hours, or seven days and seven hours. From Eugene to Portland the schedule could be accomplished easily in one day. That would cover the interchange here. (2961.) That would be eight days and seven hours on perishables to Chicago as against ten days on lumber; but our regular schedule on all merchandise freight other than fruit blocks from Portland to Council Bluffs is seven days and ten hours, and to Chicago eight days seventeen and a half hours.

Exam. ROGERS. And do you put lumber through the Portland terminal and the other terminals as quickly as you do perishables?

A. Just about. All perishable freight coming off the Southern Pacific here has to be re-iced. It does not take long, because they have facilities at east Portland for icing.

Exam. ROGERS. It is a matter of but a few minutes, isn't it?

A. Yes; but it requires some switching, and the lumber is just switched (2962) from one yard to another, and our train goes out of here at night.

1606 Comr. MCMANAMY. What do you mean by fruit blocks out of Portland?

A. We make up a fruit block at Rieth, but our fast manifest train carries the fruit to Rieth, where the block is made up every day. It is made up just three miles this side of Pendleton, Oreg., and there the fruit block carries all fruit originating in western Oregon and west of Pendleton, and in Washington, including the Yakima Valley, north of Wallula.

Comr. McMANAMY. Together with sufficient other commodities to make up your manifest tonnage?

A. Yes, sir. But the fruit block runs every day, even if there is only one car. Those fruit trains run whether we have other tonnage or not.

Exam. ROGERS. Have you any idea as to the number of trains that do have full engine tonnage; that is, fruit trains?

A. That depends upon the season. If it is in the fruit moving season the trains have the tonnage; that is, in the peak movement. (2963.) They have the tonnage in the fruit moving season.

Comr. McMANAMY. And if it is not in the fruit moving season they have something else?

A. It is all perishable. It does not have to be fruit. There are other perishables moving in refrigerator cars right along.

Comr. McMANAMY. And if they don't have the tonnage of perishables they have the tonnage of other freight?

A. Yes, sir. But they do run that train every day, just the same, and I don't think there is any time but what there are some
1607 perishable cars on that train. We put other freight on those perishable trains to make up the tonnage. That train wouldn't run with just one car. The train does not run light if there is tonnage available to go. And it is the business of our operating officers to see there is tonnage available to go on that train rather than to send it out light. We have put lumber on that train, where we have had a request (2964) to expedite a car.

Now I have taken an average of ten cars, moving two from Silverton (in Marion County), seven from Eugene, and one from Albany, via Portland to Chicago and the average time was ten days and ten hours. That was lumber. From this explanation you will see that the short time transportation of lumber spoken of is a fact from here east.

The WITNESS. I understand you to mean that the railroads were handling lumber from the Pacific coast to the East in reasonably short time?

Exam. ROGERS. And what I had in mind was your statement that the carrying of less lumber on hand by the eastern dealers was due to this expedited service.

A. Yes, sir; that has brought it about, as against the fact that lumber used to run all over the line, but——

Exam. ROGERS. Yes; I was going back to the statement of Mr. Magladry and some of the other witnesses who said that the time in

transit was an element, because the dealers were carrying short stocks.

A. But that is only in exceptional cases. I have here a letter written by our Chicago representative to me, dated Chicago, June 15th, referring to a movement of ten cars of lumber from Veneta, Oreg., on the Southern Pacific-Oregon lines, from which I will quote as follows:

1608 "Your letter, file blank of the 10th, relative to an order for 10 cars of lumber placed by Blank Lumber Company, Chicago, with Blank Lumber Company, Veneta, Oreg., on which S. P., D. & R. G., U. P., C. & N. W. routing had been requested account slow time in transit desired on these cars." (2966.) We had taken up by this letter, to which he refers, the matter of securing the entire haul from Ogden east on these ten cars of lumber, but the consignee had routed them via the D. & R. G. and the reason our representative gave was because he wanted slow time on these cars.

Exam. ROGERS. Where would the slow-up come about?

A. Well, if the lumber was put on the Union Pacific at Ogden and moved right straight through on a through train, it would probably make better time than if it was interchanged with the Denver & Rio Grande and went through Denver and was then delivered back to the Union Pacific at Denver.

Mr. ELLIS. Does that letter indicate why they wanted slow time on those particular cars?

A. No; but from my own experience I can tell you that that is only one of a number of cases where the lumber moving may be handled by a broker who has not sold the lumber, who is just handling it for the mill, and he contracts it out unsold and he will send it over a circuitous line to sell it while it is in transit and——

The date of that letter is June 15, 1928. We have had a number of complaints from our soliciting representatives, not only in the Willamette Valley but Grays Harbor and Puget Sound, that they would not route the business via the Union Pacific because it would get (2967) by the diverting point before they could catch it.

1609 That is, the lumber that is moving unsold and on consignment and to be diverted in transit; and that amounts to something.

Exam. ROGERS. You don't have that trouble with the Southern Pacific?

A. I would rather not answer that.

Now in that connection, since I have given you the schedules on the lumber, some mention has been made of the movement of the cauliflower—of the celery from the Lake Labish Celery Union at Brooks, Oreg., to the east and I have here a memorandum of the distribution of this celery from Brooks for the year 1927. There was a total of 411 cars, of which 125 moved via Portland and the Union Pacific, 132 moved via Portland, the S. P. & S.—that is the Spokane, Portland & Seattle, and either the Northern Pacific or the Great Northern; 57 moved via Ogden, S. P. and U. P.; 21 by El

Paso; 65 to California, local; 10 to Oregon, local; 5 to Spokane, Portland & Seattle destinations, local.

In connection with that celery movement from Brooks—I have been in pretty close personal touch with that—at the beginning of the season the celery started moving via Portland and the Union Pacific. It was sold through an eastern commission house or an eastern wholesaler. The first movement (2968) from the warehouse started via Portland and Union Pacific, and then it stopped, and I called on the manager of the association and asked him why it was he had stopped shipping by the Union Pacific, and he was then loading cars at the warehouse, and he said, "Why, your time is too fast." I said, "What do you mean by that?" He said, "I mean that the first cars that were shipped were sold and we were anxious
1610 and in a hurry to get them to destination." He said, "The cars we are shipping now are not sold and we want all the time in transit we can get to sell them. So I am routing these via Ogden and via the Northern Pacific and Great Northern." I said, "Aren't you giving us any?" He said, "No, because your time is too fast." I said, "What time are you getting by the other lines?" He said, "I am getting six days to Missouri River by the Union Pacific, and eight and nine days via the other routes." I said, "Well, I will take your celery off of the fruit block, if that is what you want." "Well," he said, "if you will slow it up a couple of days, I will give you some of it." And as a result of that he started in routing again through the Portland gateway and we took off the fruit blocks 33 cars of that celery, and put them on the regular manifest train.

I thought it might be advisable and of interest to the commission to make some (2869) mention of the routing of lumber, or the application of rates and routes on lumber from western Oregon through the Portland gateway. Lumber rates apply from all points on Southern Pacific on the old main line, Leona and north, and from the new main line, Klamath Falls and north via Portland and Northern Pacific Railway, except from points on the Klamath Falls line rates apply only in connection with the S. P. & S. and Northern Pacific to all territory to which the Northern Pacific carry rates from Portland. That means you can route a car of lumber to-day from Eugene to the connection with the Northern Pacific or Great Northern direct to Portland, they could take it by their long lines through Tacoma and Seattle—through Tacoma with the
1611 Northern Pacific, or Seattle in connection with the Great Northern, if they wanted to handle that business direct, or it can be taken by the S. P. & S. to Spokane and then turned over to the Northern Pacific or Great Northern. You understand, these rates when put in with the Northern lines were put in either direct through the Portland gateway or in connection with the S. P. & S. to Spokane.

Lumber rates apply from all territory, Leona and north, on the old main line, and Oakridge and north, on the Klamath Falls line

via Portland and Great Northern Railway to Minnesota Transfer and east thereof, also via Billings to points on the C. B. & Q. Railroad. (2971.)

Rates also apply from the above described territory via Portland, Spokane, Portland & Seattle Railway, Spokane, thence on the Northern Pacific or Great Northern Railway.

Via Union Pacific system lines: Rates apply from all Southern Pacific-Oregon lines via Portland and Union Pacific system to Missouri River points, Chicago and east.

There are no rates via Portland, O.-W. R. & N., Spokane and Great Northern to any destination. Rates apply from Southern Pacific points, Leona and north, and Oakridge and north, via Portland, O.-W. R. & N., Spokane, and S. I. Railway to Minnesota Transfer, Duluth and Chicago, but no rates are carried to points east of Chicago via this route.

Rates from points Leona and north, and Oakridge and north, apply via Portland, O.-W. R. & N., Marengo and C. M. & St. Paul Railway to St. Paul, Minnesota Transfer and points north of the Omaha-Chicago line. No rates are carried to points east of Chicago via this route.

Now, in connection with the routing of lumber, before the 1612 Northern lines acquired the Astoria & Columbia River Railroad operating between Portland and Astoria, which is now a part of the S. P. & S. through rates on lumber applied from Astoria and intermediate points to Portland and the lower Columbia mills via Portland and the Union Pacific to all eastern (2971) destinations—via Portland, O.-W. R. & N., Short Line and Union Pacific, to all eastern destinations.

As a result of a complaint and hearing before the Interstate Commerce Commission the S. P. & S., after taking over the Astoria & Columbia River Railroad, succeeded, by order of the commission, in canceling the rates via Portland and the Union Pacific to the eastern destinations from Astoria and all points beyond Portland on the S. P. & S. Railroad, on the ground that the parent lines are entitled to the long haul; and you can figure out many distances through the Portland gateway that would shorten the route more than is under consideration in this case.

Comr. McMANAMY. Then the substance of what you are testifying to is that on request of the shippers the carriers will not only slow up movements and allow the use of their refrigerator cars for storage but will also haul them around the country while they are furnishing that free storage, and that they will do the same on lumber; is that right or wrong?

A. Now, I would not put it just that way, Mr. Commissioner.

Comr. McMANAMY. Well, you didn't put it just that way, but that is my understanding of it. I want to know if it is right.

A. The shipper can avail himself of either the fast or the slow time, whichever he requires.

Comr. McManamy. Well, if he avails himself of the fast time (2972) demurrage begins to accrue about two days earlier
1613 than if he avails himself of the slow time on shipments that are not sold when the car reaches its destination?

A. That is true, and that is one of the considerations. Besides, by the slower route he has the time to sell and divert in transit, and he does not have to rush so much, or sacrifice the sale, if it is necessary, in order to dispose of it before arrival at destination.

Comr. McManamy. And that practice is followed with respect to lumber shipments, celery shipments, and fruit shipments?

A. Yes, sir.

Exam. Rogers. If you have a car of perishables at a diversion point that is held there for reconsignment, the shipper, under the perishable protective tariff, would pay for the ice applied there, wouldn't he?

A. Yes.

Exam. Rogers. Whereas, if he strings the car along en route and it is a couple of days longer coming from origin to the diverting point, the carrier takes care of the ice, of course.

A. Yes; under the through charge. (2973.)

Comr. McManamy. That also applies to the per diem on the car?

A. Well, the carrier takes care of that, too.

Comr. McManamy. Of course, on refrigerator cars it is mileage, but on the ordinary freight it is per diem?

A. Yes, sir. I have just one more comment. The governor yesterday spoke about the hop movement east from the Willamette Valley. Considerable of that movement is by the canal. In 1926 the Southern Pacific-Oregon lines did not deliver to us any hops for eastern movement. In 1927 the Southern Pacific-Oregon lines delivered us three cars destined to points east of the Missouri River.

1614 Exam. Rogers. Well, I gather from your statement, Mr. Lounsbury, that there is a difference of from two to three days on perishable freight from western Oregon as to whether it comes via Portland or goes by the Southern Pacific to eastern destinations?

A. Now, as I understand that, Mr. Examiner, the time from Portland to Chicago is comparable with the time from Roseville, Calif., to Chicago. From the Rogue River Valley I imagine that perishable fruit would reach Roseville as quick as it would reach Portland, but when you get nearer Portland coming north it makes a little difference.

Exam. Rogers. Well, where would this shipment originate that you put on the manifest? Celery, wasn't it? (2974.)

A. Just north of Salem, in Marion County, at Brooks, Oreg.

Mr. Dey. Forty odd miles.

Exam. Rogers. Well then, from that point, we will say Salem! There would be that two or three days difference?

A. There would be a saving in time by handling it from Portland as against going south. If that is not right I would like to have Mr. Mulchay correct it.

Cross-examination:

At the beginning of my testimony, I outlined some of the early history in connection with the movement of western Oregon traffic and stated that when the Southern Pacific and O.-W. R. & N. were under common control, all of the western Oregon traffic moved via (2975) Portland and the O.-W. R. & N. and Union Pacific system lines, principally because of the merger and the fact that those lines were then under one general direction. After the lines were unmerged, the rates and routing were reestablished through
1615 Roseville and Ogden; and in addition to that the rates were established through the Portland gateway with the other lines.

As to whether the predominating routing via Roseville prevailed as distinguished from routing it all through Portland: it changed. The change was more or less gradual until the present condition obtained.

Q. Well, is it not true that during the time when the railroads were under control of the railroad administration, for reasons of economy and efficient operation of the carriers, all of the traffic north of the California line from points on the Southern Pacific was again routed via the Portland gateway (2976) and the Union Pacific system east?

A. Well, I am not competent to answer that from the standpoint of efficiency and economy.

Q. Well, what is the fact as to whether they did that actually during the railroad administration operation of the railroads?

A. During the railroad administration there was more of that traffic moved through the Portland gateway than there has since. I can't say whether it all moved from Southern Pacific points in western Oregon through the Portland gateway, but I know that the movement was heavy. I was in the railroad service at that time and was stationed at Portland as general freight agent of the O.-W. R. & N.

Q. And you don't know what the routing on western Oregon traffic was during the railroad administration period?

A. The shipper controlled the routing on commercial business just the same then as he does now. (2977.)

Q. Do you know what the instructions of the railroad administration were with reference to the routing of unrouted
1616 traffic from western Oregon points on the Southern Pacific?

A. Well, I don't recall that particular feature. I don't believe there was much unrouted traffic. If it was Government traffic it was routed by some officer of the Government during the railroad administration.

Mr. SPENCER. You mean general traffic. The railroad traffic was routed just the same during the railroad administration as at any other time, wasn't it?

A. Yes; that is what I mean. And I mean as to Government traffic, that was not unrouted.

Mr. SPENCER. He didn't ask for Government traffic.

Q. (By Mr. ELLIS.) Then are you saying here that there was no substantial difference in the manner in which the western Oregon traffic originating on Southern Pacific lines moved during the period of Federal control as distinguished from the way it is actually routed or moved to-day?

A. Well, with this exception. I said that during Federal control the movement was much heavier through the Portland gateway, and that had reference to Government business. I think that it is true with any traffic that could be handled through the Portland gateway, that the administration could control that way, was so handled, because of the tremendous movement of traffic to and from California (2978) over the Union Pacific.

There was absolutely no incentive for solicitation and action on the part of local agents in securing routing over the Southern Pacific as distinguished from the situation since during railroad administration. It was all one big railroad.

Exam. ROGERS. Now if that were true, these various elements that you told us about this morning that influence the routing over the Southern Pacific because a mill was located on the Southern Pacific, or the industry, were not there during Federal control, were they?

1617 A. No; they were not there. It was pretty much all left to shippers, because the railroads were not soliciting business and they were handling it to the best advantage of the carriers for the Government.

Exam. ROGERS. What do you suppose the shipper did about the routing in the absence of those elements?

A. Well, as I said, there was a heavier movement through the Portland gateway during that period. I think the lack of solicitation had something to do with that routing. (2979.)

Comr. MCMANAMY. Now have you heard anything about traffic being arbitrarily routed by the railroad administration during Federal control and claims having been made against the Government since that time by the roads from which the traffic was diverted?

A. No; I have not. But of course there is a law now, that if you take freight away from a line over which it is routed the line over which the traffic is routed can make a claim for the revenue. It has been in force for some time.

Comr. MCMANAMY. You don't recall having seen any orders issued by the railroad administration during Federal control to route traffic by a certain more direct and economical line of movement? The order was issued some time ago.

A. Not at this time. If such orders were issued I might have seen them but I don't recall them now.

PORTLAND, OREGON, *20, 1928.*

H. E. LOUNSBURY thereupon resumed the witness stand, and testified further as follows:

Cross-examination—(Contd.)

1618 [The question arose as to the provisions contained in the contract with the Oregon Trunk on the Des Chutes line with reference to extensions of the Des Chutes line beyond Bend and its use by the Oregon-Washington Railroad & Navigation Company. Mr. Ellis asked that a copy of the contract be inserted in the record.] (2981.)

Q. (By Mr. ELLIS.) How did you account for the fact, Mr. Lounsbury, that the traffic moving from western Oregon points through the Portland gateway consists mainly of fruit and other perishable traffic?

A. Well, I didn't say that the traffic moving through the Portland gateway consisted mainly of fruit and other perishable traffic, because the bulk of the movement is lumber, but that which does move that way is routed by the shipper.

I haven't set out any figures in my exhibits showing the amount of that traffic which we receive and the portion of it which is lumber, as distinguished from perishable traffic, but I think the statement I submited would show the comparison. As to what extent our company is active in soliciting traffic from western Oregon, we have two travelling freight agents in western Oregon, one covering the territory north of Eugene, one located at Eugene covering the territory south of Eugene to and including Ashland. We are at this time, and have for the past several years, pursued a policy of active solicitation of traffic in western Oregon. (2982.) In my judgment, we are getting from Southern Pacific points in western Oregon all of the traffic that we can expect to get through active solicitation.

Q. Would you say definitely, Mr. Lounsbury, that the existing basis of divisions between the Union Pacific and the Southern Pacific has not to some extent lessened your desire for that western Oregon traffic to be routed through the Portland gateway?

1619 A. They have not.

Q. Well, is it not true, Mr. Lounsbury, that your divisions through the Portland gateway in connection with Southern Pacific traffic are somewhat unsatisfactory to your company?

A. I can't say that they are. (2983.)

Q. Do your solicitors in western Oregon have any instructions as to the routing to be solicited or advocated in connection with this western Oregon traffic? Are they instructed to get it for routing through the Portland gateway if they can, or just simply to get it routed Union Pacific, either Portland or Ogden?

A. They are soliciting for routing via both the gateways. They are working in cooperation with the agents of the Southern Pacific to the best advantage of either line.

Generally speaking, it is true that the rates on lumber from western Oregon apply with equal advantage through both the Portland and Ogden gateways to all eastern destinations.

Q. What are the principal exceptions, where the Portland gateway carries some arbitrary or additional charge?

A. As far as routing through the Portland gateway and the Union Pacific system lines to eastern points, there is no difference as against routing through the Ogden gateway to all eastern destinations. To Minnesota territory routing is applicable through Ogden and through the Portland gateway Union Pacific to some territory in Minnesota on Northern lines more advantageously than to (2984) other Minnesota territory.

Q. I have heard it said by lumber shippers that they were unable to route via the Portland gateway, I believe, to what they call Minnesota transfer points, by reason of some arbitrary. I am wondering if that is a fact?

1620 A. Now you are speaking about routing in connection with the Union Pacific in that connection, not Northern lines, because there is no arbitrary through Portland gateway and the Northern lines.

Q. But there is via the Portland gateway and the Union Pacific?

Exam. ROGERS. Can you go via Union Pacific, or O. W., and get to Minnesota transfer?

A. Yes; we have rates to Minnesota transfer through Council Bluffs and the Chicago, St. Paul, Minneapolis & Omaha, but I think that what Mr. Ellis refers to is lumber that is being shipped to Minnesota for milling in transit. The door factories in Minnesota and Wisconsin buy considerable lumber in this territory to mill in transit and ship on east, and they can take the lumber from this territory by the northern routes and stop it in transit to be milled at a cent and a half transit charge. To take that lumber through the Council Bluffs gateway and up to Minnesota for milling the transit charge is four and one-half cents. (2985.)

Q. (By Mr. ELLIS.) I believe you testified that there were no Oregon coast mills shipping by water to a rail terminal and thence by rail across the continent. Do you know whether during the past few years there have been mills cooperating on the Oregon coast?

A. The question was with respect to movement through California coast ports. As I said, there were no through rates from Oregon coast mills through the California ports and then east. During the time that the mill was operating at Brookings, I don't recall that there were any arbitraries north of Eureka. I don't know that it is true that the Brookings mill shipped by water to San Francisco and thence by rail east to quite a large extent.

1621 Q. Now, with reference to the matter of the Portland gateway and the traffic handled, you have made some point of

the fact that you are handling less business through the Portland gateway than you did previously, and you quoted a comparison of eight thousand cars against 2,056. Have you any explanation for that marked decrease in the number of cars through Portland, or was that eight thousand figure the one covering the period when (2986) the two lines were under common control?

A. No; that was during the railroad administration period. That is accounted for by the conditions that I explained on Saturday, the arbitrary routing during the railroad administration control.

Q. Discussing the lumber industry, as I recall, you discussed the increase in use of lumber substitutes. Are any of those substitutes being manufactured in Oregon, or are plants being constructed for the manufacture of those products in the State of Oregon?

A. Well, there are some substitutes manufactured in this territory, such as plaster board, but there is nothing like the fibre substitute that I know, any plants in this territory that are in prospect.

Q. Aren't some of the mills, lumber mills, now under construction being equipped to utilize all waste products in the manufacture of substitutes, lumber substitutes, or do you know about that?

A. I don't know just what you have in mind, Mr. Ellis. If it is built-up lumber, why, there are. There are mills or plants in this territory that are taking veneer for the surface and filling the veneered slab with a composition, sawdust, making a board that way. (2987.)

1622 Q. Well, is it not true that the percentage of the substitute material is rather small as compared with the percentage of use of the lumber itself?

A. Well, the substitutes are taking the place of a great deal of common lumber and the purpose for which lumber is used. I don't know what the percentage would be. Those substitutes are being manufactured in the East, principally. A small proportion is made out of built-up lumber. I wouldn't say the substitutes manufactured in the East are mainly made of cane fibre and similar materials; there are wallboards.

Q. You made the statement in connection with the cross-State line and the short hauling of the Southern Pacific that it wasn't conceivable that the Southern Pacific would short haul itself. I am wondering what difference there is in that situation of the Southern Pacific short hauling itself on the western end of the haul on eastbound traffic and the situation which is disclosed in your testimony whereby the Union Pacific is short hauling itself by turning over western Oregon traffic (2988) to the Southern Pacific at Ogden?

A. Well, the Union Pacific connects with the Southern Pacific at Ogden, and if freight is routed via Union Pacific—Southern Pacific and we arbitrarily carry that—and the Union Pacific system lines arbitrarily carry that carload of freight, for example, to the Portland gateway, under the law we would be obliged to give the

Southern Pacific all revenue from Ogden to destination in western Oregon.

Q. Well, is that not the identical situation that exists on the western end—the Southern Pacific would be connecting with you at Crescent, or at Portland and wouldn't they be required to give you the long end of the revenue, as well, if they carried
1623 it through Ogden?

A. You are confusing two different situations. The situation I refer to is the control of the movement or solicitation of the movement before it starts, and what I had reference to by the Southern Pacific short hauling itself, they use every influence they can to secure from the shipper the long haul, and after the shipper routes the traffic it must move the way it is routed.

Q. Then the solution for that problem, or the changing of the routing in any way, would have to come about through some difference in the method of solicitation in western Oregon, if the (2989) cross-State line is to have a proper share of the traffic?

A. I wouldn't say difference in the method of solicitation, because I don't know of any through line that doesn't undertake to secure the long haul on the traffic it originates.

Q. Would you say, or do you know, whether the existing practice in the routing of western Oregon traffic is governed or affected in any way by any agreement between the Southern Pacific and the Union Pacific arising out of the control of the Central Pacific as recently approved by the Interstate Commerce Commission?

A. Not from the Southern Pacific lines.

Q. You are certain that the Southern Pacific Oregon lines are not affected in any manner by any agreement between the carriers concerning the Central Pacific?

A. I think that situation was fully covered by the Interstate Commerce Commission's order in that case. The order only applied as far north as Klamath Falls and Kirk at that time. It only covered the Central Pacific lines. Aside from that, I know of no other arrangement arising out of that same situation that might affect the routing of western Oregon traffic.

1624 Exam. ROGERS. Mr. Lounsbury, routing east via the cross-State line (2990) would, I take it, depend on the establishment of through rates?

A. Yes, sir; and more than that.

Exam. ROGERS. And on the through rates, other than a voluntary establishment or agreement by the Southern Pacific, before they could be forced upon the Southern Pacific consideration would have to be given to section 15, paragraph 4, as to the short haul of the Southern Pacific?

A. I would think so. (2991.)

Q. (By Mr. ELLIS.) I believe in connection with the routing of western Oregon traffic you suggested that the Union Pacific would have nothing to offer to the western Oregon shipper to get the

traffic; wouldn't an advantage in distance of three or four hundred miles under existing conidtions and under circumstances making it important for shippers to reach their market in a short period of time, be an advantage important enough to secure for you a large portion of this traffic?

A. I don't believe it would prove any more so than the past experience with the Portland gateway. The saving in distance from many Willamette Valley points would be greater, but that saving in distance is overcome by other considerations which I pointed out in my direct testimony.

We do get the greater proportion of the broccoli shipments from Roseburg, solely by reason of the saving in distance, through the Portland gateway, but if that distance were to be shortened two or three hundred miles or more, or even one hundred fifty miles, I don't think our proportion of western Oregon traffic would increase substantially. I think that the business would still move through the Portland gateway. (2992.)

1625 As to how far south the Willamette Valley goes: It is just below Cottage Grove. There is a mountain divide between the Cascade and Coast Ranges, down near Leona.

Q. In all of your exhibits, Mr. Lounsbury, have you, or in any of them, in making rate comparisons via the cross-State line route and via other gateways, used any other basis of rates for the cross-State line than a combination of locals, or any other basis of rates via other junctions than a joint through rate basis?

A. I set forth in the introduction of the exhibits where I had used the combination of locals, and where I had used continuous joint mileage. I used combination of locals in most all cases, except where I used the State commission's intrastate continuous-mileage scale on grain, potatoes, onions, hay, and straw. But I was not sure in my own mind whether that scale would apply on a new line which was not in existence at the time the order was made. I showed it there and I used it in some cases. (2993.)

Q. (By Mr. ELLIS.) In connection with your Exhibit 56, showing market prices at San Francisco and at Portland, I was not quite clear as to your conclusion or comment with reference to the difference in prices. Was it substantially this: That although the market prices at San Francisco were most often higher than at Portland, the additional freight rate to reach the San Francisco market more than offsets the difference and, therefore, the producer of livestock could sell at a greater net in the Portland market than he could in San Francisco?

A. Substantially so. I stated there were cases when that condition would exist.

1626 Would that be the situation confronting the livestock producer of southwestern Idaho and eastern Oregon in the event his distance to San Francisco should be reduced several hundred miles?

A. Yes; I don't think his freight rates would be any less than they are now, except from the territory west of Ontario. On the other hand, the same situation with respect to the San Francisco market exists at the north Portland market at certain periods of the year, when the north Portland market is higher than the California market. I can't say that the San Francisco market is higher, as a rule.

At this time I can't say that a difference of 300 or 400 miles in distance would make any difference (2994) whatever in the freight rates on livestock.

Q. But your conclusion with reference to Exhibit 56 was based entirely on the assumption that there would be no difference in the freight rate via the cross-State line, or as against the Portland or the Ogden gateways?

A. Except from the Crane-Burns territory there would be some advantage in freight rates to San Francisco under the present rates.

Q. In your Exhibit 57, showing livestock shipments interchanged with the Southern Pacific Company, I note under the heading "Delivered to S. P. Company," year 1926, under the column "Switch," 365 cars, while under the heading "O. S. L." you have listed only eight cars of all kinds of livestock. Does that mean that only 8 cars of livestock moved from Oregon Short line points to Southern Pacific points during the year 1926?

A. Through the Portland gateway; yes.

Q. Does that mean exactly that no more cars moved through
1627 the Portland gateway, or might some of the movement be included in this 365 cars under the heading "Switch"?

A. Some of the movement might be included, but my opinion is that there is some Short Line movement in that 365 "Switch"; but, if so, they were shipped to the Portland market and sold there and reshipped as a new shipment from (2995) the Portland yards to California or southern Oregon.

Q. As livestock is now handled through the Portland stockyards destined to San Francisco, is it not the usual practice for them to be shipped to Portland and sold and then picked up by buyers from San Francisco and shipped through as a new shipment from Portland to San Francisco?

A. The first part of your question is wrong, in that they would not be billed through to San Francisco and stopped at Portland to be sold. They might be stopped at Portland for feed and rest. But there are buyers from the San Francisco market who frequently buy stock in the Portland yards that is moved in from all the northwest territory and is sold on the market in the Portland yards. When that stock is bought by a San Francisco buyer it is shipped as a new shipment and pays the Portland-San Francisco rate, and would appear in this 365 total under the column "Switch," rather than under the column "O. S. L."

I would say there are undoubtedly some shipments from Idaho in that 365 total that actually did originate on the Oregon Short Line. (2996.)

Q. Referring to your Exhibit 58, showing wheat rates, will you explain why, in making this comparison, you used the destinations of Salem and Eugene on shipments originating at main line
1628 and branch line points of the O.-W. along the Columbia River, and then used the destination Portland when you applied your rates to the cross-State movement.

A. As I recall it, there was some testimony presented to the effect that there would be a heavy movement of wheat from southern Idaho to Portland over the cross-State line, and for that reason I showed this statement as a comparison, notwithstanding the fact that the distance by the main line through Huntington is considerably less. The showing of the wheat rates from The Dalles and east to Salem and to Eugene is entirely a separate statement; it has no relation to the other, and I made that with the idea that the dairymen in the Willamette Valley could and do, or the miller in the valley could and would purchase his wheat in the Columbia River counties and along the O.-W. R. & N., where the distance is shorter than in southern Idaho.

Q. With reference to the movement to Portland, then, if the claim was made that the wheat was to move to Willamette Valley points south of Portland rather than to Portland that latter comparison is of no particular interest or importance?

A. Except that you will find the relative difference in the (2997) rates in another exhibit which I presented. In Exhibit No. 62 you will find the same relative difference on wheat as on hay. If you want to get an idea of the difference in rates, just use the relative difference on the hay.

Q. Now are there not some very practical reasons why western Oregon dairymen would desire or buy the wheat from the irrigated areas of southwestern Idaho and eastern Oregon rather than the wheat raised on the dry areas in along the Snake?

A. I don't understand that the dairymen in western Ore-
1629 gon buy any wheat at all. My understanding is that the wheat that goes into western Oregon is bought by the mills, and that is very small.

As to the claim of the agricultural agents of western Oregon that they desire the wheat and other grains from the irrigated areas of southwestern Idaho and eastern Oregon to use in mill feed: A dairyman using mill feed never inquires to my knowledge what kind of wheat it is made of. He inquires the price of the mill feed and he buys it from the manufacturer and the grower of the wheat does not manufacture the mill feed. The price of mill feed does not depend on where the grain is grown and the type of grain (2998); it depends upon the price the consumer can have it delivered for.

Q. Well, you know they don't use a high grade milling wheat, premium wheat, to feed livestock, don't you, Mr. Lounsbury?

A. If that is correct, then they would not use the southern Idaho wheat. The wheat raised in the irrigation districts of southern Idaho is a soft, white wheat, that is used by eastern mills, and sometimes by mills on the coast, for blending purposes. I can't say whether it is known as premium milling wheat.

In my estimates of revenue to the cross-State line, I did not include any revenue whatever from traffic now moving between Pacific coast points and southwestern Idaho and Oregon Short Line points, either east or westbound.

Q. It was your assumption as a basis for your estimate that all of that traffic now moving would continue to move via the present routes regardless of any saving in distance via the cross-State line?

A. When you say all that traffic, that is a pretty broad question. (2999.)

1630 Q. Well, I mean such traffic as now moves between the points that I mentioned to the coast.

A. I would say that it would continue to move by the present lines. That was the basis of my estimate.

I did not include in that estimate any allowance whatever for possible diversion of western Oregon traffic to transcontinental points. I made allowance only for the limited amount of traffic that might originate on the line and be received at points on the line, both in and outbound. There is no bridge traffic included in my estimate.

Exam. ROGERS. Mr. Lounsbury, I wasn't certain about your answer to a question asked by Mr. Ellis, as to the present division between the Southern Pacific and another line. (3000.)

The WITNESS. He was asking me whether the Union Pacific system lines were dissatisfied with the divisions which the Southern Pacific receives south of Portland; I could not say that we are; that is, so it would tend to detract from the solicitation of that traffic, and I said that is not the case.

Mr. ELLIS. The point I am trying to make is that I think the divisions through the Portland gateway are so small they can't afford to handle it that way and don't want it.

Mr. SPENCER. Do you mean to the O.-W. R. & N.?

Mr. ELLIS. Yes.

Exam. ROGERS. Well, I didn't know what the facts were. I just though maybe that if later it came to a discussion between the Southern Pacific and the U. P. lines as to divisions Mr. Lounsbury might be faced with a statement that they were satisfied. (3001.)

Mr. SPENCER. You don't have any jurisdiction over the making of divisions and don't know whether they would be satisfactory or not; do you?

A. No, sir.

1631 Q. (By Mr. MCCULLOCH.) Mr. Lounsbury, on Exhibit 54, your estimate of traffic and revenue from the cross-State line, one column is headed "Suggested through rate." As I understand

it, the revenues computed on this exhibit are computed in every instance on the basis of full combinations of locals where the movement would be over two or more lines; is that correct?

A. Except as to wheat, barley, oats, and potatoes, I have used the intrastate continuous distance rates for joint hauls. In those instances that would make very much less than the full combination of locals.

Q. Would those exceptions amount to very much in money in your total estimates shown on this exhibit on those particular commodities?

A. If you used the combination on those commodities where the movement is shown to and from Portland, you could increase them by about 40 per cent, I would say off hand. (3002.)

Q. All right. Now in the last column, on sheet one of Exhibit 54, you have shown what you call "Gross revenue, Crane-Crescent Lake line." With the exception, then, of wheat, barley, oats, and potatoes, these gross revenues shown on that column are ascertained by multiplying the tonnage by the local rate per ton that you estimate would be applicable for the haul over the cross-State line; is that correct?

A. Yes; that is true with respect to combination with Crescent Lake, but the method of using full combinations is not altogether true with respect to traffic that I have estimated would move through Crane. I have used some arbitraries in that case instead of locals.

Q. What is the basis of class rates between Portland and points on the line up to Crane and west of Ontario, at the present time? Are the class rates the full basis of combination on

1632 Ontario, or something less than the full basis?

A. Well, my understanding is the class rates at present are based on arbitraries from Ontario to Crane, and arbitraries from Crane to Burns. (3003.) But after October 1st we will have continuous rates from Portland to Crane, class rates. The arbitraries from Crane to Burns will still apply.

Q. Now, those class rates after October 1st to Crane, will they be on the standard mileage basis for the distance? When I say the standard class rate basis, I mean on the basis for that distance of the class rates applying east and south from Portland.

A. Not altogether; no. They will be on the Portland class rate distributive scale, with the mileage of the Oregon eastern branch computed on the basis of one and a half for one.

There are a few commodity rates in effect between Portland and points between Ontario and Crane or Burns at the present time. These commodity rates are less than the full combination of intermediate factors on Ontario.

If the cross-State line were built we would contemplate from Portland via Crescent Lake class rates to points on the cross-State line no lower than the full combination on Crescent Lake from Portland. (3004.) That is what my testimony contemplates.

Q. And if the cross-State line were built your idea would be that the class rates from Portland through Ontario and then west

through Crane and out onto the cross-State line, I suppose, would be on the basis that you say they will be carried on and after October 1st to Crane; that is, the standard distance scale, but with the distance from Ontario west computed at the rate of one and a half miles of constructed mileage for each mile of actual distance.

1633 A. Well, that is the situation now. The combination from Portland on Crescent Lake going east from Crescent Lake in the class rates would reduce the Burns and Crance rates as in effect through Ontario, on account of the shorter distance. But as you go east of Crane just a short distance you would run into equal rates.

The purpose of estimates of tonnage and revenue in my Exhibit 54 was to establish the fact that the local traffic on that line would not, in my judgment (3005), support the line, and that it would be very small. I was very careful in making up this estimate to put in everything in the territory that might be considered tributary to that line. I think, as a matter of illustration, I put an imaginary sawmill on the line and figured the revenue from that after two years, but I know of no one who would put in the mill; and I had a very complete estimate of the livestock on these different projects and computed the turnover about the same as Mr. Teutsch did, to arrive at my carloads. I took into consideration Mr. Emerson's statement about the traffic that would be produced from Alkali Lake; one or two cars a day. I showed what that would amount to.

Q. (By Mr. McCulloch.) Mr. Lounsbury, applying this same method that you have used in estimating tonnage and revenue from this cross-State line to the Rogerson-Wells branch of the Oregon Short Line, you believe a similar result would be reached as shown on this exhibit? (3006.)

Mr. Spencer. Well, I object to that as not cross-examination.

The Witness. I don't know.

Generally speaking I am familiar with the conditions on the main and branch lines of the O.-W. R. & N. system, however, as to the traffic they produce and originate and what is destined to points on these branch lines.

1634 Q. If you took and separated the branch lines of the O.-W. R. & N. from the main system and made computations of traffic and revenue for such branch lines separately considered on the basis you have used in Exhibit No. 54, would you show, or could you show, that any of those branch lines would be profitable and self-sustaining from the traffic originated by them and destined to them, and the revenue computed on that traffic on the basis you have used in Exhibit 54?

A. If I were going to estimate the traffic for a branch line with a main line of the O.-W. R. & N. I would estimate it just the way I did this. (3007.)

As to the existing branch lines of the Oregon-Washington Railroad & Navigation Company, in my judgment, such estimates would

show the traffic on the branch line, and it would show the movement in connection with the system lines, and that is just what I have done with this.

Q. Well, I know, but what result would you reach, in your judgment, if you made such studies for the different branch lines separately?

A. It depends upon the conditions in the territory. Now, in the territory we are discussing there is very little traffic to find, and there is no comparison between this line across the State through the desert and any other branch line we have.

Q. Take any of these branch lines—take the Heppner branch, from Heppner Junction down to Heppner, suppose you treated that as a line independent of the Oregon-Washington Railroad & Navigation Company, considering the traffic that is destined to points on it now and originates on it, and that there were no continuous class or commodity rates, but that the rates to points on that branch
1635 were the full combination of locals on Heppner Junction, and you analyzed the tonnage and revenue on that basis, as you have done it in Exhibit 54, what, in your judgment, would such an analysis show? That that line from Heppner Junction to Heppner, considered separately from the main line, as you have considered the cross-State line (3008), would be a profitable and self-sustaining line of railroad?

A. Well, in the first place, I didn't consider the cross-State line separate from the main line at all. I figured the traffic that would move on and off of the cross-State line through Crane and through Crescent Lake. Now, you can't make any comparison with the Heppner branch, because that route runs through towns and villages in the wheat fields nearly all the way from Arlington (sic) to Heppner. Now, if I were making an estimate for the Heppner branch to-day it would show much difference, because there are resources and traffic there to figure on, but there are very little resources and traffic to figure on the line through central Oregon. Here you are trying to make the point that I treated that as divorced from the main line, but I didn't so treat it.

Q. Well, have you anything more to say in answer to my questions about that particular branch, or any of the branches of the Oregon-Washington Railroad & Navigation Company? My point is this, if you chose to make an estimate of tonnage and revenue on the basis you have used in Exhibit 54 for branch lines of the Oregon-Washington Railroad & Navigation Company, generally, wouldn't it be possible to demonstrate by that method that all of the branch line operations were unprofitable and not self-sustaining?

A. I don't know. I haven't made such an estimate for branch lines. (3009.)

1636 Exam. ROGERS. Mr. Lounsbury, I think the information Mr. McCulloch is attempting to get is this—were you a traffic witness in the case involving the extension of the line from Bend to Burns?

A. Yes, sir.

Exam. ROGERS. I notice that the commission said in that case that the line would not be operated at a profit in and of itself, but as a feeder it would be profitable. I take it that is what Mr. McCulloch had in mind.

Mr. MCCULLOCH. Exactly. That is just exactly what I have in mind. Have you anything to say as to the use of the cross-State line, or of the function of the cross-State line, as a feeder both for the Union Pacific system lines and for the Southern Pacific, with which it will connect on the west? In your judgment, would it have any value whatever as a feeder line to either the Union Pacific system lines or the Southern Pacific lines?

A. I don't think as a feeder line that it would be profitable to the Union Pacific system lines. As to whether it would have any value as a feeder (3009) I don't believe the Union Pacific system lines off of that cross-State line would receive very much more traffic than they now receive from that territory which comes to them at Crane and Burns or Bend.

The Sumpter Valley Railway connects with the Oregon-Washington Railroad & Navigation Company at Baker. The Sumpter has an eighty mile line extending from Prairie City, Grant County, to Baker. The Sumpter Valley Railway is an independent connection of the Union Pacific system lines. It is of value as a feeder to the Union Pacific system lines because it has something to feed to the Union Pacific system.

Q. And yet you don't believe that the cross-State line,
1637 when built, even if considered an independent line, would have any value as a feeder to the Union Pacific system lines?

A. Not enough to offset the additional cost of operating such (3011) a line.

Q. Well, Mr. Lounsbury, suppose the Union Pacific system lines were not compelled to provide the investment to build this cross-State line, but it were built by the Southern Pacific, for example, or independently financed and built, so there was a connection there, under such circumstances would it be your judgment that such a line so in existence would be of no value as a feeder line to the Union Pacific system lines, assuming that the Union Pacific has no investment in that cross-State line?

A. I couldn't say it would be of no value, but I do say that such a line might take away from the Union Pacific more than it delivered to it.

Wool at the present time is all moving to the Pacific coast terminals and thence east by water from all of the territory served by the Oregon-Washington Railroad & Navigation Company lines.

I did not participate in the Boston Wool Trade Association case, docket No. 13272 (3012) involving a proposal of the Boston Wool Trade Association to make rates from all of the intermountain wool producing territory joint rail and water to the terminals and thence through the Panama Canal to Boston.

Mr. McCULLOCH. I have the brief here that was dated May 15, 1925, and it was sometime before that. There was testimony in that case by the traffic manager of the Boston Wool Trade Association giving the movement of wool from points on the Oregon-Washington Railroad & Navigation Company in 1922, which showed that 67 per cent moved via the canal, and the remaining 33 per cent by rail East.

1638 A. Yes; that was before the rates were changed by an order of the Interstate Commerce Commission denying the transcontinental carriers fourth section relief in connection with the eastbound rates. Since that time the movement has practically been almost entirely to Portland and thence by water. I should say not (3013) more than a dozen cars have moved from eastern Oregon direct east.

Q. Does your testimony, Mr. Lounsbury, contemplate the establishment of rates on lumber from the Willamette Valley on the coast group basis via Crane if this cross-State line should be built?

A. Well, if lumber rates were established that would be the basis.

Q. Does your testimony contemplate that such lumber rates would be established via the cross-State line and Crane east on the coast group basis, or are you figuring with respect to the lumber traffic of the Willamette Valley that as to other traffic mentioned in your exhibits and your testimony the rates on lumber from the Willamette Valley via the cross-State line and the Union Pacific east would be a combination of locals?

A. No; if the rates were established that way they would be on the coast basis. I don't know whether or not joint rates on lumber from the Willamette Valley via the cross-State line would be established. My estimate of traffic for the cross-State line excludes any lumber traffic from the Willamette Valley.

I don't know whether the Union Pacific lines object (3014) to the making of joint rates via the cross-State line and Crane on lumber from the Willamette Valley to all eastern destinations.

1639 Exam. ROGERS. Would it depend on the divisions?

A. That would have something to do with it, depend upon what the Southern Pacific might want to do.

Q. (By Mr. McCULLOCH.) Would there be any reason that you could give, Mr. Lounsbury, why, so long as joint rates on lumber on the coast group basis apply from the Willamette Valley via Portland on the Union Pacific system lines east, why they shouldn't be made on the same basis or no higher basis from the Willamette Valley and the cross-State line via Crane and the Union Pacific lines east, either from the standpoint of the Southern Pacific or Union Pacific system lines? Can you suggest any reason for any difference in the two situations in the two routes, and the need or desirability of joint rates on the same basis via both routes if they were in existence by one?

A. Well, I have been assuming in my testimony, and I think, that any movement of lumber via the proposed cross-State line from the Willamette Valley would be under the coast basis of rates established via that route.

Q. In your various exhibits showing revenues and probable rates on cattle and sheep and various products from the territory to be served by the cross-State line, you have used the (3015) basis in most instances of the full combination. Many of those hauls would be pretty well in excess of 500 miles, wouldn't they? That is, to various markets from points of origin on the cross-State line?

A. Going south to San Francisco from the east end would. Not coming to Portland.

1640 Q. And from points in southwestern Idaho using the cross-State line to western Oregon they would be in excess of 500 miles, wouldn't they, getting up into the valley and south?

A. Into the northern part of the valley, yes.

Q. Ordinarily, you don't make rates for a two-line haul on a higher basis than for a single-line haul when you get up into distances like that, do you, Mr. Lounsbury, 500 miles and over?

A. I don't know what 500 miles has to do with it. We make rates usually higher for a 2-line haul than for a one-line haul, but there are a great many different factors that enter into that.

Comr. McManamy. Isn't that true in the odinary (3016) mileage scale of rates—that is, is there not a point somewhere between 300 and 500 miles where there are no arbitraries allowed for a two-line haul?

A. Not in this territory that I know of. As to whether I have checked that with respect to class rate scales put in effect by the commission: We have no scales of that nature operating here that I know of, on class rates.

Mr. McCulloch. Well, Mr. Lounsbury, isn't it a fact that in the State of Oregon there are intrastate joint rates on grain and hay and potatoes between the Oregon-Washington Railroad & Navigation Company and the Southern Pacific lines on the same basis as for single-line hauls, where the destinations are considerably less than 500 miles?

A. I have the tariff here. I will look and see.

Mr. Spencer. It is all a matter of record, isn't it? You know that the commission forced it on us, and they will do it again in this case of they get it submitted.

A. The only continuous distance rates for joint line hauls that we have is this intrastate tariff prescribed by the Public

1641 Service Commission of Oregon applying on potatoes and onions, grain and articles taking grain rates, a separate (3017) tariff on hay and straw. Now, when you get up to 350 miles, single-line is 28 cents, joint-line haul 29½ cents; 400 miles, 30½ cents, single-line, 32 cents joint; 500 miles, 33 cents single-line haul, 33½ cents joint; 600 miles, 35½ cents single-line haul, and 35½ cents joint. From 520 miles to 560 the rates are the same for single line and joint line.

Q. In Exhibit 59 you show a rate of 70½ cents on potatoes to San Francisco from Ontario via Crescent Lake. Would there be any possible route shorter to San Francisco from Ontario than via Crescent Lake if the cross-State line were built?

A. No, sir.

That 70½ cent rate is a combination on Crescent Lake.

Q. Now, what justification is there, in your opinion, for a suggested rate of 70½ cents for 819 miles via the shortest possible route as against rates of 63 cents via Wells for 1,008 miles, and of 80 cents via Portland all rail for 1,153 miles.

A. I just showed what the combination would be in that case.

Q. I know, but I want to know whether you think that if this line were built the rate on potatoes from Ontario to San (3018) Francisco via the cross-State line and Crescent Lake should be 70½ cents?

A. It might be the same as applicable via Wells of 63 cents but you will notice that the rail rate from Portland is 35½ cents, and from Eugene 42 cents, so that as you go south of Portland the rates become higher to San Francisco by rail.

Q. Your use of the combination rates in these exhibits generally leads me to wonder whether that is the basis of rates that you believe ought to be made and established, in the event
1642 this cross-State line is built, for traffic moving to and from points on the cross-State line?

A. That will probably be the way they are made, or will be made. I haven't noticed the Great Northern making any through rates with the Southern Pacific through Klamath Falls.

Q. Now, would you give the same answer, Mr. Lounsbury, assuming that the cross-State line is built and the Union Pacific system lines are required to build it, or to join in its building, would you make the same answer, that the rates after the line was built ought to be the full combination and probably would be made that way?

A. Ending at Crescent Lake? The line being built by the Union Pacific to Crescent Lake.

Q. Yes; or the Union Pacific being compelled to join in the construction of the line?

A. I think most of the local rates will be made on (3019) combination on Crescent Lake.

Some of the rates to and from points on existing branches of the Oregon-Washington Railroad & Navigation Company are made on the basis of the rate factor up to the junction with the main line and then the other rate factor beyond the junction; on the Bend branch many of the rates are made by combination over Sherman.

The Heppner branch, the Condon branch, the Shaniko branch, and the Pilot Rock branch all originate a good deal of wheat. The rates on wheat from points on those branches to Portland are not the combination of the rates to the main line junction plus the rate from the main line junction to Portland, but they are all higher than the

main line junction rate. They are published as through rates, but they were built up by use of arbitraries over the main line
1643 junctions, except that in the intrastate application of the grain rates continuous distance mileage applies from those branches as a single-line haul. With the exception of the Bend branch, we apply continuous distance rates to and from points on (3020) those branch lines, but I don't think that that is comparable with a situation that you are dealing with where we are joining up with the Southern Pacific at Crescent Lake.

The rates on wheat from Bend to Portland are not fully the combination on Sherman, which is the main line junction. They are made in another way. The intrastate rates are through distance rates. The interstate rates are not. The intrastate rates being through distance rates are slightly lower than the full combination on Sherman.

Q. In Exhibit 58, in the second column at the foot of the page, you have shown from Burns to Portland on wheat via Huntington 43 cents. Is that an instance of a rate made on an arbitrary over Crane?

A. Yes; that shows a 5-cent arbitrary there, and that is the way it is made.

Q. And the rate from Crane to Portland of 38 cents, that is less, is it not, than the combination of the local rate on wheat from Crane to Ontario (3021) and of the interstate rate from Ontario to Portland?

A. Yes; that is built up on an arbitrary over Ontario.

The rate on wheat from Crescent Lake to Portland, using the intrastate tariff, would be 22 cents. From Burns to Portland a combination on Crescent Lake of 46½ cents is shown.

Q. Subtracting the 22 cents from 46½ cents would leave 24½ cents as the factor you would use for the haul from Burns to Crescent Lake in this combination?

A. I presume that was the way it was made.

1644 Q. In Exhibit 60, for the year 1926, I understand the Oregon-Washington Railroad & Navigation Company received from the Southern Pacific at east Portland 90 cars of traffic that were destined to local points on the O.-W. lines?

A. Yes, sir.

Q. Some of that traffic may have originated on the Southern Pacific, Salem and south and perhaps Eugene and south. There is nothing to indicate the source of origin of that traffic.

A. The 90 cars constitutes the entire delivery of these (3022) commodities from all points on the Southern Pacific in western Oregon.

Q. (By Mr. McCulloch.) Now, you have no information as to the particular destinations on the Oregon-Washington Railroad & Navigation Company lines to which these 90 cars went, have you?

A. No; I took this off of the interchange. Anything east of Huntington would be considered Oregon Short Line on this statement.

Q. Well, then, so far as these 90 cars, O.-W. local traffic, are concerned, with that explanation none of those 90 cars would likely have moved via Eugene and the cross-State line, even if that line had been built in 1926?

A. No, sir; none of them.

Q. Take the next column. There were seven carloads destined to points on the Oregon Short Line. Is there any reason why those seven carloads, that you know of (3023), if this cross-State line had been built, might not have moved from western Oregon via Eugene and to the points of destination on the Oregon Short Line?

A. There was one carload of walnuts and five of canned
1645 goods. The walnuts may have originated over at Newberg, which would be nearer to Portland than to Eugene. The five cars of canned goods may have originated at Hillsboro, Woodburn, or Salem, which is a shorter distance. I mentioned in my direct testimony that there are canning factories south of Salem in the Willamette Valley.

Q. Where? (3024.)

Exam. ROGERS. It would depend upon where they originated, wouldn't it?

A. Yes, sir.

There were 382 cars in that same year that moved to points on the Union Pacific Railroad. As to whether a considerable portion of these cars, had the cross-State line been built, would have moved over it and have found a shorter route to those destinations: 337 of those cars were the broccoli movement, which I think I testified would continue to move through the Portland gateway, I thought, on account of better through service that way and the better icing facilities than via the cross-State line.

Q. Well, Mr. Buck testified here that his figures of cost of construction contemplated a main trunk line standard of construction in every respect. Is it your idea that the through train service and icing facilities via the cross-State line would be inferior in standard to the standard of construction of the line, or inferior to the service and similar facilities on the line, from Portland, the Columbia River route? (3025.)

A. Well, it is my opinion that there won't be traffic to justify the fast service over that line that now obtains through the Portland gateway.

1646 Q. Now, take this 433 cars that the Oregon-Washington Railroad & Navigation Company in 1926 received from the Southern Pacific at east Portland destined to points east of the Missouri River, isn't it true that if the cross-State line had been built in that year that those 433 cars might have moved from these points of origin in western Oregon over the cross-State line to reach those destinations?

A. The bulk of that movement was broccoli. The balance might have gone the other way, except 43 cars of cherries which moved by express.

Q. Now take the next column, 9 cars to destinations west of the Missouri River—I assume that those would be to destinations reached by the Union Pacific Railroad or its connections?

A. Reached by connections of the Union Pacific west of Missouri River.

Q. Well, as to those nine cars, if the cross-State line had been built in 1926 it might have moved over it; isn't that true?

Exam. ROGERS. Where did they originate?

Mr. MCCULLOCH. All of this traffic originated in western Oregon on the Southern Pacific.

Exam. ROGERS. But where abouts on the Southern Pacific?

Mr. MCCULLOCH. Mr. Lounsbury doesn't know. (3026.)

A. This is all of the movement from all western Oregon, nine cars.

Exam. ROGERS. Well, how can you say how it would have moved without knowing the point where it originated?

1647 Mr. MCCULLOCH. Well, the only point I make, Mr. Examiner, is this, that of these seven cars to the Oregon Short Line points, the 382 to Union Pacific, the 433 to east of the Missouri River, and 9 to the west of the Missouri River, unquestionably there is a substantial number that if this cross-State line had been built could have moved to destination through Eugene and the cross-State line as advantageously from the standpoint of time and distance as via any other route. Don't you believe that is true, Mr. Lounsbury?

A. No. A very small portion. Most of the canned goods—and that constitutes most—broccoli and canned goods and prunes are the principal commodities in that list, and with the exception of broccoli, which I stated would not move that way, I think the canned goods and the prunes originated in the northern Willamette Valley counties to the greatest extent.

Referring to shipments of lumber by water to (3027) Atlantic seaboard from sawmills in Oregon and Washington located on tidewater showing the increase of that movement in recent years. A large part of that movement by water in those years consisted of rough green lumber, but it did include some finished lumber, even doors.

The rail rate per one hundred pounds on lumber from Portland or Seattle to New York City is 90 cents. The prevailing water rate on lumber from Portland or Seattle to New York City is around $14.00 a thousand, converted to a rate per one hundred pounds, on the rough green lumber, figuring three and one-third pounds to the foot, would make a pretty low water rate, something like around forty cents a hundred pounds.

Q. What I am getting at is, Mr. Lounsbury, that this lumber that is moved by water, generally speaking, has moved at (3028)
1648 rates converted into a one-hundred-pound basis, about half or less than half of the rail rate to the same destination.

A. I think that is true.

Exam. ROGERS. Well, the point you made of that Mr. Lounsbury, as I recall it, was that it was in connection with the original condition

existing at the time this line was thought of across the State, at which time there was no water movement.

A. There was no water movement via the canal at that time.

Q. That was the connection in which you mentioned that?

A. I referred to that, yes, to show the tremendous increase in the movement of lumber products from this territory through the canal.

Q. (By Mr. McCULLOCH.) Yes; now, the water rates, are they made on the basis of weight or thousand feet board measure?

A. Thousand feet.

Q. Now, do you know, Mr. Lounsbury, whether there ever was any substantial movement by rail in the past, or is at the present time, of lumber from western Oregon or western Washington to the Atlantic seaboard, rough green?

A. Why, I think so. Before the movement from the coast mills via the canal the mills in western Oregon were not at a disadvantage with other coast mills in the manufacture of green lumber or timbers, ties, and so forth. (3029.) The rough green lumber moved by rail across the country before it was surfaced and dried and a thousand or twelve hundred pounds of weight taken out of it by drying. This is true of railroad material, bridge timbers and ties and in the past there has been a considerable movement of rough green lumber from Oregon and Washington to the Atlantic seaboard. (3030.)

In recent years since the movement of lumber by water through the Panama Canal to the Atlantic seaboard has been in-
1649 creasing so largely, the opportunity to ship by water to mills in the Northwest on tidewater has enabled them to move a considerable volume of the lower grades of lumber by water to the Atlantic seaboard.

I think in the past there has been considerable movement of the lower grades of lumber to the Atlantic seaboard by rail.

Q. Don't you know, Mr. Lounsbury, that from western Oregon for the lower grades of lumber California has been practically the only market they had on account of the relationship of what they could get for the lower grades of lumber in the eastern markets to the cost of getting it there?

A. California was a consuming market, but the California market was limited and the mills sold their lumber wherever they could.

Q. Well, don't you know that the mills in the Willamette Valley particularly have never been able, by rail, to ship their lower grades of lumber even into the Middle West and the Missouri River (3031) and Chicago markets, not to mention the Atlantic seaboard markets, on account of the cost of getting it there as compared with what they could sell it for when they got it there? I am talking about lower grades now.

A. Well, I think that you will find some of the earlier mills that were in the valley that did not have dry kilns were selling some of their lumber in the eastern markets.

I would say that there has been a very substantial falling off or decrease of the percentage of rail shipments from points of origin in Oregon to Atlantic seaboard destinations in recent years.

It is true that the increased movement by water of lumber from Oregon and Washington to Atlantic seaboard destinations has
1650 been from points on tidewater, like Portland, St. Helens on the Columbia River, Westport, Wauna and Astoria, on the Columbia River; ports on Puget Sound, Seattle and Tacoma; points like Aberdeen and Hoquiam on Grays Harbor, in Washington; points like Raymond and South Bend on Willapa Bay in Washington, rather than from interior mills, like those situated in the Willamette Valley but I would add to that that mills located close to those ports, having low local rates to the ports, could enjoy some of that water movement.

As to whether the same class of lumber moves by water and by rail (3032): The ships can carry both and do carry both rough and finished lumber and the mills located on these various waters were shipping lumber by boat as compared with the Willamette Valley mills located only by rail.

Exam. ROGERS. What I was wondering about is, if it takes a month longer to ship by water than by rail, how can this factor of lessened time be of so much importance?

A. Well, I do not believe the time is very essential on the rough lumber movement, but on the finished lumber movement there is some of that even moved from tidewater points by rail.

Comr. MCMANAMY. Now if that is true, Mr. Lounsbury, does not somebody have to absorb about $15.00 a thousand difference between the rail and water rates?

A. I don't think it would run that high, Mr. Commissioner.

Comr. MCMANAMY. I was basing it on the water rate between 40 and 50 cents, and 3½ pounds per foot. (3033.)

1651 A. Well, that is true of the green lumber, but the kiln dried lumber of the fir will more nearly average 2,500 pounds to the thousand.

As to whether kiln dried lumber is shipped to any substantial extent by water: I can't tell you to what extent. I understand they put the kiln dried lumber in between the rough lumber in loading a ship. They even put finished doors in between rough lumber below decks.

Q. (By Mr. MCCULLOUCH.) Mr. Lounsbury, I just wanted to call your attention to the figures on sheet two of Exhibit 53 of Witness Cornwall, in which he shows that from Oregon, for the year 1920, the rail movement was 72 per cent; then he gives it for each year down to 1926, and shows the movement in 1926, 71 per cent by rail. Do his figures in that respect correspond with your understanding of the facts as to the percentage of rail movement of lumber from Oregon, of the total that goes by rail and water?

A. So far as I know, his figures are correct. In my illustration I use the average of the Oregon rail and the percentages of the Oregon

rail and Washington rail show the percentage of increase by water. You will note that the increase by water from Oregon is greater than the rail decrease for that period. (3034.)

I notice that the incease of shipments by water has been very much more marked from the State of Washington than from the State of Oregon.

Q. And the decrease in shipments by rail from Washington has been very much more marked than in Oregon, where it has remained in seven years practically stationary; isn't that true?

A. With fluctuations between '20 and '26, that is substantially true, so far as the rail movement is concerned.

1652 It is the same class of lumber going from Washington and Oregon, west of the Cascades.

Some excerpts from reports of Government investigators of the Alkali Lake deposit, which I read in my testimony discussed some other products than the particular product in regard to which Mr. Emerson testified, I believe. These reports were confined to soda ash, sodium carbonate, and other products, I believe.

Q. Well, as I understood, and I listened to them carefully, they did not discuss the soda ash or sodium carbonate.

Mr. SPENCER. I am sure they did. They speak for (3035) themselves, however.

My testimony was based on the assumption that if the cross-State line were built Williamette Valley lumber shippers would still use the lines now existing for shipment east and not route their lumber via Crane.

Q. Would your opinion be changed in any way as to the possibility of the cross-State line being a practicable project if built, if after it was built the Williamette Valley lumber shippers, instead of routing their lumber either via Portland or via Roseville did consistently route it, or a large part of it, via Crane and the cross-State line, would that change the conclusions that you have had to offer as to he practicability of this cross-State line project?

A. That is a pretty large question.

Q. You mean route all the lumber that way?

A. Yes; or a very substantial part of it.

Exam. ROGERS. I think you said all of the Willamette Valley mills.

Mr. MCCULLOCH. Well, say, Salem and south.

1653 A. I don't think it would.

Exam. ROGERS. Why not, Mr. Lounsbury? (3036.) As I understand, practically eighty per cent of all the western Oregon traffic is lumber; if you are going to get all of it over the cross-State line from Salem south, why wouldn't that change your exhibit?

A. Well, I don't believe, in the first place, you would get all of it from Salem south over the cross-State line, because——

Exam. ROGERS. The assumption, for the purpose of the question, is that it would move that way?

Mr. MCCULLOCH. My assumption was based on testimony given by the witness Magladry in this case.

The WITNESS. Well, I can't figure on the lumber that was contained in his estimate, because he used the capacity of mills, while my figures were based on the actual movement; the total lumber moving from western Oregon via the Portland gateway as shown in Mr. Wiggins' Exhibit 50 was 5,512 cars, via the Ogden gateway, 20,030 cars. In my previous statement, I said that 60 per cent of this lumber originated in the territory of Albany (3037) and north, including the Yaquina branch and the Mill City branch of the Southern Pacific. Now, if 50 per cent of this movement were south of Salem, that would be approximately 12,500 cars, and whether or not that would justify construction of a cross-State line I don't know without giving it some further consideration.

Q. Do you know, Mr. Lounsbury, what considerations there are, if any, that make the use of the Rosevill gateway for lumber from the Willamette Valley destined to eastern points any more desirable now than it was in 1905, or its use was in 1905, at the time the Oregon Eastern Railway was projected and partly built? And when I ask that question I want to keep in mind that you explained that at the time in 1905 when the Oregon Eastern Railway was projected and partly built in subsequent years, all the traffic from west-
1654 ern Oregon had been moving through the Portland gateway; that that gateway had been congested by the movement, and that it was not considered essential to have a new and shorter route to relieve that congestion, and, therefore, this Oregon Eastern Railway was projected and partly built, with no attempt at that time, when the two systems were merged, to use the alternative route east via Roseville. Now I want to know what considerations there are at the present time that make the use of the Roseville route for lumber traffic from western Oregon destined to eastern points more desirable than it was in 1905 and (3038) subsequent years, when the construction of this cross-State line was undertaken.

Mr. SPENCER. Now I object to the submission of a question so involved and all-embracing as that, and particularly because there are assumptions there that are not sustained at all by the record or by any testimony in the case. There is not any testimony in the case that the Portland terminals were congested. There is testimony in there with the anticipated movement from western Washington and the continued movement from western Oregon and that which would be developed with the new construction that was known in western Washington, that then the Portland terminals might become congested. But the evidence shows that the western Oregon business went by another route, western Oregon rails are operated in a different way with a different system and the Washington business has gone by water to the extent of about——

Exam. ROGERS. Mr. McCulloch, in your question do you mean desirable from the viewpoint of the carrier, or desirable from the viewpoint of the shipper?

Mr. MCCULLOCH. Yes; desirable from the standpoint of the carriers involved.

Exam. ROGER. The carrier only?

1655 Comr. MCMANAMY. The question was simply this, as I understand it: What is there at this time that makes the Roseville route more desirable than it was in 1905? (3039.)

Mr. MCCULLOCH. Yes, sir; if any. The use of it from the standpoint of the carriers.

A. I don't know. My recollection is that prior to the merger the western Oregon business was moving through the Roseville and Ogden gateways, and after the merger was dissolved that the business again flowed that way.

Q. (By Mr. MCCULLOCH.) Now could you answer the question from the standpoint of the shipping public, what considerations now make the use of the Roseville gateway for lumber traffic of western Oregon more desirable than the existing route via Portland or the proposed cross-State line route via Crane, if any?

A. I would answer that by saying that a lumber mill located in the valley on the Southern Pacific rails is practically in partnership with the originating line, and that the owner of that mill is going to favor the originating line with the long haul, to a large extent, on his business. I think that also answers the previous question.

Exam. ROGERS. What about these differences between 1905 and now as viewed from the standpoint of the carrier only, relative to the Roseville route and this route? Is not one difference as it is now that the P[illegible]land route gives the Southern Pacific no haul, comparatively speaking, whereas before (3040) it did not make any difference whether it went via Roseville or Portland, it was all in the same pocket?

A. That is true; the originating line being the Southern Pacific, they would naturally desire to take the long haul. That did not exist during the period of the merger.

1656 Redirect examination:

Regarding divisions obtaining between the O.-W. R. & N. or the Union Pacific system and the Southern Pacific, as to the routes over which divisions obtain between the Southern Pacific and the Union Pacific system lines: Through the Ogden gateway, the Wells gateway and the Portland gateway.

These divisions are determined by the chief traffic officers in Omaha and San Francisco subject to review and approval by the chief executives of the roads. I have nothing to do with that. (3041.) I have nothing to say about what the divisions will be.

Q. Is it your function as general freight agent to say whether traffic divisions are satisfactorry, or what they should be? Or do you desire to be understood as trying to say so here?

A. No, sir; I have no jurisdiction over the division.

Q. Now do you know whether the traffic through the Portland gateway is rejected by the O.-W. R. & N., or not desired by the O.-W. R. & N., because of the large divisions enjoyed by the Southern Pacific in that traffic originating in western Oregon?

A. Absolutely not.

I am an official of the O.-W. R. & N.; not of the Oregon Short Line or the Union Pacific. I have been in the traffic service for upwards of thirty years.

I have never tried to turn back any traffic that I could get anywhere. (3042.) In my opinion the divisions through the Portland gateway have no influence on the action of the shippers in failing to give the O.-W. R. & N. that business through the gateway. And we are just as active in handling and endeavoring to secure the traffic and get all we can through the Portland gateway.

Comr. McMANAMY. As a matter of fact, as part of the traffic organization you don't consider divisions when you are attempting to get traffic over your line, do you?

1657 A. No, sir.

Comr. McMANAMY. If somebody else has said the divisions are satisfactory, that is sufficient for you—you try to get the traffic?

A. We are charged with the responsibility in getting all the traffic we can.

Exam. ROGERS. And do you, as a traffic man, know whether the divisions that you are getting are compensatory or not, when you are trying to get the traffic to move under a given rate?

A. The assumption is that when a given rate is made, that the divisions are satisfactory, and our business is to secure the business (3043) wherever we can. We can handle all the business that we can get. By assumption, I mean the assumption by the traffic officers that are soliciting the business.

I am a traffic officer and in charge of traffic solicitors.

In answering the examiner's question, I did not undertake to determine, or analyze, or ascertain when rates are in existence and tariff provisions obtain, whether the divisions or rates are profitable, from an operating standpoint.

Exam. ROGERS. Mr. Lounsbury, in answer to a question by Mr. McCulloch you said that if 12,000 cars of this lumber would go via the cross-State line——

A. I said it would approximate 12,500 cars.

Exam. ROGERS. You also said you would have to figure on (3044) that to see whether that would change your conclusion as to the cross-State line.

A. I haven't made any calculation on what that would mean, other than about 33 cars a day of 300 days in the year. I did not take that revenue into consideration, and even if I did I doubt if it would be sufficient to sustain that line.

Exam. ROGERS. Well, if ten cars off the Burns branch a day justified that 30 miles as a feeder proposition, why wouldn't the 30 cars a day off of this line as a feeded proposition justify it?

1658 A. Well, the 10 cars a day was not all the traffic involved in the extension of the line from Crane to Burns. I think I figured on the operation of a 250,000 foot mill a day and at 25,000 feet to the car, 300 days' operation would figure 10 cars.

As to whether a mill runs like that; it would not start in the first year to give us that entire output, but eventually it would get up to that after it had gotten storage in the yards, and so forth.

Exam. ROGERS. Of course all of this is assuming you are going to get the 12,000 cars; that is the assumption, of course.

A. Well, that is just a hypothetical question, because I don't know of any consideration under which that 12,000 cars could (3045) be obtained for that route.

Exam. ROGERS. I know, but I was just thinking about your answer to the question, when you said you would have to figure on it. My point is whether you would have to figure very long or not, if you knew you were going to get the 12,000 cars.

A. I could not settle that question myself. It would have to be considered by others as well as me.

R. WIPPRECHT was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am auditor of the Oregon Short Line Railroad Company, which operates the so-called Burns-Ontario branch extending from Ontario, on the (4046) Oregon Short Line, into Burns, for the account of the Oregon-Washington Railroad & Navigation Company, and has operated it during its entire operating history.

1659 I have an exhibit, taken from the records of the Oregon Short Line Railroad Company as the operating company, reflecting the gross operating revenue and operating expenses, and so forth, reflecting the operations of this Oregon eastern branch for the years 1925, 1926, and 1927.

My position with the Short Line is auditor of disbursements.

The above-mentioned exhibit is comprised of five sheets. Sheet one shows, opposite item 23, a red net railway operating income, or deficit for the three years covered of more than $200,000 for each year (3047). The word "red" opposite item 23 shows a deficit; in the other items it enters into the calculation of the income and denotes debits.

Q. Now do you know whether during that period of 1925 to 1927, inclusive, there was more than the ordinary business enjoyed by that railroad as compared with its operation in previous years?

A. There was some unusual freight business enjoyed, as shown by the footnote on the first sheet of the statement, due to construction of the line to Burns and beyond Burns by the Fred Herrick Lumber Company.

The line from Crane to Burns was opened December 24, 1924.

Q. Now in arriving at this, you had to apportion the revenues, I assume, largely to this branch freight revenue?

A. We have credited the branch with all the revenue that accrued on it, on freight business and passenger business, and where the revenue accrued in conjunction with a main line, or some other haul, it was necessary to apportion it to give the line its proportion of such

earnings. We apportioned the local traffic on a mileage basis, giving the Crane line a constructive mileage of 1¼ miles for each mile of its service as compared to a straight mile on the main line;
1660 and in doing this we allowed a minimum of 25 per cent to the line performing the short haul with the local rates as the maximum. There were some exceptions to this, but that was the general formula. I might say there that the intention in apportioning the revenue was to give the Crane line a liberal revenue on the same basis as though it were an independent line. I think this is a liberal allowance for a branch line.

Comr. McManamy. How does that compare with the divisions which probably would obtain if it was a separate line?

A. This formula was taken, or rather was given us by our traffic people and was taken from an arrangement of that kind that is now already in effect. It is an O.-W. arrangement. I don't recall the line but it was furnished by the O.-W. traffic people.

[Mr. Spencer believes it is the division allowed the Oregon Trunk on the operation in connection with the S. P. & S.] (3049.)

(The statement just discussed was received in evidence, marked "Defendants' Exhibit No. 64, Witness Wipprecht.")

I have a statement showing the cars and tons for carload freight segregated by commodities, the tons for less than carload freight forwarded from and received on the stations of the Oregon eastern and Brogan branches. It was prepared by my department from the books of the Oregon Short Line Railroad Company.

(The statement was offered and received in evidence, marked "Defendants' Exhibit No. 65, Witness Wipprecht.") (3050.)

I have a statement showing the number of cars and tons of commercial freight by commodities for carload traffic and less
1661 than carload traffic, by destinations, on the traffic originating at California points and delivered to the Oregon Short Line at Wells, Nev., during the period February 15, 1926, to December 31, 1926; also similar traffic for the year 1927.

(Said statement was offered and received in evidence marked "Defendants' Exhibit No. 66, Witness Wipprecht.")

This statement shows the commodity, destination and origin.

I have also a statement showing the cars and tons of commercial freight by commodities originating on the Oregon Short Line Railroad, exclusive of the station Armco, Idaho, to Wells, Nev., and destined to points beyond Wells, Nev., segregated as to traffic destined to California points and to all (3051) other points, that is traffic going through the Wells gateway.

(Said statement was offered and received in evidence marked "Defendants' Exhibit No. 67, Witness Wipprecht.")

Armco is the first station south of Rogerson, something like 20 miles south of Rogerson.

Here also is a statement showing the number of cars and tons of commercial freight by carload and tons of less than carload originating on the Oregon Short Line, exclusive of the Rogerson-Wells

Line, and destined to points on the Rogerson-Wells Line, that is from Rogerson, Idaho, to Wells, Nev., inclusive, during the period February 15, 1926, to December 31, 1927.

The purpose of the last three exhibits was to show the business local to the line and the business that goes through the Wells gateway to California, and from California points through the Wells gateway to southern Idaho points; and we will amplify it further by going into the western Idaho country so that it is all seggregated there.

1662 (Said statement was offered and received in evidence marked "Defendants' Exhibit No. 68, Witness Wipprecht.")

Mr. SPENCER. And of course we will contend in this connection that there is a comparison between this line and the proposed cross-State line, and that this line proceeds from a very much larger immediate irrigated producing territory than the proposed cross-State line.

There is an error in Exhibit 68. It reads February 15, 1926, to December 3, 1926. This should read December 31, 1926.

I have prepared another statement purporting to show (3053) the cars and tonnage of commercial freight by commodities, and the less than carload business originating at points on the Oregon Short Line Railroad from Rogerson, Idaho, to Wells, Nevada, inclusive, segregated as to traffic destined to points on the Rogerson-Wells line, and to points in California, and to all other points, separated.

(This statement was offered and received in evidence, marked "Defendants' Exhibit No. 69, Witness Wipprecht.")

Here is a statement purporting to show the mileage and cost of road and equipment of the road from Rogerson, Idaho, to Wells, Nev., with detail sheets attached.

(This statement was offered and received in evidence marked "Defendants' Exhibit No. 70, Witness Wipprecht.")

The total cost as indicated by (3054) this exhibit as of December 31, 1927, is $3,434,322.78, from Rogerson, Idaho, to Wells, Nev. The mileage is 94.11 miles.

Here also is a statement showing the investment in road and equipment, leased lines, material and supplies, and the operating results of the Oregon Short Line Railroad Company for the years 1924 to 1927, inclusive, but stated separately by years.

1663 (Said statement was offered and received in evidence, marked "Defendants' Exhibit No. 71, Witness Wipprecht.")

These exhibits are all based (3055) on past performance and taken from existing records showing just exactly what happened. They are not estimates or forecasts of any kind.

The Rogerson-Wells line was opened for operation February 15, 1926. (3056.)

Exhibit 70, the Rogerson-Wells income exhibit, was compiled in the same manner as explained for Exhibit 64, in that the line was allowed all local revenues and revenues moving onto and off of the line were pro rated, giving the Rogerson-Wells line a constructive mileage of one and one-quarter to every mile. Thus operated, the

deficit for each year for the portion of 1926 during which the line was operated was $44,361.06; for the year 1927, it was $40,816.14.

I have been in the auditor's office of the Oregon Short Line since February 6, 1918.

Investment account 701 of item 1 of Exhibit 71 merely includes our book investment of our investment in road and equipment as shown by the general books.

As to the commission's valuation of the Short Line (3057) I haven't the valuation figure, but as of the date of valuation June 30, 1916, the commission's original cost was something like $18,000,000 less than our book figure as of that date, I believe. Our valuation engineer claimed that our own value as of that date was something like eighteen or twenty million dollars more than the book figure as of the same date and, of course, since June 30, 1916; the charges that have been added to it since that date represent the actual charges as per valuation order No. 3, second revised issue.

1664 We have outstanding stocks and bonds but not in this account. They are outstanding as liabilities on our general balance sheet. There is nothing but operating property involved in Exhibit 71. (3058.)

Cross-examination:

It is my understanding that the Rogerson-Wells branch, the investment of which is shown on Exhibit 70, is not of standard main-line construction.

The exhibits show traffic in carloads and less than carloads, for example, No. 65, the first item in 1925, forwarded, 60 cars, 2,124 tons—that means that the commodities loaded in the 60 cars weighed 2,124 tons. The tonnage was shown in addition to the cars to obtain a comparable figure with the l. c. l. merchandise, which is added in tons only at the foot of each exhibit, I believe. The only place you would look for l. c. l. traffic is opposite the item "Merchandise."

Exhibits 64 and 70 are similarly compiled.

As to the practice of the Oregon Short Line in its auditing department of keeping its accounts and records in the form of Exhibits 64 and 70 for the operations of the various branch lines (3059): The financial statements are maintained in this form for the line as a whole, but not for any individual branch line. Exhibits Nos. 64 and 70 are the results of special studies which it was necessary to make to obtain these figures.

Exhibits 64 and 70 for the Oregon eastern branch and for the Rogerson-Wells branch, separately considered, show that as to revenues and expenses those branches are not self-sustaining.

1665 We have made similar studies to Exhibits 64 and 70 on other lines, but not so complete. We made a previous test on this Rogerson-Wells line, but on the lines and branches which have traffic, the cost of handling that traffic has shown that they could not possibly be self-sustaining. I refer to studies made in July, 1927, on our Ketchum branch, extending north from the main line

as Shoshone, Idaho, and also on the Oregon Short Line Homedale branch. (3060.) These studies were made in connection with the Utah class rates case. We have another branch-line study—exhibits ordered in connection with the Homestead branch. (3061.)

R. W. PICKARD was thereupon produced as a witness on behalf of defendants, and, having been first duly sworn, testified as follows:

Direct examination:

Mr. HART. In explanation I wish to say that "we," meaning the Great Northern, Northern Pacific, Spokane, Portland & Seattle Railway, Oregon Trunk and Oregon Electric, are a little in the dark as to our position in this case. We have been made defendants, but, as I understand it, no testimony thus far has suggested that any of these lines should be ordered by the commission to participate in the construction of this cross-State railroad. On the assumption that the joinder of these defendants contemplates something of that kind, we are offering testimony to show lack of public convenience and necessity for such construction by any of these companies, as well as in opposition to the construction of any cross-State line in that it will injuriously affect some of these companies I name.

1666 Exam. ROGERS. Well, the commission would not be found in any way by the suggestion made by witnesses as to what carriers would be required to construct any such line.

Mr. HART. I assume the commission is bound by the record and if there is no record made of any public (3062) conveniences or necessity contemplating extensions of the lines I represent I suppose there would be no basis for any order.

Exam. ROGERS. That is probably true, but the fact the witness had the Union Pacific in mind wouldn't be any reason why the commission should not determine that the Great Northern might as well do it as anybody.

Mr. HART. I assume that the commission could hardly enter an order requiring the Great Northern to extend its lines when there is no testimony requiring the extension.

Mr. SPENCER. The Great Northern is nearer the territory than the Union Pacific. We don't want to be out there alone.

Mr. DEY. They are nearer to it than the Southern Pacific.

Mr. HART. I am as much in the dark as anybody as to what it has to do with the Great Northern.

Mr. ELLIS. If I recall Commissioner Bean's testimony, it was that the Great Northern should join with the others, in his opinion.

My name is R. W. Pickard and I am general freight agent of the Spokane, Portland & Seattle Railway Company; I also hold the same position with the Oregon Trunk Railway and the Oregon Electric Railway Company.

The capital stock of the Spokane, Portland & Seattle Railway Company is owned in equal parts by the Great Northern and Northern Pacific. The Oregon Trunk and Oregon Electric are subsidiaries

of the Spokane, Portland & Seattle Company and controlled entirely by the Spokane, Portland & Seattle, except the Oregon
1667 Electric there are some few shares of preferred stock in the hands of the public and some bonds, small in comparison with the total.

Describing the lines in Oregon of these companies (3064), commencing with the main line of the Spokane, Portland & Seattle, it runs westerly from Spokane to Portland a distance of 377 miles, with one branch line extending from Lyle, approximately 85 miles east of Portland, to Goldendale, the branch line distance being 42 miles. The branch of the Oregon Trunk extends from Wishram southerly, Wishram being located 106 miles east of Portland on the main line (3065) on the north bank of the Columbia River in the State of Washington. The Oregon Trunk commences there and extends southerly to Bend, a distance of 152 miles, a part of our line and part jointly operated with the Union Pacific. The Spokane, Portland & Seattle has a line west from Portland to the Pacific Ocean, approximately 122 miles, with a branch line from a point called Warrenton to Fort Stevens.

The Oregon Electric Railway runs south from Portland, its main line, a distance of 122 miles, with short branches to Woodburn, Corvallis, and Forest Grove.

The Klamath extensions of the Great Northern, recently completed, owned and operated by the Great Northern Railway, is from Bend to Chemult, with joint use over the Southern Pacific Cascade line from Chemult into Klamath Falls. The Great Northern's investment in this extension from Bend to Chemult (3066) is approximately three million, two thousand odd dollars. The purpose of the Klamath extension as disclosed in the hearings before the commission seeking permission to build the line was the Klamath Basin and the large pine lumber tonnage that will originate in that territory.

1668 The above referred to hearing disclosed testimony which indicated that the production of pine lumber in the Klamath territory would increase substantially by reason of the construction of the Weyerhaeuser mill.

Outlining the territory in the central part of Oregon east of the Cascade Mountains which is served by the Oregon Trunk and by this Klamath extension of the Great Northern: Starting south from Wishram up the Deschutes River Canyon there is a very little production of agriculture or any other traffic to speak of until you get out of the canyon about 90 to 100 miles south of Wishram. There you run into the wheat producing country on arid lands, and continuing on to Redmond, where you first meet up with the agricultural production on the irrigation project. (3067.) Redmond is 18 miles west of Prineville. The Oregon Trunk and Union Pacific lines are connected with Prineville by a municipally owned railroad. The country near Prineville and around Bend is a stock country. Most of their production of agricultural products is in the

nature of alfalfa hay, which is used for stock-feeding purposes. Other diversified agricultural products find their principal markets in the city of Bend and city of Redmond. Continuing south from Bend on the Great Northern line to Chemult you cover about the same character of country, except for the timber that lies on the slopes of the adjoining mountains. Directly tributary to the line between Bend and Chemult there is very little development, and very little traffic, except that that is likewise a stock-raising and feeding country, and that will attract some livestock traffic to that line.

Going south from Chemult there are large stands of timber which will make lumbering the principal industry in that (3068) region.

1669 The Oregon Electric line running south from Portland traverses a country which is well developed, passes through a number of the important cities as far south as Eugene; virtually parallels the Southern Pacific the entire distance. The traffic that it is in a position to obtain, is largely fruit, the products of canneries, hops, some vegetables, but very little lumber, because it doesn't reach the lumber producing areas.

Referring to the territory east of the Cascade Mountains, to what extent the Oregon Trunk is at the present time dependent upon the lumber traffic which it secures from the two pine lumber mills at Bend; in discussing it before I didn't mention the large production of lumber at Bend, but that is so well known that perhaps it isn't important. More than 90 per cent of the traffic of the Oregon Trunk consists of lumber. It is almost entirely dependent, therefore, upon the lumber traffic for its revenue.

Q. Mr. Pickard, assuming that this case contemplates an extension of the Oregon Trunk easterly, what can you say as to whether or not the Oregon Trunk territory is now sufficiently served, or whether there is a present public convenience or necessity for any extension of the Oregon Trunk line easterly from Bend? (3069.)

A. In my opinion, there is no necessity for an extension of the Oregon Tunk east. The large forest reserves in the Ochoco National Forest are available to transportation through the City of Prineville Railway, a municipally owned railway that extends from Prineville Junction to Prineville, a distance of 18 miles.

From Bend the timber that the mills located at that point will utilize comes largely from the territory south.

1670 The country in a line due east from Bend is practically nonproductive, except that it is used for the grazing of stock, and there would seem to be little necessity for added transportation facilities.

There is nothing, in my estimation, in the territory east of Bend to-day for 50 to 75 miles which would justify the construction of an extension by the Oregon Trunk easterly, and I have been over the territory.

Q. Now, applying the same thought to the Great Northern line which runs from Bend to Chemult, assuming this case contemplates

a possible extension of the Great Northern easterly from some point on this Bend-Chemult line, what is there in that territory which might justify the construction of a railroad?

A. Well, the territory lying east of Chemult is a timbered area, and, as well, you have the marshes and the valleys that are used for stock raising. There is some production of grain in the (3070) Fort Rock territory, limited, I think, in volume. Other than that, there are no resources there that, to my mind, would warrant the Great Northern extending into that territory.

I think both the Oregon Trunk and the Great Northern adequately serve the territory they have entered.

I am in a position to know something of the amount of traffic that is being handled on the new Great Northern extension from Klamath Falls to Bend.

The Weyerhaeuser mill, recently referred to, is not yet in operation.

As to the amount of traffic handled over the Great Northern extension to-day; it was opened for operation so recently that
1671 perhaps there hasn't been sufficient passage of time to form an opinion as to what the line will ultimately do, but I have one figure here indicating the entire gross revenue of the Great Northern system on business originating or terminating on the line south of Bend from May 8th, when it was opened for operation, to May 31st, 1928, the last figu that was available at the time it was requested, was only $44,124. (3071.) That's the total earnings for the Great Northern system for the period May 8 to 31st, 1928. As to what we expected for the first 23 days of operation, we were not called upon to make such a prediction. In the usual form we were required to estimate the probable earnings for the first five years. It hasn't gone far enough so that there is much significance to the showing. That, in connection with the fact that the Weyerhaeuser mill at Klamath Falls is not completed and in operation, would mean that these figures are a poor indication, perhaps, of what may result in the way of traffic. The small amount of traffic received is offered by way of explanation. (3072.)

Q. And to indicate that the extension needs all the traffic that it can secure, and no possible traffic should be diverted to any cross-State line?

Mr. SPENCER. You mean in the Fort Rock country?

Q. Assuming that this case contemplates the construction of a cross-State line from Crane to Crescent, or from Crane to Bend, by the Union Pacific or by some other company, what effect would that have on the Oregon Trunk operation and upon the Great Northern Klamath operation?

1672 A. Well, it might divert traffic in northern Klamath County from the lines of the Southern Pacific and Great Northern in northern Klamath County that it was fully expected would accrue to those lines at the time the investment was made in their construction. I am not entirely clear as to what diversion

of Bend traffic is contemplated as the result of construction of the proposed cross-State line.

As to what diversion I would expect of Bend traffic (3073): We wouldn't expect any of the traffic that the Spokane, Portland & Seattle and the Oregon Trunk haul out of Bend to be diverted. We certainly wouldn't wish to see any of it diverted to the proposed cross-State line if it were built via Bend. I understand that the Newell proposal contemplates some of the Union Pacific traffic which they haul out of Bend being diverted to the cross-State line.

Q. (By Mr. ROGERS.) That is, the Newell study offers as one reason for the construction of the cross-State line the saving that would be made on Bend lumber traffic. Let me ask you whether or not you think there is any public necessity for routing the Bend traffic east on the cross-State line instead of turning it over its present route via the Columbia River.

A. There is no need for it, so far as I know, and so far as can be determined by constant contact with the people who are utilizing the present route, either Union Pacific or Oregon Trunk, from Bend to the Columbia River and thence east. And the same holds true with respect to Klamath Falls lumber moving north through Bend to the Columbia River and thence east over the Great Northern.

I think the saving in mileage is an unimportant factor in
1673 connection with (3074) the lumber traffic, except perhaps in isolated cases of special orders, or something of that kind, but taking by and large in the lumber traffic a difference of one or two or three hundred miles in a total haul of fifteen hundred to two thousand miles would be relatively unimportant.

Q. Now, assuming that the cross-State line would result in bringing into the Willamette Valley another contender for traffic, either by way of common user, or such rate divisions, or in some other way: What effect would that condition have upon the Oregon Electric and the Spokane, Portland & Seattle?

A. Well, the Oregon Electric, as I will show a little later with an exhibit, has never earned anything like a fair return on its investment, and any diversion of traffic from that line would only make that showing relatively worse. Certainly the Oregon Electric would exert every effort to prevent the diversion of any traffic that it is now getting. The suggestion made here very clearly contemplates the diversion of western Oregon traffic originating on the Southern Pacific lines to the cross-State line route, and in that situation the adverse effect on the Spokane, Portland & Seattle would be simply because of the large volume of traffic that is delivered to the Spokane, Portland & Seattle at Portland by the Southern Pacific for eastern movement. The Spokane, Portland & Pacific gets such traffic as the Oregon Electric originates between Portland and Eugene (3075), and also gets a substantial volume of tonnage from the Southern Pacific.

I claim that the Oregon Electric is actively soliciting freight traffic between Portland and Eugene at all times, regardless of the effect on the Southern Pacific.

The Southern Pacific was down the Willamette Valley before the Oregon Electric.

1674 Mr. DEY. Forty years earlier.

The Oregon Electric has now before the commission an application for permission to build an extension easterly from Albany into the timber on the westerly slopes of the Cascade Mountain. As to what happened when the Oregon Electric went down there, whether they took the traffic away from the Southern Pacific or did some developing of their own: That leads into a little history about the Oregon Electric construction. It was first constructed by private parties to Salem only, and with a branch to Forest Grove, as (3076) essentially a passenger-carrying line. This was prior to automobile development. In 1911 its owners extended it from Salem to Eugene, a distance of about 72 miles. While it was always a standard railway in every respect, it hadn't been a large factor in handling freight traffic up to the time it reached out its line from Salem to Eugene. Its freight business has shown some growth continuously, but with the advent of the automobile and construction of hard surface highways its passenger revenues have very appreciably declined.

As to where they got their freight traffic business: I wouldn't say that it was any particular development due to the construction and operation of the Oregon Electric, because it virtually parallels the Southern Pacific all the way down the valley, and it took traffic that was there, of course, that the Southern Pacific was handling before the Oregon Electric entered that territory. (3077.)

Q. (By Mr. HART.) Mr. Pickard, a witness has testified this morning to the effect that Cottage Grove, just south of Cottage Grove, marked the southern end of the Willamette Valley. Cottage Grove is a short distance south of Eugene, is it not?

A. About twenty miles, I think.

1675 So the Oregon Electric practically traverses the entire Willamette Valley.

Q. Now then, from Eugene to eastern destinations, such as Chicago, a cross-State line presumably would cut off perhaps 100 to 125 miles of the distance via the routes through Portland?

A. I have made no calculations as to those in respect to mileages, but I should think it would be some shorter. Perhaps that is right.

Taking the extreme southern end of the Willamette Valley, a cross-State line would have the advantage of a saving of mileage approximately to that extent, I believe. Normally, of course, the advantage (3078) would lessen as you would near Portland.

Q. Now can you think of any advantage, aside from this shortened distance, if that be an advantage, which a cross-State line reaching the Willamette Valley would have to shippers? That is, would their present situation be improved by another railroad coming via this cross-State route?

A. That would depend, in so far as the shipper was concerned, the value of the service to him, on the schedules that might be maintained over the two routes. Not always the short route based on distance gives the most satisfactory service to the shipper. It depends upon traffic conditions existing on both routes. Distance is only a factor to the extent that it would affect or bring about better service.

Q. Applying that premise to the lumber traffic, and having in mind that the entire Willamette Valley is traversed by the Oregon Electric as well as the Southern Pacific, what substantial change or advantageous change could be effected by the cross-State line, even as to shippers at Eugene?

A. I can't see that there would be any—and this seems to be
1676 a natural assumption—that the lines operating through Portland and east would naturally readjust their service, if readjustments were necessary to meet the service via the competing route.

I think a difference of 100 or 150 miles (3079) between routes on a haul of 1,800 miles is inconsequential. I think it is entirely unimportant in the lumber business.

Mr. HART. I should like to offer in evidence the annual statements for the last seven years of the Oregon Trunk, the S. P. & S., and the Oregon Electric Railway Company. I have not asked an accounting witness to come for that purpose, but can have one if it is desired. They are the same statements which were used as exhibits recently in the Docket 17000 hearing held here in Portland.

The WITNESS. They bear that heading, which should be disregarded here, and the docket number in this substituted, perhaps.

(The three statements were offered and received in evidence, marked "Defendants' Exhibit No. 72, Witness Pickard.")

These statements, as the titles indicate, show the net railway operating income and return on investment (3080) for the years 1921–1927, inclusive, for the S. P. & S., the Oregon Trunk and the Oregon Electric and the extent to which those lines earn or fail to earn a return of five and three-quarters per cent. Generally, in recent years, the Oregon Electric has operated at an operating loss.

As to what valuation we base our return: Book value, as to the Oregon Electric. With the S. P. & S., and the Oregon Trunk, they have both been valued by the commission. I think there is a slight difference in the figures. It has not been finally adjusted through the valuation department of the commission. There are no substantial differences, as I recall it, between those figures of the book
1677 value of the S. P. & S. and the tentative value that is fixed on it by the Interstate Commerce Commission.

The tentative valuations fixed by the commission on the S. P. & S. and the Oregon Trunk are not far from (3081) the investment figures.

Comr. MCMANAMY. Are they higher or lower?

Mr. HART. Slightly lower.

The WITNESS. I think I can tell you about the S. P. & S. from memory. The book value as shown here in the statement is approximately sixty-four million some three hundred fifty-six thousand dollars. As I recall it, the tentative valuation fixed by the commission was approximately two million dollars less than that.

I don't recall the figures regarding the Oregon Trunk but they were very close to the actual book figure.

Q. So that the net result, if the commission's tentative valuation was used, of these exhibits would not be much different from what is shown here?

A. They would not be materially different.

Q. (By Mr. DEY.) The $3,002,000 you say invested by the Great Northern (3082) extension from Bend south, did that include the purchase price of the logging railroad, or the 75 per cent interest in it?

A. You mean the Shevlin-Hixon line? Yes. I understand the Great Northern purchased a three-fourths interest in that Shevlin-Hixon line. I am not certain it is a three-fourths interest.

Q. That $3,002,000 carried you down to Chemult?

A. Yes, sir. But not beyond there.

Q. It does not include your investment at Klamath Falls?

A. I think likely, Mr. Dey, the figures are not separated here, but they came from the comptroller of the Great Northern. I could not answer definitely.

1678 Cross-examination:

I am not very well qualified to say whether the Great Northern's line south from Bend to Chemult is built according to the same physical standards as the Southern Pacific's Cascade line, but I should say it is not as good a line. (3083.) The distance from Bend to Chemult is 71 miles. I don't think any other road than the Great Northern has the right to use the line from Bend to Chemult.

Describing the traffic of the Oregon Electric and mentioning fruit as a principal item of traffic, it is largely dried fruit and the canned product. It handles very little green fruit. There have been attempts to ship prunes fresh from Salem but they have never been successful and have never had a substantial movement. I don't recall that the Oregon Electric has handled more than a few cars of apples.

As to the lumber traffic of the Oregon Electric, in 1927 it originated 251 cars. (3084.)

As to whether the Oregon Electric serves the Willamette Valley or western Oregon in a comparable manner with the Southern Pacific, I think not, but it compares favorably with the Southern Pacific's east side main line. It does not have the branch line mileage that the Southern Pacific has and it is serving the territory much more completely. That is particularly true with respect to the lumber traffic of western Oregon. I said that the Oregon Electric partici-

pated only to a small extent in the lumber traffic, because it does not reach the timbered sections of the lumber producing points.

I have made no detailed traffic survey of the country between Crane and Crescent Lake, generally speaking, along the route of the proposed cross-State line, as to the possibilities of traffic to be originated there or the possibilities of the country as a pro-
1679 ducer of revenue tonnage for a railroad, if that line were built, but I went over the territory pretty thoroughly and know pretty well what the character of the country is.

As to my statement that the Oregon Trunk and Great Northern adequately serve their territory. (3085.) That had reference to the Bend line from Wishram south to Bend, on the Oregon Trunk and then on the Great Northern line down to Chemult and the joint use line down into Klamath Falls.

As to the possibility of traffic from Klamath County and from Bend being diverted to the cross-State line, if that were built, I have made no estimates and could give nothing more definite than that possibility to indicate the extent of the diversion, but I spoke particularly of the northern part of Klamath County, where I understand from the Newell study it was proposed to divert that traffic via the cross-State line, and also that the study contemplated quite definitely the diversion of that portion of the Bend traffic that was now being handled by the Union Pacific. My statement was, that if it resulted in the diversion of any traffic in northern Klamath County, or from Deschutes County, which the lines which I represent were builded to take care of, that we would exert every reasonable effort to prevent that.

Q. Would you say, Mr. Pickard, that in any real sense the Oregon Electric and its connections, the Northern Pacific and Great Northern and S. P. & S. at Portland, afforded a competitive route and a competitive service for the lumber traffic generally (3086) of western Oregon to the East?

A. The S. P. & S. does in connection with the Southern Pacific. It affords a route that moves a considerable volume of the lumber traffic from western Oregon. The Oregon Electric does not.
1680 I said a considerable value of western Oregon lumber traffic was turned over by the Southern Pacific to the S. P. & S. at Portland for 1927. It was approximately 3,500 cars. I think that may be recognized as such. That was lumber alone.

Q. (By Mr. McCulloch.) I understood you to say that the Oregon Electric could not stand any more railroad competition in the Willamette Valley.

A. I don't know that I said just that. I said that the Oregon Electric would use every means at its command to prevent the diversion of any Willamette Valley traffic that is now in it, and if that were contemplated by the construction of the cross-State line, the diversion of that traffic to that line was what it would apply to.

The traffic that the Oregon Electric has had since it has operated as a freight carrier in the valley has been almost 100 per cent

traffic diverted from the Southern Pacific (3087) or substantially so. The Oregon Electric has been to Eugene since 1912 and since 1907 or 1908 has had its first operation to Salem. I think it came into the hands of its present owners about 1909.

Q. Did I understand it was your opinion, Mr. Pickard, that there would be no substantial advantage except the possible advantage of shortening of distance to the western Oregon shippers, from the construction of the cross-State line?

A. I said so far as the lumber traffic was concerned, and that constitutes such a large portion of it that I felt that the difference in distance was relatively unimportant on the lumber traffic.

Q. Well, I recall that in the Klamath Basin cases, particularly the finance docket application of the Oregon Trunk for permission to construct into Klamath Falls, the position was taken by your company that its construction into Klamath Falls would
1681 open up a large additional market for lumber (3088); to quote exactly, after referring to the different Northern lines, "with a total mileage of over 27,000 miles, reaching by themselves and connctions widely distributed markets for timber products and thus covering, by practicable and desirable routes, many States not now conveniently reached by the timber to be marketed from the territory to be served." Now I wonder, Mr. Pickard, why the situation would be any different as to the Union Pacific than it was as to the Oregon Trunk and its connecting lines?

A. Well, I can't speak for the Union Pacific, but in the Klamath extension case, as you say, we asked for permission to build in there to give those plants which were there and those which were contemplated, access to the Northern lines' markets, including the Burlington. Our position here is no different. We said in the Klamath case we felt the difference of 200 miles was immaterial, so far as the lumber traffic was concerned.

Q. But would there not be a similar advantage to the producer of lumber through the construction of the cross-State line as there was to the same producers of lumber through the construction of the Oregon Trunk or Great Northern into Klamath Falls, in that it opens up a new and additional territory for market purposes?

Mr. HART. You mean to the Willamette Valley lumbermen? Is that what you are talking about? (3089.)

Mr. ELLIS. To the Willamette Valley lumbermen and any other territory reached?

A. Well, I don't care to speak for my neighbors, but, so far as I know, those shippers have access to all of the important markets to-day with existing rates and routes.

1682 Q. Well, did they not have the same access at the time the Northern lines were applying to go into Klamath Falls? Did they not have access over the same routes, on the same basis?

A. They did not. There were no through rates in effect from Klamath Falls to the Northern lines territory. I don't know that I

could say why they were not. The Southern Pacific could probably answer that better.

Mr. HART. They could not, except via Portland, which was on the coast basis, could they?

A. Well, there were no rates via Portland to Klamath Falls.

Comr. MCMANAMY. How much of a difference in distance would you consider it necessary to justify the construction of a new line—you say to shorten it 100, 150, or 200 miles wouldn't do it—for hauls of 1,500, to 2,000 miles?

A. Well, I should think it would depend entirely upon the commodity; and then it would depend again, Mr. Commissioner, on the question of whether the longer route was able to give equally expeditious service as the shorter one, which is not an uncommon thing. I might give you an illustration of that. Take from Puget Sound to Spokane; the Milwaukee has substantially shorter mileage than either the Northern Pacific or Great Northern; the service is practically identical over all routes. So that the difference in distance there—and that total distance is only some three hundred miles. That is a shorter haul.

Comr. MCMANAMY. Suppose we take Portland to the Twin Cities when the S. P. & S. were built; how much did it shorten the line haul?

1683 A. I don't think it shortened it perceptibly, because in those days, if my memory serves me correctly, western Oregon traffic could move via Wallula in connection with the O. R. & N. thence the Northern Pacific.

Comr. MCMANAMY. I was speaking of traffic from Portland.

A. I meant Portland traffic; it could route via the O. R. & N. to Wallula, thence Northern Pacific to Twin Cities. The difference in distance was not perceptible resulting from the construction of the S. P. & S. As to whether the Northern Pacific would accept Portland traffic at Wallula: It did then; also it had its own line from Portland through (3091) Puget Sound over the Cascade Mountains. There was no perceptible shortening of distance. I don't think I can make a very definite answer to your question, because I think it will depend altogether on the comparative service.

Comr. MCMANAMY. How much was the mileage shortened between the Twin Cities and Portland by the S. P. & S. as compared with the Northern Pacific?

A. About not to exceed two hundred miles. But the shortening of the distance was not necessarily the factor which resulted in the construction of the S. P. & S. It is ancient history—the Northern lines were in very much the same position as Mr. Lounsbury testified in 1905. The S. P. & S. was started in 1905. The volume of this traffic moving all rail was so great that existing lines were overburdened, and this was an alternative route that was selected and constructed by its owners. It furnished substantial relief until such time as the opening of the Panama Canal (3092) and the

diversion of traffic to the water route. Then we find all of the lines in need of additional traffic again, that so changed the trend of traffic. (3093.)

1684 As to whether the Spokane, Portland & Seattle ever was an especially busy line, it never has been utilized to anything like its capacity, although it handles a substantial traffic. It handled 36,000 cars of lumber in 1927. Lumber is its major item of traffic.

As to how its traffic density compares with other lines: Its traffic density is greater in ton-miles, I think, than the Oregon-Washington Railroad & Navigation Company.

If the construction of the cross-State line will open up new markets to the Willamette Valley, then I would say that it would be of some advantage to the Willamette Valley lumbermen in addition to the advantage of distance.

Q. Do you recall the position of the Great Northern and Oregon Trunk as taken in the Klamath Basin cases, with reference to allowing the Union Pacific lines joint and common use of its tracks when constructed from Bend south?

A. I don't recall any such testimony, Mr. Ellis. I do know that Mr. Budd, president of the Great Northern, testified as to his entire willingness to join with the Southern Pacific part of the way in reaching the Klamath Basin. I don't recall any testimony about their being willing to let the (3094) Union Pacific use the line south of Bend. If there were such testimony, I think I would have known it. I don't recall it at all. If it is in the record, it speaks for itself.

I am not in position to make any statement as to the position of the Great Northern in that respect at this time.

Mr. Ellis. Has it not been the policy of the Northern lines generally, particularly of the Great Northern, as expressed throughout these hearings and in the press generally, to approve and advocate joint and common use of trackage under circumstances such as would exist here with the construction of the cross-State line and connection at or near Crescent Lake?

1685 A. You mean joint use, for example, from Crescent Lake to Bend or from Crescent Lake into Klamath?

Q. Both.

A. This, I think, summarizes the position of the Northern lines as expressed in the Klamath case, that they are perfectly willing to join in the use of an existing line where that can be done and that line is of such construction that they can (3095) utilize it and where to do that will avoid wasteful duplication of expenditures.

Mr. Hart. That is, Mr. Pickard, where additional facilities are justified and where otherwise there will be a duplication of capital investment?

A. In all cases assuming, of course, that the construction is at all justified.

Exam. Rogers. In the Klamath Basin case the Great Northern sought the use of some other lines, didn't it?

A. They to-day use the Cascade line of the Southern Pacific from Chemult into Klamath Falls.

I am hardly in position to say if that had anything to do with their attitude as to the joint use of track, the fact that they were then seeking the use of somebody else's track.

Mr. HART. They haven't put themselves into any inconsistent position, I may say, Mr. Examiner, on that question.

Mr. DEY. You have always favored joint use of the other fellow's track?

Mr. HART. We haven't put ourselves in any inconsistent position on that.

Mr. ELLIS. One more question. Are we to understand from your testimony that at the present time there is no need for further transportation facilities (3096) in any of this area east of your line extending from Bend south?

6186 Mr. HART. Well, that is not what the witness said. Of course there is need for a railroad where no railroad is today, but whether there is public convenience and necessity for it is another question.

Mr. ELLIS. Putting it on that basis, do I understand it to be your position that there is no public convenience and necessity requiring any additional railroad construction east of your line extending south from Bend?

A. That is my judgment about it.

I don't think the position of my company is any different now than it was at the time they applied for a certificate to extend into the Williamson River territory south of Silver Lake. That is essentially a part of an independent line which we asked permission to build in order to reach the Klamath Basin.

Q. Well, that line as you proposed it did reach and serve a substantial area of territory not reached by your present facilities, did it not?

Mr. HART. Well, the question is leaving out material facts which you know should be included, Mr. Ellis. You know that (3097) the Great Northern became a half owner of the Oregon, California & Eastern, which has the right to build up into that very region, and that territory will be served when facilities are needed. Shouldn't that be included in your question?

A. That was a part of an independent line which we asked permission to construct in order to get into the Klamath Basin territory, as far as the Williamson River country is concerned.

Q. Looking at Exhibit 3, do you recognize the location indicated on that map, the O. C. & E., as the location of the constructed railroad from Klamath Falls up to Sprague River by the Oregon, California & Eastern Railway?

A. Yes, sir. (3098.)

1687 The broken lines extending beyond there, from Sprague River up north to Silver Lake and on north and east to Lake-

view indicate projected extensions of the Oregon, California & Eastern.

I am not certain whether there is an extension under construction there now beyond Sprague River to a place called Bly. What I am interested in in this Klamath case, Mr. Spencer, after the permit had been obtained the entire matter was taken over by the Great Northern, and has been in their hands ever since that time. I have no relation with it at all.

Q. Well, you haven't heard anything about construction going on there by the Oregon, California & Eastern into Bly? Does Bly appear on the map?

Mr. HART. Yes; there is an extension under way, Mr. Spencer.

Mr. DEY. Twelve miles of new extension now being built by the Great Northern and Southern Pacific through their ownership of the Oregon, California & Eastern.

Mr. SPENCER. Now, these projected lines, there, Mr. Pickard, in any event, reflect the purpose of the Oregon, California & Eastern, as you understand it, to serve those (3099) timbered areas?

A. Yes; it is timbered area on the route extending up to Silver Lake. When that line is extended up to Silver Lake, it doesn't seem to me there would be any tonnage from the territory south of Silver Lake, the timbered country territory, to the cross-State line indicated in yellow on this map, Exhibit 3.

The Oregon, California & Eastern is jointly owned by the Great Northern and Southern Pacific.

Q. Now, you spoke of investment there of $3,200,000 in the line from Bend down to Chemult. How much of that route is covered by the existing logging railroad of the Shelvin-Hixon Company?

A. Approximately 22 to 25 miles.

1688 I understand the Great Northern has purchased that line, all of the main line, not including, I guess, logging spurs running out into the timber. (3100.) I understand t ey bought the entire line. Mr. Dey just mentioned 75 per cent interest. I am not sure just what basis it is on.

Mr. DEY. It is just hearsay with me. I haven't any information on it.

Mr. SPENCER. What is the fact as to whether they are making a survey and study there to rebuild or build another line because of the unsatisfactory physical conditions and location of that logging railroad?

A. My information is that they have had some difficulty in rehabilitating that logging line and making it suitable for their purpose.

Q. The point I am trying to make, Mr. Pickard, is whether or not the investment of three million dollars plus between Bend and Chemult does fairly reflect the investment that will necessarily be made between those termini for a railroad?

A. Not if the physical characteristics of this logging line are such that it can not be utilized to advantage as a main line by the Great

Northern. Even if it can be rehabilitated—there will be more money spent, of course, if it is to be either rebuilt or relocated, or if they have to build a new line. (3101.) They have their own survey, the old original Oregon Trunk survey adopted by the Great Northern.

Mr. SPENCER. Are you or are you not in a position to say whether or not the Great Northern Railroad Company would either sell an undivided half interest in that railroad between the junction of the proposed cross-State line and the Great Northern at Bend, or whether they would permit the Oregon-Washington Railroad & Navigation Company to use that line jointly?

A. I don't think it has ever been considered, Mr. Spencer;
1689 no such proposal has ever been made to the Great Northern.

I was here when Mr. Newell's study contemplating that kind of arrangement was presented. He said it would be logical to permit such a thing.

I did not say that the Oregon Electric found great difficulty in developing lumber traffic in western Oregon; I said it didn't participate in the lumber traffic because it didn't reach the large lumber producing points. By that I meant the mills that are in production. (3102.) And if it would experience difficulty in getting into the mills after 12 or 14 years' operation, more or less, I can't see that a cross-State line terminating at Crescent would have any opportunity. Or if it extended its line into the valley, into Eugene, as to its opportunity to obtain traffic from the production, it would certainly meet the determined opposition of the two lines already there.

As to sawmills at Eugene, just across the river from Eugene there is the large Booth-Kelly mill at Springfield, only two or three miles, but it involves the crossing of the Willamette River.

I spoke of 2,500 cars of (3103) lumber being given the Spokane, Portland & Seattle by the Southern Pacific in 1927 at Portland.

Exam. ROGERS. Do you know where that lumber originated?

A. The Southern Pacific Lines in Oregon north of Leona, the point that was mentioned here the other day as being the rate-breaking point. It was going east of Spokane. It might be Montana, the Dakotas, Minnesota. As to whether any of it went to mid-western States: I think the distribution is about as general as all fir distribution in this north Pacific coast. You will find its market in all the middle western section of the States. I can't make that any more definite without giving a rather complete
1690 outline of the rates. Leona is just about (3103) the dividing point between the Umpqua and the Willamette Valleys. It is in the Cottage Grove district. (3105.) That lumber is routed by the shipper or consignee.

Redirect examination:

Q. (By Mr. HART.) The impression may have been given by what you have said that the Oregon Electric hasn't made a determined effort to get the freight business. Will you state whether or not consideration has been given constantly of the methods or means by

which the Oregon Electric might get into the lumber producing sections of the Willamette Valley?

A. I think the Oregon Electric has more projected lines on paper than any railroad in the world in order to enable it to participate in the lumber traffic of western Oregon. It has been a constant study during all of these years whether it would be worth while to spend additional money to try to reach more sources of traffic. The Booth-Kelly mill, near Eugene, is an example.

Many times we have adopted plans in the hopes of getting more of the traffic. (3106.)

I do not think that any other railroad with any different ownership in the Willamette Valley in the situation of the Oregon Electric could have done any better during those years in this effort to get more of the traffic.

Q. Directing your attention for a moment to the proposed extension of the Oregon Electric from Albany eastward into the timber, is it expected that that road with that extension will originate a lumber traffic, or will it haul logs into the mills at Portland and at tidewater?

A. Well, it is hoped that it will originate a substantial volume of lumber traffic but it is also expected that there will be a
1691 large tonnage of logs in their natural form offered to it, if it is permitted to build this extension, for transportation to the Columbia River markets.

It is true that the larger mills on tidewater are reaching farther all the time into the timber for their logs and it comes about naturally by reason of the timber that lies closer to these main waterways being cut off. As time goes on they will have to go farther and farther into the interior for their logs. I think an average length of haul on logs from this extension into Portland will be about 125 miles. (3107.)

Recross-examination:

The Oregon Electric is situation between two parallel lines of the Southern Pacific between here and Eugene. We have no branch lines here whatever extended between those two parallel lines of the Southern Pacific into the timber or into any territory not served by the Southern Pacific. Admittedly it is disadvantageously located and has something to do with the fact that we have not developed substantial freight traffic.

Q. Well, don't you think the showing would have been much better if you had extended some of these branch lines that you are now considering into the timber a few years ago?

A. No; I don't think that that could occur, Mr. Ellis in advance of the demand for logs from greater distances than which they are now being hauled in order to supply these tidewater mills.

Mills off of our lines (3108) have made efforts to get our service only in times of emergency, when sufficient cars might not have happened to have been available.

Q. And at times when the market on the northern lines was calling for lumber from those regions?

1692 A. Well, I think it is an unusual situation where the demand on the northern lines in the markets reached by those lines would be appreciably more attractive than the markets, we will say, on the Union Pacific.

Q. But how about the markets of the Southern Pacific? The Oregon Electric doesn't compete with the Union Pacific in the Willamette Valley.

A. No; but I am speaking about the northern lines, the Great Northern, Northern Pacific, and the Burlington, as contrasted with the Southern Pacific-Union Pacific route through Portland, or through Ogden, for that matter.

I do not solicit traffic for the Burlington. They have their individual representation here in the northwest, in all of the important traffic producing centers; and the Spokane, Portland & Seattle has its independent organization, similarly.

Mr. ELLIS. Is it not true that the Oregon Electric has been able to get traffic from the Southern Pacific by reason of its car supply at times?

A. I recall cases of that kind, Mr. Ellis. It seems to me it goes back to 1915, '16, and '17, prior to Federal control, where we were called upon to provide cars, or the shipper found it advantageous to assume some additional expense himself in order to have access to our car supply.

1693 I don't know of any case where that condition has existed within the past four years.

I can't answer your question as to whether a proposed extension to Silver Lake to the Oregon-California & Eastern is under construction. (3110.) Mr. Dey said there were 12 miles under construction or about to be constructed.

Mr. HART. That is on the line toward Lakeview, Mr. Ellis, and not the line towards Silver Lake. Up Sprague River to Bly.

Further redirect examination:

The Oregon Electric does reach the principal cities of the Willamette Valley, Salem, Albany, Corvallis, Eugene, Hillsboro, Forest Grove, and Woodburn.

The Oregon Electric has recently applied to the Interstate Commerce Commission for permission to abandon its branch to Woodburn; its two-mile branch from West Woodburn to Woodburn, because of lack of any traffic to be secured. (3111.) Referring to the statement of the demand made by the shippers in the Willamette Valley to reach our track and cars in 1915, 1916, and 1917, that was prior to the time that the Portland gateway was opened over the Great Northern and Northern Pacific. But since 1917, when those rates were put into effect, the traffic originating on the Southern Pacific lines can move through the Portland gateway to the territories thus served by the Great Northern and Northern Pacific.

H. A. GILLIS was thereupon produced as a witness on behalf of defendants and, having first been duly sworn, testified as follows:

Direct examination:

I live in Portland and am traffic manager for the Western Pine Manufacturers' Association. I have held that position since October, 1927. (3112.)

1694 Prior to October, 1927, I was assistant traffic manager of the Shevlin-Hixon Company at Bend, Oregon. Shevlin-Hixon and Brooks-Scanlon Company both operate large pine mills at Bend. They are members of the Western Pine Manufacturers' Association.

By virtue of my present work and my experience with the Shevlin-Hixon Company, I am thoroughly acquainted with the transportation problems affecting the movement of pine lumber east.

I should say that a difference of 200 miles or thereabouts between two railroad routes from Bend, say, to Chicago or points 1,500 or 2,000 miles distant would make no difference at all.

The Western Pine Manufacturers' Association is a voluntary association of pine producers who are located in the (3113) eastern sections of Oregon, Washington, throughout Idaho and Montana. There are about 35 mills with a total production of about two billion five hundred million. Their product is marketed in transcontinental territory, principally. They are interior mills—located east of the Cascade range of mountains. Their products move by rail.

Q. Now, then, in routing shipments from Bend, and advantages between the Union Pacific system on *on* the one hand, and the Great Northern or Northern Pacific on the other, what do you say as to whether or not a difference of 200 miles between the two routes would affect a choice?

A. Well, your routes and time in transit would make no difference at all.

Q. The fact that one route might be 200 miles longer than the (3114) other to a given destination would or would not affect the choice of the shipper in routing his shipments?

A. No; in routing lumber as much as a week would hardly affect it.

1695 Exam. ROGERS. Take on lumber shipments originating over, say at Bend, and going to some point east of the Mississippi River, say St. Louis or Chicago, how much difference would there have to be between the two routes in order that one might be said to be an unreasonably long route?

A. I had never given that much thought. In shipping lumber service isn't a decided factor, but a lot would depend on the class of material and who bought it. If they wanted it there in a hurry you might consider distance. A matter of time in transit would be a decided factor there. At the present time there are none of the routes that are taking much more time than the other.

In moving lumber, if one route took two days longer than the other I would not say that route was unreasonably long as compared with the other. I wouldn't think that three days would be. (3115.)

Q. (By Mr. HART.) Mr. Gillis, do you know whether or not the service now rendered the Shevlin-Hixon Company and Brooks-Scanlon by the railroads at Bend, the Union Pacific system lines and the Northern Pacific and Great Northern through the Oregon Trunk, is or is not reasonably satisfactory, or whether or not those lumber shippers feel the need of additional and shorter transportation facilities to the East?

A. Well, they are very well satisfied with the present service. There are only two mills operating over there.

Cross-examination:

The two large mills at Bend are served by the Oregon Trunk and the Oregon-Washington Railroad & Navigation Company. Southbound they are served by the Great Northern.

1696 At present and during the past, the business of those two Bend mills east has been divided between the Union Pacific and the Northern lines. (3116.) It was usually divided 60 per cent Oregon Trunk and 40 per cent Oregon-Washington Railroad & Navigation Company. That was because the Oregon Trunk was owned jointly by the Great Northern and Northern Pacific—that would divide the tonnage upon a more equitable basis between the three trunk carriers.

I understand if the cross-State line from Crane to Crescent Lake were built, that would intersect the Great Northern's line from Bend back to Chemult at a point a short distance south of Bend.

Q. Now, if that cross-State line were built by the Union Pacific system lines, or by the Union Pacific system in conjunction with other lines, would there be any reason you could see why, if the cross-State line afforded a somewhat shorter and less expensive route to the east than the Union Pacific's line down the Deschutes Canyon to Sherman and then taking the Columbia River route over the Blue Mountains, a substantial part of that 40 per cent of the eastern shipments of the Bend mills that the Union Pacific system lines have gotten in the past wouldn't be sent down to a connection with the cross-State line and thence east via Crane and the Union Pacific system lines? (3117.)

A. In other words, a choice of routes. Well, I don't know how they would move it, but it would seem to me their investment would be there just the same up in the canyon, the Deschutes Canyon, and it would be immaterial how they would move it out.

1697 Q. However, as to the 40 per cent of the business of the pine mills that the Union Pacific has gotten in the past, with the construction of this cross-State line that lumber, or 40 per cent, would have two possible routes to eastern markets, one through Sherman and the Columbia River route over the Blue Mountains,

one down to the cross-State line junction and then east through Crane?

A. Yes.

I would expect with the construction of that line there would be an appreciable part of that 40 per cent of production of the two Bend mills that would come down to the cross-State line and go east that way. It would not make any difference which way the Oregon-Washington Railroad & Navigation Company moved it. They would go through the same junction. As I understand it, this Crane line comes out at Ontario Junction east over there—all of this traffic, all the lumber sold moves (3118) through Ontario Junction. It is just the question of selecting your route at the point of origin, that is, the movement from there. (3119.)

As traffic manager of the Western Pine Manufacturers' Association, I have nothing to do with the routing of shipments of lumber mills. I could recommend routings, if for some reason they were being abused, I suppose. I am never asked to recommend routings by lumber mills.

When I was traffic manager of Shelvin-Hixon Company, I specified routing of its shipments east in the bills of lading. As to what considerations determined the routing I would specify for the shipments east, our principal consideration was just the division of traffic. If there were 20 cars shipped that day, we gave 60 per cent or 12 cars to the Oregon Trunk and split those evenly between the Great Northern and Northern Pacific, and the balance would go by the O.-W. R. & N.

1698 Q. Now, did the destination or destinations of these shipments have anything to do with, or any influence on, the routing which you specify?

A. Well, you would have to tell me what destination you referred to. For instance, east of Chicago, Chicago and east, why it would not make any difference at all which line handled it. To a point like Minneapolis, you would naturally give it either to the Northern Pacific or Great Northern, depending on what delivery they asked for. If the destination was a point on the Union Pacific Railroad or the Oregon Short Line Railroad, or a connection of those lines east of Missouri River and west of Chicago, I would route it to Union Pacific destinations. If it were to an eastern connection of the Union Pacific; suppose it was to a point on the Chicago & North Western between Council Bluffs and Chicago, I would not pay much attention to it. The rates are the same via all routes, and if the car we ordered was the right size, and so forth, we wouldn't pay much attention to it.

I had nothing to do with the selling of lumber for the Shelvin-Hixon Company.

As to whether we received instructions with respect to time of delivery required on (3121) certain shipments, occasionally an order would come in specifying a certain route, but I presume as a matter of time or preference of some kind.

I was with the Shelvin-Hixon Company from April, 1918, until the end of September, 1927.

Q. Now, in that nine-year period do you recall any instances of instructions from the sales department to you calling for the insertion of a routing in a bill of lading that would insure the quickest possible movement to a destination where the sales department had sold a car of lumber?

1699 A. There might have been some instances like that.

The mills in the Western Pine Manufacturers' Association have mixed woods, the same as they have in other districts. But it is principally pine timber. The members of the association are cutting the same species of woods, generally speaking; (3122) also they are producing the same varieties and items and grades of lumber and lumber products.

There are sawmills in the pine district that don't belong to the Western Pine Manufacturers' Association. All of these mills, those who are members and those who are not, that are operating in the pine district compete with each other in the sale and shipment of lumber and pine lumber products in eastern markets. This competition has been very keen since the reconstruction period shortly after the war.

I would not say that abilities to make deliveries of lumber as specified in point of time by purchasers was an important element in the ability of a particular mill to meet successfully competition of other sawmills in the pine territory. (3123.)

The orders received by Shelvin-Hixon Company or by the Western Pine mills don't, as a rule, specify a time within which they should be delivered. They will usually specify a time they should be shipped and take it for granted it will be there on a certain specified day after that.

Q. Another witness here, Mr. Gillis, in this case, from the fir producing region in western Oregon, testified that in recent years quite a change had taken place in the marketing of fir lumber and

1700 fir lumber products; that it used to be that orders would be received which could be filled in sixty or ninety days, or even six months, and perhaps for a considerable number of cars at a time, but nowadays often orders were received for a car with specified delivery within 30 days that might be made up of a whole series of special items that would have to be cut after the order was received. Do you know whether conditions are similar in the pine industry at present among the mills of your association to those described by the witness I have just mentioned? (3124.)

A. Yes; I would say they were the same, with one exception; that is, that a pine mill carries these various items in stock. All pine is shipped dry.

Q. Now you mentioned a saving in distance of 200 miles out of a total haul of 1,800 miles of lumber you thought was unimportant. How much would you estimate in time a saving in distance of 200 miles would represent?

A. Well, continuous running?

Q. Well, as cars of lumber or pine lumber are handled east from Bend and from the other mills in your association. You must know in a general way, Mr. Gillis, about how fast they move. Now I wish you would translate that saving of 200 miles in distance into an equivalent of days or hours, if you can, as nearly as you can.

A. That would be pretty hard to do. For instance, it takes from Bend about ten days to get back to either the Twin Cities or Omaha, and about 12 days to Chicago. Now here is a solution there. It is approximately 400 miles between Minneapolis and Chicago, and the service there is two days, so is might mean a difference of 24 hours.

Q. Now as the total length of haul decreased wouldn't a saving of 200 miles in distance become more and more important?

You (3125) said out of a total haul of 1,800 miles you didn't
1701 think 200 miles saved in distance would amount to anything?

A. No.

Q. Now as the haul diminished, was less than 1,800 miles, and become less and less wouldn't this saving of 200 miles in distance become relatively more and more important?

A. Well, I suppose you could draw that into a point where it would.

Q. Well, at what point do you think, or what total length of haul do you think you would have to have where a saving in distance of 200 miles would be of real importance to a lumber shipper or consignee?

A. Why, I think it would have to be some immediate neighborhood. A man might call up on the telephone and want some lumber the next day, but if it did not arrive there for two days he would know there was something radically wrong. But practically all the lumber is sold to transcontinental territory, and I suppose you can find routes that we are using right now that might be 200 miles longer than the other. But I don't know that the time makes any difference over them, or whether there is any difference in time.

We have had the experience, especially during war time, of tracing cars and attempting to ascertain reasons for delayed movement to destination. (3126.) We very seldom have a case of that kind any more. I will qualify myself there. The man most interested in the service is the consignee, and he usually does the tracing, because he is located back east somewhere and it is easier for him to get in touch with the particular carriers that are shown in the bill of lading and obtain that information. He very seldom wires the mill.

1702 Some complaints about time in transit or delayed delivery have come to my attention as traffic manager.

Q. Mr. Gillis, as between two routes, even to Chicago or points east of Chicago, where there was nothing to choose between the two routes, except by one a saving of 200 miles in distance, other things being equal, and you having no reason to want to divide up the

traffic between competing railroads, which of the two routes, if you were a traffic manager or a lumber manufacturer would you use?

A. Well, there are two many things involved to say. Over one particular road you may be asking for some concession or other in the way of a rate matter, if you are referring to just one (3127) particular car. If it is the volume you think of, I don't think the question is altogether clear.

Q. Suppose the Oregon Trunk did not serve Bend, but the Union Pacific did, and the Union Pacific had this route through Sherman and then up the Columbia River and over the Blue Mountains and east through Huntington; suppose this cross-State line also were built and you could come down from Bend to the cross-State line and route east over the Union Pacific that way, and your route through Crane was 200 miles less than your route through Sherman, and whichever way it moved it would move Union Pacific. Now as traffic manager of one of the Bend mills, under such circumstances, how would you route your company's traffic all points east, Chicago, everywhere?

A. I think it would be divided just the way it was before. If the Oregon Trunk was there.

Q. No; I said if the Oregon Trunk was not there. Suppose you just had two Union Pacific alternative routes, and one was
1703 200 miles (3128) shorter than the other——

A. I don't think we would route it at all. That would be left up to the carrier that served the territory.

With respect to demand for lumber in eastern markets on short delivery, the pine and fir industry are substantially the same except we carry dried pine in our yard.

Q. Am I to understand from that answer that the buyers of pine lumber in the East are carrying smaller stocks on hand than they were, and are relying on the yards or mills in the West to supply their demands as they need them?

A. Yes. They are doing business on a hand to mouth basis now. In other words, the mill carries the stock. That affects the pine as well as the fir industry. The mills I represent are east of the Cascades. The presumption is that it carries a demand for quicker service between your mill and the consignee.

The practical effect is as follows: There was a time before the establishment of the regional advisory board, especially, when the service to the eastern markets was very poor. In other words, I have seen cars tied up in yards out here as high as forty days without moving, and since the service has been corrected and you can depend on it the retailer takes advantage of that point and does not carry the stock on hand now that he used to. Formerly a man would come in to buy lumber from him and he had the stock there, where now he tells him that he can wait a week or so and he will have it for him, and ordinarily a man building a house, a matter of a week or two of course dosen't make a great deal of difference.

Exam. ROGERS. Well, what we are getting at is, whether this policy or practice on the part of these lumber dealers to carry less
1704 stock on hand has resulted in a situation where a matter of one or two days less time in transit is a matter of considerable importance. Ordinarily how much difference in time would you think it would have to be to make a difference to these lumber dealers, which you say are dealing (3130) on a hand to mouth basis?

A. I would say possibly a week.

Redirect examination:

It is a matter of dependability of service rather than a shorter time. A retailer now knows what he can depend upon in the matter of transportation service from the mill to his yard. And as a result of that he does not carry the stock that he formally had to when he never knew how long it would take to get his lumber moved from the mill to his retail yard. Under the present conditions the retailer knows what he can depend upon, and it does not make any difference whether his transportation is to be a week or ten days, as long as he knows what it is to be. There was a time when if he got it under two months he thought he was getting good service. Now he expects it under a month. This came about after the institution of the regional advisory board; about three years. They established them back East before they did out here. (3131.)

As to the capacity of the mills: The Shevlin mill will produce 750,000 a day and the Brooks mill about 700,000. That is two 8-hour shifts. These mills at Bend compete directly with pine mills in Idaho. The Idaho mills are two to three days closer to the markets. Idaho mills do not have the same rates we do. Bend is what they term naught-eight territory. It is intermediate territory between the Spokane group and coast group. Idaho has a lesser
1705 rate. Idaho takes the same rate as Spokane. Those rates were fixed by the commission in the Potlatch case. (3132.)

H. E. GODWIN was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am general freight agent of the Oregon Short Line Railroad Company with headquarters at Salt Lake City. The railroad headquarters are also at Salt Lake City.

I have been with the Oregon Short Line since 1897, 22 years of which period was in the traffic department, nine years as assistant general freight (3133) agent and four years as general freight agent.

The Oregon Short Line Railroad Company is one of the several units of the so-called Union Pacific Railroad system. This Oregon Shore Line Railroad Company operates some 2,540 miles of railroad. It owns all of this mileage except some 157 miles owned by the Oregon-Washington Railroad & Navigation Company, extending from a connection with its main line about a mile and a half east of Ontario in Malheur County, Oregon, in a southwesterly direc-

tion for 157 miles to Burns, the county seat of Harney County, Oregon, and except a short piece of mileage extending from Vale in a northwesterly direction to Brogan, a distance of approximately 23.74 miles.

Until December, 1924, this branch line terminated at Crane in Harney County, but it was extended from Crane to Burns, a distance of approximately 30 miles, in 1924, and opened for
1706 operation in the month of December of that year. The extension to Burns from Crane was made upon the confident assurance that a sawmill operation was to be established at Burns for the manufacture of pine timber to be cut and transported in the log from the Malheur National Forest north of Burns. (3134.)

To this end a railroad line was graded by a corporation known as the Malheur Railroad Company from Burns in Harney County north to Seneca in Grant County, Oregon, the terminus being in the heart of the operation contemplated by the agreement between Fred Herrick and the United States Forestry Department, by which agreement Mr. Herrick was purchasing from the Government his timber supply for the operation of his proposed mill.

The contracted stumpage between Mr. Herrick and the Government amounted to about 890,000,000 feet and the contemplated cut was to be from 50,000,000 to 60,000,000 feet per year. The Malheur Railroad Company was a Herrick enterprise.

As a part of the plan contemplated by his contract with the Government Mr. Herrick caused to be organized the Fred Herrick Lumber Company, with its principal office and place of business at Burns in Harney County. By reason of his failure to complete and place in operation the mill and the railroad, Mr. Herrick's stumpage contract with the Government was canceled by the Forestry Department in 1927, and none of the timber has been cut nor can it be cut or manufactured into lumber by Mr. Herrick or his organization.

The only other mileage operated by the Oregon Short Line that is not owned by it consists of a branch line owned by the Oregon-Washington Railroad & Navigation Company extending from Blakes Junction in Baker County, Oregon, about a mile and a (3135)
1707 half east of Huntington, down the west bank of the Snake River for a distance of approximately 56 miles to Homestead.

The western terminus of the Oregon Short Line Railroad Company is at Huntington, Oregon, where it connects with the Oregon-Washington Railroad & Navigation Company's main line track extending westerly to Portland, Oregon.

The eastern terminus of the Oregon Short Line Railroad Company is at Granger, Wyoming, where it connects with the tracks of the Union Pacific Railroad Company.

The Oregon Short Line also has a main-line track extending from Salt Lake City, Utah, in a northerly direction to a connection with the foregoing east and west main line at McCammon, Idaho. From

McCammon it operates over the east and west main-line track to Pocatello, Idaho, and from there it proceeds north through Idaho Falls to Butte, Mont. This main-line trackage amounts in the aggregate to 1,012 miles.

The remainder of the system trackage of the Oregon Short Line Railroad Company, amounting to a total of 1,527 and a fraction miles, consists of branch-line mileage. The location of this trackage, comprising the system of the Oregon Short Line Railroad Company and the territory served thereby is reflected by a map now submitted as an exhibit. (3136.)

(The map referred to was received in evidence marked "Defendants' Exhibit No. 73, Witness Godwin.")

The home office of the Oregon Short Line Railroad Company is at Salt Lake City, Utah, where its general offices are located and from which point its operations are managed and conducted. At Salt Lake City, Utah, it connects with the railroad of the Los Angeles & Salt Lake Railroad Company, the main line of which extends from Salt Lake City to Los Angeles.

1708 The Los Angeles & Salt Lake Railroad Company is also another unit of the so-called Union Pacific system, and its general offices are at Los Angeles, Calif., from which point its operations are conducted.

The western terminus of the Union Pacific Railroad Company is at Ogden, Utah, which point is reached by its main line extending west from Omaha through Granger, Wyo., to Ogden.

During the past 25 years the semiarid lands of the southern Idaho country served by the trackage of the Oregon Short Line Railroad Company have been gradually and progressively reclaimed by irrigation made possible by the available (3137) waters of Snake River and its tributaries. As this reclamation work has progressed the Oregon Short Line has extended its branch-line construction into these areas, and the extensive branch-line trackage in southern Idaho has resulted as a consequence to efficiently serve the reclaimed territory and the areas tributary thereto.

The irrigated areas in question, to the extent same obtain west of Pocatello, Idaho, appear colored in green upon the map already introduced in evidence as Exhibit 13, and the total acreage of same amounts to approximately 1,400,000 acres.

Interspersed in the already irrigated areas referred to are various additional areas proposed to be reclaimed, and in part authorized and provided for, the total acreage of which amounts in round figures to about 194,000 acres. These prospective areas are outlined in yellow upon Exhibit No. 13. This area of reclaimed irrigated lands and lands considered available for reclamation includes the areas in Malheur County, in Oregon, as well as the southern Idaho areas.

1709 The tonnage originating on the Oregon Short Line between Huntington and Pocatello on the main line and on the va-

rious branch lines built to serve this territory is produced in the main from these extensive irrigated areas. Without them, the large expenditures made by the Oregon Short Line in improving its facilities, and particularly in the construction of its branch lines between Pocatello on the east and Huntington on the (3138) west, would not have been justified.

To the end that these projects might succeed, the Oregon Short Line Railroad has consistently interested itself in the problems of the producer in a much broader way than the mere furnishing of transportation.

It maintains an agricultural department to advise with the settlers in the matter of crop production and marketing.

It has conducted dairy, poultry, seed, and potato demonstration trains and, in cooperation with Idaho University and the experts of the agricultural extension department of that State, it has advised and encouraged development of the dairy industry and diversified farming in general.

To the extent that it might consistently do so, it has made favorable rates to prospective consuming markets for the products of these lands and, in connection with the development of the dairy industry and for the benefit of the poultry and egg producer, has established concentration rates and loading-in-transit rates from the several producing districts to enable the shipping of these products in carloads lots.

The result has been successful and gratifying for both the producer and the railroad company. This is fairly well
1710 illustrated by the accomplishment of the year 1927, when the products from these lands were successfully marketed in all parts of the country, some of them reaching destinations in as many as 45 States. In this connection, effort has been made to (3139) obtain advantageous markets on the coast for these producers, and these efforts have been progressively successful in the Los Angeles market in particular.

The people of southwestern Idaho conceived the possibility of establishing more effective trade relations with central and northern California, and that with a shorter route to that market the problem of excessive production might be effectively solved. To this end, and in response to a very earnest appeal by these Idaho people, the Oregon Short Line Railroad Company constructed an extension of its line that formerly terminated at Rogerson, Idaho, on to Wells, Nevada, where a connection was made with the line of the Southern Pacific Company's main east and west line to San Francisco. This construction was for a distance of 94.7 miles. The extension was opened for operation February 15, 1926.

The western Pacific is also effecting a connection with this Rogerson-Wells line at Wells, Nevada.

The investment in this extension from Rogerson to Wells amounted as of December 31, 1927, to $3,434,322.78.

To date this cut-off has not been extensively used by the shippers from this southwestern territory, and the producers in this territory have as yet been unable to develop extensive markets for the consumption of their product in central and northern California. This condition is due in my opinion in no small degree to the com-
1711 petition encountered by these (3140) southwestern Idaho producers in San Francisco Bay points from the extensive and productive valleys of central and northern California, and from the producers of similar products grown and shipped in an extensive way from Oregon and Washington. In Oregon and in Washington there are extensive areas producing similar products that are less distant by rail, and from which the producers also enjoy the benefit of ocean service from Portland and Puget Sound ports to San Francisco.

Ogden, Utah, is the center of a very extensive, fertile and productive territory, consisting of the Malad and Cache Valleys, which extend for approximately 100 miles to the north, and the Salt Lake Valley extending some 100 miles or more to the south to Provo and Payson, Utah, the entire area probably aggregating more than 1,000 square miles. They produce substantially the same diversified crops, poultry and dairy products as does southern Idaho.

Ogden, a city of approximately 35,000 people, is an important trade center, with extensive facilities for the handling and marketing of livestock and for the milling of flour and by-products. It is 782 miles via the main line of the Central Pacific operated by the Southern Pacific to San Francisco (3141) and 818 miles via the Oregon Short Line and Los Angeles & Salt Lake Railroads to Los Angeles. The shipments of the products of these valleys tributary to Ogden enjoy wide distribution, as is illustrated later in my statement with respect to the products of southern Idaho, and the percentage of its products finding market and disposition in Los Angeles is at least four and probably five times as great to Los Angeles as to central and northern California points, the rates being the same from Ogden to Los Angeles as from Ogden to San Francisco.

1712 Under existing conditions the equidistant point on the Oregon Short Line to San Francisco via Twin Falls and Wells, Nevada, on the one hand, and via Crescent Lake on the proposed route, on the other, is between Cleft and Sebree near Mountain Home. The distances via this existing route through Wells and the proposed route via Crescent Lake to San Francisco from stations Mountain Home and west are reflected by Exhibit No. 74.

(The statement was received in evidence, marked "Defendants' Exhibit No. 74, Witness Godwin.") (3142.)

Q. (By Mr. SPENCER.) You gave the equidistant point, Mr. Godwin, just west of Mountain Home, on this Exhibit No. 74.

A. This exhibit also shows that the distance from Mountain Home to San Francisco is 184.6 miles shorter via the Wells gateway than via Ogden.

I am submitting a statement showing number of tons, by commodities, of carload freight forwarded from all stations on the Oregon Short Line Railroad west of Mountain Home, Idaho, during the year 1923, to destinations in northern California, southern California, Oregon, and Washington. This was Exhibit 73 for the year 1923 in the previous case. (3143.)

(The statement was received in evidence, marked "Defendants' Exhibit No. 75, Witness Godwin.")

(Corresponding exhibit for the years 1924, 1925, and 1926 was received in evidence marked "Defendants' Exhibit No. 76, Witness Godwin.")

The total tons, 1923, California points north of Santa Barbara and Mojave (3144) are 1,567 tons; south of Santa Barbara and Mojave, 8,415 tons. To Oregon, 52,271 tons; and to Washington, 19,523 tons.

For 1924 the traffic from the same originating territory was distributed as follows:

West of Mountain Home, California, north of Santa Barbara and Mojave, 1,578 tons; to California south of San Barbara and
1713 Mojave, 11,946 tons; to Oregon, 53,141 tons, and to Washington, 20,156 tons.

For the year 1925, to California points north of Santa Barbara and Mojave, 3,496 tons; to California points south of Santa Barbara and Mojave, 18,818 tons; to Oregon, 35,392 tons; and to Washington, 14,382 tons.

In 1926 to California ports north of Santa Barbara and Mojave, 2,686 tons; to California points south of Santa Barbara and Mojave, 17,560 tons; to Oregon, 62,519 tons; and to Washington, 16,017 tons. The line drawn south of Santa Barbara and Mojave and north of Santa Barbara and Mojave is the usual division of the California territory. It conforms to the rate adjustments generally.

An analysis of the distribution of substantially all of the agricultural products and fruit and dairy products from the southern Idaho territory for the year 1927 to destinations, by States, was presented.

(Said statement was received in evidence, marked "Defendants' Exhibit No. 77, Witness Godwin.") (3146.)

Exhibit No. 77 consists of a summary sheet and two detail sheets attached and shows the number of cars of the commodities shown from all Oregon Short Line points in Idaho to territorial destinations specified during the calendar year 1927.

Attention is also called to the fact that of all California shipments in the year 1927 from Southern Idaho 2,224 cars moved to points in central and northern California, and that of this number 381 moved via Wells and 1,843 via Ogden and Salt Lake, the movement via Salt Lake being permitted by reason of through rates obtaining at that junction with the Western Pacific.

On the other hand, the shipments from this same originating territory to Los Angeles and surrounding territory of south-

1714 ern California amounted to 5,296 cars. An analysis of this tonnage and its movement demonstrates the preference by the shipper for main-line service, which obviously affords better service and facilities, than over a line with light traffic where limited train service and facilities necessarily obtain.

There is one feature that has not been mentioned that is an advantage and an inducement for this routing. Ogden and Salt Lake City are important trading centers and some of the (3147) commodities involved might well be routed through these commercial centers, with the object of obtaining the market advantages by sale of products in Utah markets or taking advantage of diversion privileges permitting them to divert traffic to eastern markets or to the markets in southern and northern California. This routing is particularly desirable in connection with livestock, grain, and grain products.

Of course, this last exhibit includes all southern Idaho territory served by the Oregon Short Line Railroad and the shipments from points east of Mountain Home and north of Pocatello, and from points extending as far east as the Wyoming border, amounting in the aggregate to more than the total volume of the shipments from west of Mountain Home. This is particularly true with respect to wheat, potatoes, and livestock.

The so-called Oregon eastern branch, owned by the Oregon-Washington Railroad & Navigation Company and terminating at Burns, but operated by the Oregon Short Line Railroad Company, has been operated from Ontario to Crane by the Oregon Short Line Railroad Company since 1916 and the operation extended to Burns since December, 1924. The total shipments from this branch to Oregon, Washington, and California destinations for the years 1924, 1925, and 1926 were as follows, the volume being stated in tons:

1715 In 1924 to California points north of Santa Barbara and Mojave 130 tons; to California points south of Santa Barbara and Mojave 1,242 tons; to Oregon destinations, 10,955 tons; and to Washington destinations 1,858 tons.

In 1925 to California destinations north of Santa Barbara and Mojave 660 tons; to California points south of Santa Barbara and Mojave, 501 tons; to Oregon destinations 5,450 tons; and to Washington destinations 1,038 tons.

(The statement giving above information was received in evidence market "Defendants' Exhibit No. 78, Witness Godwin.")

As to special conditions that may have induced this more substantial movement in the year 1925: There was a drouth in the territory (3149) in 1924 that required that a number of cattle be shipped out of the territory because of lack of feed to take proper care of them. The drouth was in the Burns territory and Crane and all along the Oregon eastern branch from Ontario in there. It was a very severe drouth and several thousand head of cattle were shipped out during the latter part of 1924 and there was some heavy movement early in 1925.

In 1926 to California points north of Santa Barbara and Mojave, no shipments; to California points south of Santa Barbara and Mojave 163 tons; to Oregon points 10,110 tons; and to Washington points 1,948 tons.

I have a similar statement for 1923, presented and filed as an exhibit in the previous case. (3150.)

(Said statement was received in evidence, marked "Defendants' Exhibit No. 79, Witness Godwin.")

As reflected by these exhibits, livestock and the products of agriculture comprise substantially all the shipments off of this branch.

1716 The extension from Crane into Burns in 1924 was made in the hope that a lumber operation might be developed at Burns, but as yet it has not materialized. The extension runs (3151) for about 30 miles over a level country involving no expensive construction, and it extends for the most part through a valley devoted principally up to the present time to the raising of hay by flood waters from the Silvies River drainage, which empties into Malheur Lake. It was conceived that if a sawmill operation could be brought about near Burns, it might expand so as to afford substantial additional traffic for this impoverished line.

I have a statement showing the shipments from Harney County, from these stations, between Crane and Burns.

(The statement was received in evidence marked "Defendants' Exhibit No. 80, Witness Godwin.")

The exhibit shows the movements for the years 1923, 1924, 1925, 1926, and 1927. (3152.)

It will be noted that since the branch was extended into Burns the total shipments from Harney County averaged less than two cars per day.

It has been suggested that livestock would move to the Pacific coast via the cross-State line in preference to the existing route to Portland. The development of the livestock market at Portland, as a market for the receipt and distribution of livestock for the Pacific northwest, has been a matter of growth over a long period of years. Formerly the volume was not sufficient to sustain the movement of stock speicals, and in those years the livestock

1717 was moved in expedited freight trains. Later, with the development of the business and increase in its volume, the livestock from southern Idaho points was brought into Huntington, Oreg., and fed and watered, and a live stock special operated via the O.-W. R. & N. to Portland, the same being sustained by increased shipments obtained en route from Huntington to Portland. Later and with the development of the business in the Puget Sound markets, the operation of the livestock special was extended east to Glenns Ferry, Idaho.

From this point a livestock special is operated through, leaving Glenns Ferry at 7.00 a. m., and Nampa at noon on Friday of each week. It picks up all available shipments along the main line of the Oregon Short Line to and including Huntington, and from

there proceeds into Portland without picking up any additional cars of stock, and arrives at Portland (3153) on a through movement without unloading for feed and water en route.

The statement was made that by reason of embargo obtaining against Idaho hay, it was necessary to stop at Huntington, clean and rebed the cars, but the fact is that hay or straw is not and has not been used for bedding in stock cars, but they are uniformily sanded before the stock is loaded and go through to Portland without inspection or unloading. This livestock special arrives at north Portland stockyards Saturday night at 10.00 p. m.

This service is supplemented by another livestock special which leaves Huntington, Oreg., every Saturday morning at about 8.00 a. m. This special takes all shipments from southern Idaho points brought in from branch lines that were not available or ready for movement on the livestock special leaving Glenns Ferry, and it also picks up all livestock en route west of Huntington This Huntington special comes through to Portland without stopping for feed or rest, and arrives at north Portland yards Sunday about noon.

1718 While these shipments into north Portland include some shipments having Tacoma and Seattle for ultimate destinations, there is one substantial buyer at Seattle, Frye & Company, who consistently unloads his shipments at The Dalles, Oreg., for feed, water, and rest, and does not unload at the north Portland yards, although he buys there extensively. These shipments for Frye & Company, as well as shipments from (3154) north Portland, leave Portland on Sunday night and are unloaded at Tacoma and Seattle the following morning.

From the foregoing it is not to be understood that there has been a large increase in the shipments of livestock into the Portland and Puget Sound markets from eastern Oregon and southern Idaho during recent years, but the business has been such as to justify, in our opinion, the increased service as above outlined. These shipments from eastern Oregon and southern Idaho comprise about 70 per cent of all the livestock transported into north Portland yards.

The main line of the Oregon Short Line and of the Oregon-Washington Railroad & Navigation Company is of a high type of construction, well maintained, with long passing tracks, block signal protection and ample facilities for efficient operations. Such a railroad, with the facilities afforded permits infinitely better service than could be possible over a new line through an undeveloped and unproductive country, not reaching the ultimate terminus but requiring an interchange to another carrier for handling on to destination.

The distance to Portland and to Puget Sound from any point on the Oregon Short Line is more than 100 miles shorter via the present route than via the proposed route through Crescent Lake, the distance from Ontario to Portland via the present route being 432 miles and via the proposed route 535 miles. (3155.)

1719 Furthermore, if the shipments are to be divided and any substantial part of same from Ontario and east diverted to the cross-State line, the special service now afforded by these livestock trains could not be justified. This service has been afforded at the earnest request of the livestock shippers of southern Idaho, and it is inconceivable that they would move any substantial part of their shipments via the cross-State line in the face of inferior service that would necessarily result over both routes.

Practically all of the livestock from Caldwell is shipped through the yards operated by the witness, Smeed. An analysis of all of the shipments from that yard during the year 1927 follows: To Portland, cattle 146 cars, sheep none; to Tacoma, cattle 1 car, sheep 6; to Seattle, cattle 16 cars, sheep none; to Los Angeles, cattle 1, sheep none; to San Francisco, no shipments of either cattle or sheep; to eastern destinations, 6 cars of cattle, 22 of sheep.

The percentage of sheep and lambs moved to coast markets is comparatively small. The market is in the Eastern States, particularly in Colorado, Nebraska, Missouri, and Illinois. During the year 1927 the total shipments of livestock to the Eastern States was some 5,652 cars against a total of 4,198 cars to all points in the Pacific Coast States, the distribution to (3156) the Pacific Coast States from southern Idaho being to Oregon, 1,134 cars; to Washington, 964 cars; to Los Angeles territory, 1,545 cars; and to central and northern California, 555 cars.

1720 Eighty-seven cars of livestock moved to central and northern California via the Rogerson-Wells line in 1927, and it is hoped that the business through that gateway will increase, but it is to be noted that of the 555 cars moving to central and northern California 355 cars moved via Ogden, 110 cars via Salt Lake and the western Pacific, and two via Portland, notwithstanding the fact that from southern Idaho the distance to San Francisco is 184.6 miles shorter via the Rogerson-Wells line than via the route through Ogden.

If the use of the Rogerson-Wells line should become general and justify the expenditure, the distance could be materially shortened by the construction of 28 miles of new line between Tuttle on the north side branch and Buhl on the Twin Falls branch. Such construction would move the equidistant point to San Francisco from Cleft near Mountain Home to Nampa on the main line, and to Sonna, west of Boise, on the Boise main line. These points would be 885 and 891 miles, respectively, from San Francisco, thereby shortening the distance via the Rogerson-Wells line about 45 miles.

The controlling consideration for this movement was the better service and facilities available by main line operation. Not only does southern Idaho find its market for its sheep and lambs (3158) in the East and in Los Angeles, but central and northern California itself ships at certain seasons of the year a considerable volume of lambs to the eastern markets, but this is not true from the Los An-

geles district. Furthermore, central and northern California is an important market for both cattle and sheep, lambs and hogs from northern California, from Nevada, and from western Oregon.

I have been over the proposed central Oregon route and over the route from Rogerson to Wells, Nevada, and there is no compar-
1721 ison in my opinion as to the productive possibilities tributary to the respective lines. While the Rogerson-Wells line does not originate a large volume of traffic, it has a substantial mining operation in prospect at Contact, which was held out as a considerable tonnage prospect at the time the appeal was made for the construction of the line.

Furthermore, there is a large ranch extending along the Rogerson-Wells line for some 30 miles, irrigated by flooding process by waters from Shoshone Creek, Salmon River, and Thousand Springs Creek. These lands are stocked with some 1,500 head of horses, about 20,000 head of cattle, 32,000 head of sheep. There are other smaller ranches operated by the stockmen in the same district. Nothing of this kind is to be seen on the route traversed from Crane to Crescent Lake.

In case the projected line via Crescent Lake is built, there are no commodities I know now produced in western Idaho (3158) that would be produced in larger volume by reason of such construction, neither would it develop the production of additional commodities not now produced, for the reason that irrigated districts much closer to San Francisco have by no means reached the stage of development that has been reached in Idaho, which is not at all dependent upon the San Francisco market.

For illustration, figures taken from the Reclamation Records, a Government publication, of July 1922, page 158, substantially affecting the status of those districts at the present time, show that the Newlands, Nevada, project, distant from San Francisco 274 miles, is only 64 per cent developed; and the Klamath Falls, Oregon, project, 408 miles from San Francisco, is but 72 per cent developed. Both of these projects are natural resources of supply for San Francisco.

1722 In my opinion, no increased movement of manufactured articles from San Francisco would be developed over that now being received by established transportation routes, neither will it change the status of the San Francisco jobber. The Portland jobbers distribute merchandise quite extensively, also those in Baker City to a lesser degree, in competition with jobbers located at Boise, as far east as Boise and Nampa.

While there is more or less movement of coastwise and intercoastal tonnage through the port of Portland, this situation would not be disturbed by the construction of the proposed (3159) line through central Oregon, for the reason that the steamship rates are generally on a parity at all Pacific coast ports, and the traffic would naturally move through Portland, as the distance and volume of the rate for the rail haul would be less than through the port of San Francisco via Crescent Lake.

If it be assumed that the Crane-Crescent Lake line as constructed afforded a somewhat shorter route from the territory Mountain Home and west to San Francisco, I do not believe that an expeditious service could be justified. This is because of the extremely light tonnage, possibility of development along the new line resulting in low density of traffic and infrequent train service.

Conversely, by reason of the greater density of traffic via the established routes, the bulk of the business to San Francisco from the west end of the Oregon Short Line would move via those routes.

Local territory to be served by the proposed new line, because of the very sparse population, will not increase the jobbing of manufactured articles, etc., from Boise, Portland, or Baker.

Consideration should also be given to the fact that the Rogerson-Wells line has been completed, and it affords a shorter route
1723 from the Twin Falls district to San Francisco. This district is about the same in area and produces in very large volume the same commodities that are produced in the territory discussed west of Mountain Home. By the present route through Ogden to San Francisco from a point of 6 miles west of Mountain Home the distance is 1,112.5 miles. From this same point to San Francisco via the Rogerson-Wells cut-off the distance will be 927.9 miles, reflecting a reduction in mileage of 184.6 miles; and from this same initial point, 6 miles west of Mountain Home, via the suggested line through Cresent Lake, the distance to San Francisco is 927.9 miles.

The advantage of the Rogerson-Wells route is manifest because of the density of traffic and operating efficiencies that will attend the movement over the line through Wells to San Francisco.

The equidistant point referred to above involves a transportation service by either route of 927.9 miles.

The service over the suggested route through central Oregon via Crescent Lake will be over an inferior line, with infrequent service and light traffic.

The production from the territory in Idaho east of this equidistant point near Mountain Home amounts to more than 75 per cent of the total production of southern Idaho.

As to the location of these ten southwestern counties: The territory (3161) with respect to southwestern Idaho practically embraces those ten counties. Mountain Home, Elmore County, is the most easterly of the ten counties referred to by Witness Newton.

The production from the territory in Idaho east of this equidistant point near Mountain Home amounts to more than 75 per cent of the total production of southern Idaho, and this business, with the transportation service arranged to take care of it, must naturally attract and take with it a large per cent of the business to the west of the equidistant point, because of its volume and because of service.
1724 There is little distance involved in southern Idaho west of this equidistant point as compared with the entire total southern Idaho production, and the fragment that is left to be attracted to the suggested central Oregon Crescent Lake line is so

small that it would not be a substantial contributing resource to sustain the construction and operation of that suggested line.

While he central California markets are considered as potential for the products of southern Idaho, and they were a consideration in undertaking the construction of the Rogerson-Wells line, it is not yet apparent that these hoped-for (3162) markets will command a substantial part of the tonnage produced in the Twin Falls district.

Actual operation and experience has demonstrated that the production from this territory is distributed over large areas substantially more remote from the fields of production than is central California, but it is hoped that the central California market may afford an increased demand for the excess production now obtaining in this territory.

Public Utilities Commission of Idaho Exhibit No. 5, witness Newton, on page 4, showed total number of carload shipments forwarded from ten southwestern Idaho counties to all destinations. Detail of the shipments from these counties, 1927, is shown on pages 1 to 4 of Newton's Exhibit No. 6.

Total number of carload shipments forwarded from the ten southwestern Idaho counties for the year 1927, 14,582 cars from all of these ten counties to all destinations.

Ada County, in which Boise is located, total shipments 1,359.

1725 Elmore County, in which Mountain Home is located, 223 cars.

Owyhee County, in which is located Murphy, Idaho, McCoard, and Homedale, 926 cars. Murphy is terminus of the Murphy (3163) branch, from which 684 cars were moved to all destinations.

Canyon County of which Nampa and Caldwell are two principal shipping points, total shipments 4,949 cars.

Gem County, principal shipping point Emmett, Idaho, total 1,362 cars.

Valley County, total 795 cars, originated at points on the McCall branch, all of which is moved through Nampa.

Boise County, total 108 cars, also from points on the McCall branch, beyond Emmett, moving through Nampa.

It will be observed there were shipped to all points from these seven counties about 9,500 cars, leaving balance of approximately 5,000 cars originating in Payette, Washington, and Adams Counties.

It is impossible to determine from these exhibits how much of this business they contend might move via the cross-State line, but the Wells line is from Mountain Home, Elmore County, nineteen miles shorter to San Francisco than via the proposed cross-State line; the distance from Boise, Ada County, is 63 miles shorter via Crescent Lake; from Nampa 91 miles; and from Emmett 119 miles.

Traffic originating in other counties referred to is handled through Emmett and the saving in distance via the cross-State line from those points would be 119 miles, or an average shorter distance from the seven counties (3164) via Crescent Lake as compared with Wells of about one hundred miles.

It seems apparent in view of the superior service which can be extended via Wells that they will continue to move through that gateway or through Ogden and shippers elect to use the longer route for reasons of their own.

1726 Payette, Washington, and Adams Counties—carload shipments from the latter county reach the railroad at Weiser—are the only counties from which carload shipments are made that will receive the benefit of the maximum shorter haul via the proposed route through Crescent Lake.

Obviously the small amount of tonnage that would find a market in the San Francisco district would not afford proposed line substantial tonnage.

The location of these more easterly counties would also have same effect on inbound or received carload shipments shown on Newton's Exhibit No. 7, for the same reason, to the existing routes.

Mr. Manson will testify as to how those cars will be assembled to move over the cross-State line.

Referring to the supplemental special, which picks up the local business, and the one that takes the business assembled by the branch lines in southwestern Idaho (3165) and whether it stopped for rest and feed: The second special is made up from parts at Huntington, and it takes with it all the stock from branch lines and main-line points that is not ready for the through special train leaving Glens Ferry each Friday morning at 7 o'clock. The movement from Huntington is completed within the 36 hours to Portland.

I wish to make a statement with respect to Witness Wagner, manager of the Farmers' Cooperative Creamery Association at Payette, who testified to the effect that shipments of carloads of butter were eight days in transit from Payette to Los Angeles. I had a check of nine cars representing period July 6th to August 3d, and I found that these nine cars averaged 116 hours 52 minutes from the

1727 time loading was completed at Payette until arrival at Los Angeles, or slightly less than five days. This same service can be afforded like traffic to San Francisco via Wells, but no doubt would be better time than they hope to (3166) make over the new line across the country to Crescent Lake, thence to San Francisco.

Exam. ROGERS. You spoke of the assurance of a mill operation at Burns. How was that assurance expressed; was it a written agreement, or a contract, or what?

A. Well, the assurance to us, I believe, was through the fact that Mr. Herrick had entered into a legitimate contract with the Government for the purchase of that timber and its manufacture at a mill near Burns. He failed to conform to the requirements of the contract, and it was canceled during 1927.

I heard Mr. Magladry say that if the cross-State line were built certain of the lumber traffic would be routed from the Willamette Valley.

Exam. ROGERS. Would you regard that assurance equal to that that you had with respect to the Crane-Burns extension?

A. Well, that is merely an opinion. I don't think that the extension of a line over into the Willamette Valley that is already apparently satisfactorily served by the rail transportation would permit us to secure any large part of that traffic. Mr. Magladry may be mistaken in his opinion. If the line were built across I don't think it would change to any great extent the present routes being used by these manufacturers, lumbermen manufacturers, in reach of eastern markets.

I don't recall whether the Herrick contract was accompanied by a bond to the Federal Government to the extent of some fifty thousand dollars to complete that operation.

1728 I think there was a contract between Herrick and the Oregon-Washington Railroad & Navigation Company to complete the mill and have it in operation and complete the railroad by April, 1925. If the operation were completed, there was no other railroad by which the traffic could possibly be routed. (3168.)

Cross-examination:

Q. (By Mr. ELLIS.) You have made comment in connection with several of your exhibits, Mr. Goodwin, to the effect that you believe existing routes of traffic would be used in preference to the cross-State line by reason of better service. What type of service did you have in mind in connection with the cross-State line in making those comments or comparisons?

A. Well, I believe it would probably be a mixed train service. It might be daily if the business would justify it, otherwise it may be every other day. It depends entirely on what the traffic will justify in the way of service.

Q. Isn't this in substance what your discussion or testimony amounts to on that, that you think the service would be poor because the traffic was light, and that the traffic would be light because the service was poor?

A. No; there will be no demand for any large amount of business to the San Francisco market to be moved over that cross-country line, and there naturally will be branch line construction, which won't permit as rapid service as available over main line. (3169.)

As to whether if the traffic would justify it you would give just as good service over the cross-State line as you would anywhere else over your system is a correct statement, it would dependent on the character of the traffic.

1729 You never give as good service on branch lines as you do on main lines.

Exam. ROGERS. Well, I think what Mr. Ellis is getting at is this, take the main line from Granger to Huntington, if you had service over that line three times a week, and mixed train service at that, you wouldn't have any traffic as compared with what you have now. Take the main line any way you want it, that is now enjoying heavy traffic, and if you reduce the service to service three times a week, and mixed train service at that, you wouldn't enjoy the traffic, would you? (3170.)

A. No; if you take the traffic away, but as long as that traffic is flowing the service will not be reduced.

Q. (By Mr. ELLIS.) And we might expect the same thing on the cross-State line if constructed, might we not, that if you had the traffic there you would give the service to take care of it?

A. If the traffic developed we would build up the service as it would justify it. The maintenance of that service would have a great deal to do with continuing the traffic movement via that route, if there is any traffic to move.

It is not a fact that the lean traffic moving via the Wells line at the present time is due largely to the fact that we are giving service only three times a week. I don't believe it has anything to do with the fact that traffic is being routed via the longer route. The service is more than adequate to take care of the small amount of business that is offered for shipment to San Francisco.

As to whether a large part of the traffic from the territory served by the Wells-Rogerson line is perishable traffic, where time is an important element (3171): There are a great number of
1730 potatoes raised there, and some apples, but they don't find their market in San Francisco, except to a very limited extent. Some potatoes go to San Francisco.

Exam. ROGERS. Are you speaking of bridge traffic?

Mr. ELLIS. Yes; more largely bridge traffic from——

We handle a few carloads of butter and eggs, dairy products, things of that kind; not so much livestock, 381 cars of livestock, I believe. Time in transit is an important element on all of those commodities. Good service is desirable. We give it to them; if there is any perishable freight in sight we hold the branch line train until the traffic arrives at Twin Falls and expedite it all possible.

Q. Well, as a matter of practical operation, when you have only three trains a week isn't it to be expected that your shippers to play safe will send it around on a route where they know the trains are operating every day?

A. Well, they may do that, yet on the other hand they may figure on the date that direct connection is made at Twin (3172) Falls and send their traffic so that it will make the connection without any delay at Twin Falls.

As to what extent the bridge traffic over the Wells line has been affected by the fact that our rate adjustment has not taken into account the shortened distance: The rate adjustment southwest of Minidoka does take that into consideration. From main line points west the rates are the same via both routes, but they are considerably lower from the Twin Falls district proper to San Francisco than the current rates via Ogden to San Francisco.

Q. Well, that doesn't entirely answer my question. Does that mean that in your opinion the rate adjustment has had nothing to do with the fact that the traffic has not been diverted to the shorter line?

1731 A. Well, there is practically no traffic moving from west of Mountain Home, Bliss, to San Francisco. The Idaho Public Utilities Commission has a complaint pending before the Interstate Commerce Commission at the present time covering that very point. That complaint is not a complaint from the shippers or the parties who paid the freight.

Q. Now, do I understand your testimony to be that the resources and (3173) traffic along the Rogerson-Wells line exceed those along the route of the cross-State line?

A. Well, I think there is perhaps a little more traffic there now, and prospect for an increased traffic in the local territory served by the Rogerson-Wells line that does not appear to be available on the cross-State line. The cross-State line will be about twice the length. In my opinion, the intermediate territory on the cross-State line will never produce any traffic.

Q. (By Mr. ELLIS.) What did you have along the route of the Rogerson-Wells cut-off in the way of traffic before your line was constructed? Was the mining development in operation at that time?

A. There was this big ranch. A lot of prospecting had been done. As to whether any more prospecting had been done at Contact, Nev., (3174) I couldn't say. They have shipped quite a number of cars of ore from Contact in 1927. They didn't ship any from Contact before the Wells-Rogerson line was built. There had been small quantities hauled to a loading point at Rogerson.

As to how the total volume of available tonnage at Contact compares with Alkali Lake: I don't know that there is any tonnage available at Alkali Lake. I only know what I have testified to about the Alkali Lake situation.

In making my statement, I did take into consideration that there was no tonnage available along the cross-State line. I
1732 think it is very doubtful whether there would be any commercial use for that material at Alkali Lake. I have not made any personal investigation to find out whether there will be.

As to the ranches along the Rogerson-Wells line: I didn't (3175) see any ranches of any consequence. As to the ranch 30 miles in extent: It is along our line. This ranch is owned by a very large concern, and they own approximately three hundred thousand acres of land and lease some 800,000 more, so they are close to the line clear from Wells north to a few miles from Rogerson.

Mr. ELLIS. As a matter of fact, the officials of your company have always contended that the mining operation at Contact was of no importance so far as traffic is concerned, have they not, and that it never would offer tonnage to justify the construction——

A. Mining operations are always doubtful. You can't determine except after a large amount of development work whether they will be tonnage producers or not.

It is my judgment that the cross-State line, if constructed, will be an inferior line in type of construction and in service to the Rogerson-Wells line, which is a very well constructed branch line.

Q. Well, do you know how it would compare in construction to the (3176) type of line for which an estimate of cost of construction has been introduced here by Witness Buck, which he designated, I believe, a first-class and substantially main line construction?

A. Well, if it is a main line construction it will be superior to the Rogerson-Wells line.

Q. Referring to your Exhibit No. 74, comparing distances via the several routes, the right-hand columns showing percentage
1733 of through distance to San Francisco, Calif., and segregating the distance on the Short Line from that of the Southern Pacific, can you tell me where the end of the Oregon Short Line would be under your assumption there of percentages; does that assume that the Oregon Short Line would build and operate the cross-State line to Crescent, or that the Oregon Short Line operation would end at Crane, or some other similar point?

A. It assumes that the Oregon Short Line might operate it under a lease from the Oregon-Washington Railroad & Navigation Company, the same as they handle the line from Crane to Burns.

Mr. ELLIS. The distance you operate would make a difference in this percentage, is what I was getting at, and I wanted to understand how this (3177) percentage was figured. That was figured on the whole through to Crescent Lake.

A. Yes, sir.

Q. Referring to your Exhibit 76, showing movement in northern California, to what extent, in your opinion, Mr. Godwin, has the movement to northern California points shown on that exhibit been influenced or affected by the circuity of haul in reaching northern California?

A. I don't think that circuity has anything to do with light shipments. That same situation exists with respect to Utah products, where there is no circuity. They don't find any substantial market in San Francisco.

To a limited extent there is a market in San Francisco and northern California territory for the products of southwestern Idaho.

Q. And you will admit, I assume, that to the extent that the cross-State line would shorten the distance from southwestern Idaho to northern California markets the possibility of the producers
1734 taking advantage of those markets and selling there would be increased, would it not?

A. I don't believe that shorter distance would increase the demand in San Francisco for western Idaho products.

As to whether it would increase or strengthen the opportunity of southwestern Idaho to compete with other territories that (3178) are now situated closer to San Francisco than are the southwestern

Idaho producers: I don't think that condition would be changed. The distance wouldn't be threatened sufficiently to offset the advantage of those other producing districts that supply San Francisco that are located much nearer to that market.

Q. But assuming that their competitors are, say two hundred miles closer than they are now, and the cross-State line puts them on an even basis, won't southwestern Idaho sell more of their products in northern California than they are selling now?

Mr. SPENCER. Well, that is an impossible assumption.

A. I can't answer that.

As to whether I have assumed in my conclusions with respect to that question that regardless of the shortening of distance there will be no reduction in rates: It is my opinion that the rates via cross-country lines from Ontario will be perhaps the same as the rate from Ontario to San Francisco via Wells. In view of the excessive new construction they might possibly be something higher.

Q. And that assumption has been kept in mind in drawing your conclusions as to what benefits would accrue to southwestern Idaho, as to what traffic would move?

A. No; my conclusions are based somewhat on the fact that San Francisco is perhaps the most nearly self-supporting of any (3179) Pacific coast market we have, and they will not to any great extent purchase in large volume Idaho products.

1735 Q. Well, are they not purchasing products more distant than southwestern Idaho at the present time?

A. I couldn't say as to that.

Q. (By Mr. MCCULLOCH.) Mr. Godwin, why does the Short Line operate the Oregon eastern branch for the account of the Oregon-Washington Railroad & Navigation Company, or do you know?

A. I couldn't answer that question. I presume it is largely because it was disconnected from the Oregon-Washington Railroad & Navigation Company unit. It has operated them for the account of the Oregon-Washington Railroad & Navigation Company, as long as the Oregon eastern branch lines have been constructed.

The Oregon Short line has no interest in the Burns-Seneca line. Neither has the Oregon-Washington Railroad & Navigation Company.

Referring to the map, Exhibit 73, if traffic from Nampa or Caldwell or Payette to San Francisco should be (3180) routed via Wells, it would move east of Bliss to Minidoka; then down through Rupert and Burley and Twin Falls and Rogerson and Wells. And the distances shown in Exhibit 74 via Wells and via Ogden and via Crescent Lake and via Portland contemplate that routing that I have just described, so far as the route via Wells is concerned. That is the way the traffic is handled.

The branch lines shown on Exhibit 13 were usually constructed slightly in advance of full settlement of those lands and colonization. So that (3181) the people who settled those lands as soon as water was available, had transportation facilities to get their products out

to market. Those lines were built, however, with the full assurance that there was water available to irrigate the lands that were proposed to put under cultivation.

Q. Mr. Godwin, was the Rogerson-Wells branch constructed by the Oregon Short Line with the idea that it would be from the beginning and for all time to come self-sustaining, without the
1736 traffic that would move over it as a bridge line?

A. No; I don't think it was ever contemplated to for several years to be self-sustaining from local traffic that might develop along the line. It was hoped that the line would be self-sustaining without considering its use as a branch line for traffic from southern Idaho to California markets, but that all depended on future development.

Q. Well, I suppose you hope that, don't you, about every branch line and division or section of your railroad—you would like to see it self-sustaining—but, as a matter of fact, Mr. Godwin, are all of the branches of the Oregon Short Line self-sustaining? That is, if you would just simply take (3182) the traffic originated on them or delivered to points on them?

A. No; they are not all self-sustaining.

Mr. McCulloch. I had in mind the testimony of the auditor. I didn't want to cover ground that the auditor has testified on.

Redirect examination:

In my statement I discussed the difficulty of the valleys around Ogden and Salt Lake reaching or finding a market in San Francisco. Those exhibits won't show the comparative movement of the tonnage from Utah Valleys there to San Francisco and Los Angeles.

Q. Well, do you know from your intimate relations with the local (3183) situation whether the volume of tonnage from the large valleys you describe in Utah greatly preponderates to one section or the other—I mean northern California or southern California?

1737 A. The large volume moves to southern California, and in a nominal quantity to San Francisco Bay points. Distances are practically the same. No great variation.

Mr. Spencer. I want to know the comparative distance from the points of origin there at Salt Lake and Ogden to San Francisco via the Central Pacific on the one hand and to Los Angeles via the Union Pacific line, the Los Angeles & Salt Lake Railroad, on the other.

A. The distance from Salt Lake to San Francisco is 818 miles; from Ogden to San Francisco, 782 miles. From Ogden to Los Angeles it is 818 miles; from Salt Lake, 782 miles. The rates are the same to both destinations. (3185.)

My point is that although the distances are the same, about, to San Francisco and Los Angeles, the preponderating movement is to Los Angeles. The market is there. San Francisco is not an extensive market for those products that are raised in those valleys.

They are the same kind of products that are raised over in southern Idaho.

[File endorsement omitted.]

1738 PORTLAND, OREGON, *Tuesday, August 21, 1928.*

E. STACY was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am a civil engineer in the employ of the Oregon Short Line Railroad Company, with 26 years' experience, 23 of them with the Oregon Short Line.

My duties have been and are broad in scope and include, among other things, location and relocation of lines, the making of estimates for proposed construction work generally, the supervising of portions of construction work undertaken, and the investigation of territories not immediately served by the lines of railroad with which I am connected; this with a view of determining traffic possibilities and the feasibilty (3187) of railroad construction in the same. This work, involving investigation, study, and report, has been special and confidential in character but extensive and has covered large territories during the past 15 years.

I have been over in the eastern end of this central Oregon country. During part of 1906 and 1907 I was engaged in some of the extensive surveying that was prosecuted in the central Oregon territory and have been over the major part of it, and am familiar with it particularly the location of the cross-State line proposed in this case. On the early morning of July 20, 1928, I left Burns to go over this line again and traversed the country along the route indicated in parallel black lines on the map marked Exhibit 3. Proceeding from Burns southerly to the location of the proposed cross-State line nearly opposite the Narrows, near milepost 140 of the railroad
1739 on the map referred to. The (3188) miles in the route traversed by me are indicated on the map progressively each 10 miles.

After proceeding about 10 miles south from Burns on this route, I encountered desert and unproductive land to milepost 30 on the map. Then proceeding westerly from milepost 30 to the OO Ranch at milepost 44, the land traversed consisted of unproductive areas entirely impossible of reclamation and cultivation. The margin along Harney Lake for several miles is thoroughly impregnated with alkali and will permit of no crop, growth, or cultivation. This so-called lake is now nearly dry.

Proceeding westerly from the Harney Lake area to the OO Ranch, the country traversed is largely of clay and hardpan formation, with some growth of greasewood and salt grass in the lower levels. None of it can be profitably reclaimed.

Upon arriving at the so-called OO Ranch, milepost 44, we found perhaps 600 or 700 acres of grass land that was devoted to the raising of wild hay, sustained by a spring. The volume of water, however,

is not large and increased acreage production at this locality is not possible to any substantial extent.

Proceeding westerly from the OO Ranch we arrived at the so-called Big Stick Creek, a dry creek near milepost 50. The country traversed is unproductive and forbidding, and consists of greasewood and salt grass flats. Here, at mile (3189) post 50, the projected line enters the Big Stick Canyon country and proceeds up same to the Wagontire Mountain, a distance of approximately 20 miles. The formation is largely lava rock; the canyon is dry and there is no living water.

1740 Construction along this route will be necessarily expensive, because of the heavy cost involved in moving lava rock. This cost will not be less than $2.00 per cubic yard, and the yardage is considerable.

I have had considerable experience in construction work where this so-called lava rock is encountered. In our Idaho country that is all we do have. I have had recent experiences. We are building every year some additional trackage amounting on an average to one or two millions a year worth of work, and it is all in the lava rock country.

Our prices for lava rock varied from $1.90 a yard to $2.12. A good deal of that has been adjacent to the present main line, where transportation was within a few hundred feet and (3190) everything was favorable, at least, or more favorable, in fact, than this central Oregon country, for getting the equipment in to do the work with and so on; also where there wasn't any water available along on some of this work water could easily be obtained from railroad tank cars spurred out there within a few feet of the work, and all of that, of course, would be a convenience that the contractor would not enjoy out here in central Oregon.

I think Mr. Buck made an allowance or estimate of $1.30 a yard straight for solid rock in his estimate. That is entirely too low for lava rock. We ask for bids from all the principal contractors and the bids are always consistently $2.00 or more.

Proceeding westerly from the summit of Wagontire Mountain near milepost 70, being milepost 170 on the proposed railroad location, we arrived at the extreme easterly end of the so-called Christmas Lake Valley. This takes us to milepost 100 on the route traversed by me.

1741 The territory covered consists of rough lava rock formation, with some inferior sagebrush. The work on this stretch is heavy and will be expensive because of the difficulty encountered in moving lava rock. (3191.)

Leaving milepost 100 we proceeded to Lake at milepost 129. The country traversed in this last stretch is a flat dry valley. There is no living water and large stretches of hardpan for the entire distance.

Lake is a little store and post office in a desert. Only 10 families get mail at this post office. The party in charge records precipitation and weather conditions for the United States Weather Bureau, and

from this source the annual precipitation was found to have been only 6 to 7 inches during the past several years. There was no evidence of any cultivated crop as far as one could see. We asked the woman in charge whether any crops were raised in the neighborhood, and she answered that it was impossible to raise crops because of the lack of water, and because, as she stated, "what the frosts did not get the jackrabbits did."

To the north from Lake is the so-called Christmas Lake, but same has been dry for the past ten years.

Proceeding from Lake to Fort Rock at milepost 162½, we traversed innumerable sand ridges and a general desert country. Fort Rock is in the west end of the Christmas Lake Valley. The proposed irrigation district there has, I am informed, been abandoned and the district dissolved on account of not being able to get any water.

There is a small irrigated ranch of approximately 60 acres sustained by a well operated by a gasoline engine near (3192) milepost 155, at a point some 7 miles more or less from Fort Rock. This is known as the John Ernst Ranch.

1742 I have had considerable experience in connection with irrigation problems over the past 20 years, and have yet to see an instance wherein production on a large scale by pumping has been successful. The nearest approach to success has been along Snake River on the Idaho-Oregon boundary in the Owyhee district, where the waters of Snake River have been elevated a distance of from 40 to 100 feet and perhaps higher in some instances, but in that location along Snake River the soil is of great depth and fertility, consisting in the main of a sandy loam. It is extensive in area and the pumping operations were conducted to an extent that some 40,000 acres were reclaimed, but the pumping operations were installed and progressed under a system operated by electricity obtained from the Idaho Power Company installed years ago when the rates for the service were low.

Later the rates were increased and the burden on the grower was so great that even with the rich country served, the grower was unable to stand the charge, and this condition was the principal inducement that brought about the action of the Government in undertaking the construction of the Owyhee Dam, which has now been undertaken.

When this is accomplished, the gravity supply of water will relieve the excessively burdensome charges for pumping (3193) now sustained.

In his testimony with respect to this district, Mr. Teutsch stated that the production would increase 25 per cent, when the gravity water was obtained. Such, or any substantial increase will, in our opinion, be impossible, the fact being that this land, which has been served by pumping operations, has had an unlimited supply of water from Snake River from the beginning, and it has been used.

1743 In this Owyhee district, too, the grower is favored with an elevation of about 2,000 to 2,300 feet, permitting of the

growing with security and confidence of a great variety of crops, including fruit, forage, grain, potatoes, vegetables and the like. At Fort Rock, however, in the Christmas Lake Valley, is an exposed and unprotected country at an elevation of about 4,200 feet.

In their report, published in October, 1915, by the Department of the Interior, United States Reclamation Service, in cooperation with the State of Oregon, on Silver Lake project irrigation and drainage, Engineers John T. Whistler, engineer United States Reclamation Service, and John H. Lewis, State engineer for Oregon, published tables, pages 34 to 39, inclusive, on frost data and temperatures as taken at Silver Lake, located some 20 or 25 miles south of Christmas Lake and also at Cliff on the north side of the Christmas Lake Valley, wherein they regard frosts registering 26 degrees Fahrenheit and below (3194) as a killing frost.

The years embraced in these tables cover the period from 1907 to 1915, inclusive, and show that during the month of April the average number of days with a temperature 26 degrees and below was 15 at Silver Lake and 18 at Cliff. During the month of May the average number of days for the 9 years involved was 7.3 days at Silver Lake with killing frosts 26 degrees and below and 12.8 days at Cliff. During the month of June the average at Silver Lake was .7 of a day, while at Cliff the average was 5 days. During the month of July the average number of days of killing frost 26 degrees and below was .14 at Silver Lake and .75 at Cliff; but even in July, according to the tables for that month, there were 1.8 days at Silver Lake when the thermometer was 32 degrees and below; while at Cliff there were 5.5 days 32 degrees and below.

1744 In August there was an average of one day during that month over the period of 9 years with a temperature of 26 degrees and below at Silver Lake, and 3.41 days at Cliff when it was 26 degrees and below, but during August there was an average of 6 days over the 9 year period during that month when the temperature was 32 degrees and below at Silver Lake and 11.4 days when it was 32 degrees and below at Cliff.

In September the average for the 9 year period was 6 days with a temperature 26 degrees and below at Silver Lake, and 13.7 days when it was 26 degrees and below at Cliff. (3195.)

While there are considerable areas of soil in the western end of the Christmas Lake Valley in the Fort Rock district that would raise crops if an adequate water supply could be obtained, this is not the case from the middle of the valley to its eastern end, a distance of probably 20 miles or more. In this stretch of the valley productive land does not obtain. Commencing with the east end of the valley and proceeding for 15 miles until we reach Lake, the soil is hardpan and grows nothing to speak of except greasewood. From Lake for a distance of 7 or 8, perhaps 10, miles toward Fort Rock are loose sand ridges with some salt grass growing in between them.

Then on to Fort Rock and the west end of the valley for a distance of probably 15 miles the soil is better and with productive possibili-

ties if climatic conditions permitted and if an adequate water supply could be obtained. Over this district there is a considerable growth of rye grass, upon which cattle and livestock can subsist.

Statement has been made that this area can be dry farmed because of the presence of the Russian thistle. According to my observation there is little growth of thistle in the Fort Rock Valley, but if
1745 it exists it is certainly no indication that the land can be successfully dry farmed. We have thousands of acres of abandoned dry farmed areas adjoining our rights of way in southern Idaho and in Utah (3196) where dry farming has been unsuccessfully attempted and the undertaking abandoned, but the country is almost covered with this pest.

On the question of sinking wells for water in this Fort Rock area, I am reminded by the conditions there obtaining of a district at Beryl in southern Utah. While the Beryl district is better than this from a standpoint of climatic conditions because of the much warmer temperature for longer periods, yet it has entirely inadequate rainfall for successful dry farming. It is, however, adjacent to the main line of the Los Angeles & Salt Lake Railroad Company, and if production in volume could be accomplished would enjoy the Los Angeles market.

There is a large subterranean water supply under the lands in this Beryl district, and during the past 5 or 6 years about 25 wells have been sunk to obtain water for irrigation purposes. These wells range in depth from 15 to 400 feet and the settlers upon the lands have been able to raise some alfalfa, but as yet no farm products to speak of have been shipped from the district and it cannot be said that it is a dependable district for agriculture from developments that have taken place to date.

There are other districts on the Los Angeles & Salt Lake Railroad near Cedar City, Enterprise, and Parewan, where irrigation by pumping has been carried on in a more or less ineffective (3197) way for several years and some considerable alfalfa has been grown, but the districts have not proven a success and the acreage cultivated is small and does not increase. Gasoline engines are used for pumping in the Beryl district and electric power is used in the other districts mentioned.

1746 We left Burns at 6.30 in the morning and arrived at Fort Rock shortly after 4 o'clock in the afternoon, and for the entire distance we did not encounter a single person, automobile, or other vehicle on the road.

In nearly all unsettled areas in these semi-arid districts in Idaho and Oregon the presence of considerable bands of wild horses generally obtains, if grazing is possible and any living water is to be found. Along this route no wild horses were to be seen.

Fort Rock consists of a settlement of perhaps 25 or 30 people. The only other settlement encountered in our journey from Burns was a farm house at the OO Ranch, and three settlers in the neighborhood of the Hutton Ranch at the base of Wagontire Mountain. The only cattle seen along the route were some 30 or 40 at the Hutton

Ranch, and some 8 or 10 cows at the OO Rranch. There undoubtedly is some little additional livestock at some of these ranches or connected with them, but the number must necessarily be very small because there is very little possible way of raising forage for them.

Fort Rock along the route of line was reached by traveling (3198) over trails evidently made by dry farmers who have long since left the country.

At Fort Rock we reached the so-called Bend-Lakeview road and proceeded up to Lapine, entering the Deschutes National Forest at milepost 171. The distance traversed was 40 miles. Some 16 or 17 miles of this distance is through the Deschutes National Forest, and about 14 or 15 miles through timber lands privately owned. Of all the entire stand of timber not more than one-third of it is suitable for manufacture of merchantable lumber, and the stand is light. The remaining two-thirds consists largely of black pine, commonly known as lodge pine, and suitable only for manufacture of railroad ties. (3199.)

1747 Lapine consists of a settlement of perhaps 100 people. We stopped here for the night and the next day proceeded to Crescent (formerly Odell), thence to Umli and thence to Crescent Lake. The settlement at Crescent consists of perhaps 35 or 40 people. At Umli, a settlement of section hands for the railroad consisting of perhaps 6 or 7 people, and at Crescent Lake perhaps 40 or 50 people, largely employees of the Southern Pacific Company.

Crescent Lake is a freight division point on the Southern Pacific Railroad. The improvements there consist of a two-stall frame enginehouse, frame depot, a two-story frame clubhouse containing 50 or 60 sleeping rooms for railroad employees, and a wye track.

There are some 6 or 7 feet of snow in the winter season at Crescent Lake, and we are informed that two rotary snow plows work there constantly during the winter season.

From Crescent Lake we returned to Crescent, and thence drove over to Bend, making 316 miles to this point. In the morning we drove from Bend to Burns, as indicated upon the map.

After proceeding east from Bend, a distance of perhaps 8 or 9 miles, we again encountered the desert country, and with the exception of a store and post office at Millican at milepost 345, and an eating-house and gasoline station at Halfway, at milepost 385½, and a store and post office at Suntex, there was no production, industry or settlement along the entire (3200) route from Bend to Burns until within 10 or 12 miles of Burns.

Near the old post office at Riley we crossed Silver Creek. This is the watercourse which is supposed to support an irrigation project of some 16,000 or 18,000 acres, but it was absolutely dry, and it had the appearance of having been dry for a considerable period

1748 of time. Its bed and banks were cracked, and no evidence of moisture obtained.

The territory traveled from the Double-O Ranch to the Des Chutes River does not afford sufficient water for irrigation purposes or to permit of settlement, the conditions rendering crop production impossible, even if the land were fertile, which generally it is not; and a substantially like condition obtains from a point 8 or 9 miles east of Bend until the Silver Creek drainage is reached at milepost 430.

I have reviewed the estimates of the proposed line that have been introduced in evidence and consider them low because of the very large amount of lava rock that must be moved, and because there are not available camp sites with water for the accommodation of contractors.

For the greater part of the distance along the route traversed there are no good roads and the contractor will experience much expense and difficulty in hauling supplies, machinery, and water.

My experience in the removal of lava rock has been extensive, and has extended over many years. We have found no way as (3201) yet to move it in large volume by explosion. It is penetrated with seams and crevasses through which the explosive escapes without moving it in large volume and breaking it up.

I have just recently completed the installation of 12 miles of additional main-line track between Shoshone and Minidoka, Idaho, wherein the grading qualities were comparable to large sections of this proposed line, and the 12 miles of track built with transportation advantages and main line adjoining, cost $90,000.00 a mile.

It cannot be moved in this central Oregon country, in my opinion, for less than $2.00 a yard. In fact, I was compelled to pay $2.12 a yard for the removal of some of it in the
1749 double-track construction to which I have just referred.

I have, therefore, made my own estimate on the cost of the construction of the proposed line after a review of the territory and a re-checking of the profiles, and in my opinion it will cost $11,294,645, or $61,052 per mile for the 185 miles involved. My construction contemplates 90-pound rail and creosoted ties. My detail of estimate is submitted herewith.

(Said estimate was thereupon received in evidence, marked "Defendant's Exhibit No. 81, Witness Stacey.") (3202.)

In my estimate of the cost of construction I used one-half ballast section as compared with Mr. Buck's full-ballast section. My estimate runs into more money. Mr. Buck was too low on his lava rock.

Q. Now, the question was asked yesterday or day before by the commissioner as to why there was so much frost there in the Fort Rock Valley, or in the west end of the Christmas Lake Valley, when the elevation was not as high as other elevations where less frost seemingly obtained. Did you make any inquiry as to that particular question or problem when you were on this trip?

A. Yes; the night we stopped at Lapine I was talking to an old gentleman in the restaurant there, and he said the night before we came was the first night they hadn't had frost at Lapine this

summer—we stopped there on the night of July 20th, this year—and I asked him why they had frost there so frequently in the summer, and he says, "Every night, especially around two or three o'clock in the morning, there is a breeze springs up from the direction of Three Sisters, and that brings the cold wind from
1750 those snow-covered mountains." That is the principal reason for the cold nights and frost in that country. (3203.)

The Three Sisters are located west of Bend, I think, and north and west, I think, of Lapine and Odell. They were pretty well covered with snow when we were there in July. Those so-called Three Sisters are very high mountains. They are high enough to be covered with snow in the summer time. I don't know the elevation of them. I have seen them; they were very well covered at the time we were there, and the old gentleman said the snow stayed on them all summer. The significance I attach to the fact that there is snow on them all summer is that it means it is colder up there than if snow wasn't there. In 1907 also I was down in the Pitt River country in California 30 or 40 miles from Mt. Shasta at an elevation of about 3,000 feet, in early August; the days were quite warm and every time we got the wind from Mt. Shasta we got a frost that night. From my experience and observation a desert country is peculiar as to frost at night. (3204.) A desert always cools off more rapidly at night than any other country, and the dryer the air the more rapidly it seems to cool off for some reason. That has been my experience of it in this inter-mountain country.

Q. Now, this country in central Oregon that is described as the high desert, does that end at the Nevada line or the California line? Just relate your experience and surveys and reconnaissances that you have made on south. How extensive is this desert area?

A. I have covered the country pretty well from Harney Valley to Reno, Nevada, from Caldwell to the Jordan Valley, the McDermitt country, and the Pudding River, to Winnemucca, from Twin Falls to Cobre, Nevada, and also from Twin Falls to Wells,
1751 Nevada, and before the separation of the railroads I was on grade reduction on a line which is along what is now the Central Pacific from Elko to Lucin Junction, and got, I think, a pretty well defined idea of the northern Nevada country.

The northern Nevada country, the northern Nevada desert, is very similar to this central Oregon. In fact, the central Oregon country is a continuation of that Nevada desert.

There was no place in my travels in Nevada, which was done by team, where I didn't get water every night, making thirty or forty miles a day, and stock water, living water, was more frequently obtained than in this trip across central Oregon (3204) along the proposed cross-State line.

After leaving the springs on Wagontire Mountain we encountered no natural living water until we hit the Deschutes River, a distance of about 90 or 100 miles.

I made surveys from this Oregon country down across the northern Nevada country. I ran a line from this proposed cross-State line out, leaving west of the Double-O ranch some 8 or 10 miles, and I ran that line down some 250 miles south into Nevada, and later got orders to abandon it. I spent about 4 or 5 months in that. I did that in the spring of 1907. In leaving the Double-O country there is a spring just back of Iron Mountain there, then it was 30 miles to the next spring, called Mule Springs, which went dry in the summer, and then another 30 miles before we reached the Warner Lake country, so that in the summer time there would be a distance in there of 60 miles between water holes. The country off to the south there is similar in all respects to this cross-State line, a large desert without any settlement, sage brush on the benches, greasewood in the bottoms of the valleys. (3205.)

1752 I didn't have direct charge of the construction of the Rogerson-Wells line. I revised the location in 1913 into Cobre, and in 1923 I had charge of the location of the line to Wells from Rogerson, prepared the estimates and the construction profiles and I was over it frequently. I went over it after it was constructed and criticized it. The character of the construction of that line was what we call medium good branch line construction. We used 90-pound rail. It is better than our main line was 25 years ago, has heavier steel, better all-around construction. The character of the country traversed as compared with the cross-State line, as to productive capacity is as follows: In leaving Rogerson and going to Wells living water is encountered every 8 or 9 miles along the entire route, and for a good deal of the distance we followed the Salmon River, which is composed of valleys, meadows, ranches, (3206) owned for the most part by the Utah Construction Company. They have 8 ranches, I think, directly along that railroad, and out through other localities more or less distant they have about 20 more.

As to how many ranches there are tributary to it that are producing ranches, that is, that raise any product for transportation, they have, I think, 27 ranches all told, all of which are more or less tributary to this line.

Q. Now, you speak of a ranch—are you discussing that as an irrigated, diversified ranch, or what kind of a ranch? Give us some idea of the way it is operated and the extent of it and what they produce.

A. The hay is for the most part the natural native hay, very similar to that operation now in the Harney Valley along the Silvies River. The hay is mostly fed to the cattle——

1753 Q. Well, how is it produced?

A. By irrigation.

Q. What kind of irrigation?

A. Some of their ranches have a system of ditches, some of them use the flooding system almost entirely, similar to the Silvies River.

Some of those ranches cut several hundred tons of native hay, and some of them cut several thousand. It is a sufficient operation to sustain their livestock industry, which before they went into the sheep business (3207) sustained about 40,000 head of cattle. I think——

Q. Is that more cattle than they have got in all the Harney Valley?

A. I think it is about as much. I forget the exact number testified to, but substantially the same as in Harney County.

That is, as these traffic optimists have pictured in Harney County. The total hay land in those ranches would be in the neighborhood of from 40,000 to 45,000 acres. Their grazing lands probably cover 2 or 3 million acres all told. They own outright 3 or 4 hundred thousand, and they lease, I think, almost a million from the Southern Pacific Company, then they have a lot of Government range land in addition.

Exam. ROGERS. Mr. Stacey, how did you arrive at the conclusion as to how many cattle there were in Harney County?

A. I think I got my information from my memory in regard to the testimony that has been presented at this hearing. (3208.)

Exam. ROGERS. Have you analyzed the testimony that has been presented here?

1754 A. No; I just took his statements of it.

Exam. ROGERS. Can you remember all the testimony that has been presented here as to cattle in Harney County?

A. I remember the statement of that one witness. That witness was Mr. Duncan. I remember him saying that he estimated 50,000 head of cattle in Harney County. I did not look at the assessment roll there and see what there was. (3209.)

As to whether there are any roads through this central Oregon country along this line of survey for 20 or 30 miles on either side of it except the road from Bend to Burns, there are not; outside of a few stretches on the Bend-Burns line, there is the original sagebrush trail that was made in the early days, and the rainfall is very light, so they don't get washed out very much, so there is just the natural trail across the country, very crooked, most of it.

Cross-examination:

I went over this line late in July of this year, leaving Burns July 20th. (3210.) That is not the driest season of the year in the desert country when you expect to find conditions at their worst. I think it gets drier a little later in the summer than that, that is, in August or the first part of September, the ground gets drier than it does in July. It does not get very much drier in August than it does in the latter part of July; it can't get much drier. And if the water holes are going to be dry any time in the season, you will find them in July and August, and September.

In making the trip I observed stands of sagebrush at numerous places across the country, but I would not call them heavy

1755 stands of sagebrush. I certainly did not find sagebrush that look almost like trees. It all looked about knee-high.

Q. Didn't find any sagebrush that was 6 or 7 feet high (3211) and 6 inches through at the base, or nearly that?

A. Nothing like that. I saw in the bottom of some of the washes where moisture was—where the ground was a little more moist and looser than the benches, sagebrush, probably a few sticks of it 5 or 6 feet high, maybe 3 or 4 inches through at the bottom.

Beginning at milepost 10, and from there to milepost 30, is a desert section. After you cross the Silvies River there and get out of the hay bottoms you are in the desert. That area between mileposts 10 and 30 is not pretty well settled up with people living all along the road there; we saw 2 or 3 empty houses, none of them occupied. The road at that joint crosses a high point called Wright's Point that projects out into the valley.

Q. Then at milepost 30 the road drops down towards Harney Lake, where there is rather a low, level stretch of land for some distance, that is now being used for raising hay?

A. I didn't see any hay there.

Q. Didn't you find that section of the country settled, a number of ranchers living along through there? (3212.)

A. We saw—after we left the Silvies Valley we saw no inhabitants until we drove into Mr. Hanley's Double-O ranch.

Q. That is for what distance?

A. Mr. Hanley's ranch, I think, was at milepost 44, on the speedometer.

1756 Q. And the distance to his nearest neighbor towards Burns is how far, did you say?

A. Along the route that we travelled after—we left the Silvies hay fields probably at milepost 10, and the next inhabitant in the county was Mr. Hanley's ranch at 44; that would make a distance of 34 miles.

Q. Do you know whether there are ranchers living in that territory and around Harney Lake, or is it your testimony that Mr. Hanley's Double-O ranch is the only ranch that is occupied in that territory?

A. There is another ranch house down below Mr. Hanley's ranch a couple of miles that used to be occupied in 1907. We didn't drive over to it to see or not. It is a small ranch compared with Mr. Hanley's.

Q. Have you made any survey away from the road that you say you traversed and around Harney Lake, on the south shore, to what extent that country is settled and producing crops?

A. You mean the Blitzen Valley?

Q. No; the section around Harney Lake, around the shores of the lake? (3213.)

A. I have driven around the south side of the lake in 1907, but we didn't go that route this trip.

Q. And you don't know to what extent that country has been settled up since 1907, from your own investigation?

A. Adjoining the lake there we could see across the lake into the other side from our route travelled. We didn't look very far into

the country. In fact, I remember one or two buildings over there. Whether they were occupied or not I don't know, that is, outside of the Narrows store.

1757 Exam. ROGERS. Mr. Stacey, I think if I were coming across that what I could see from the road wouldn't be any guide as to what there was there. Do you agree with that?

A. Well, the route we travelled, of course, was on one side, and then on the other, more or less, and I think we could see several miles each side. There was no indication of any travelled road leading out in any direction, either way. (3214.)

I haven't made any trip around the south shore of Malheur or Harney Lakes since 1907. I could see across there on this trip, however. Nor have I made any trip down into the Blitzen Valley. Then west of the Double-O ranch, no settlers were found until Wagontire Mountain is reached. There were 3 ranches that we could see on the side of the mountain—the 2 Hutton ranches, and the Wagontire post office, 2 or 3 patches of rye hay upon the hillsides, a little native meadow hay where there were little springs at 2 places, I think. Now, those ranchers have been living there for quite

1758 a number of years. The Huttons and the Egley ranch, I think, were there long before any railroad survey. I understand they were.

Q. And they have good wells and raise all the grain they need for their livestock, all the feed they can use for their livestock?

A. Well, the operation there, of course, is very limited as (3215) regards hay. They no doubt run cattle along the mountain there for what winter feed they can grow.

Q. Now, between the Wagontire and the Double-O there is quite an area of low, marshy land where good grazing exists, is there not?

A. From the Double-O ranch to the Big Stick Canyon country is 8 or 9 miles. Those flats are salt grass, some alkali. The grazing possibilities are very poor.

Q. Well, you always find a great many cattle grazing in that vicinity, don't you?

A. Not on salt grass.

Q. Well, the cattle are running in quite large numbers west of the Double-O ranch and between there and Iron Mountain?

A. The sagebrush bench country up above those salt-grass flats had a very scanty growth of grass until you got up on the slope of Wagontire Mountain.

Q. Then between Wagontire and Lake and Christmas Lake Valley your description of that was to the effect it was very rough country, with greasewood and sagebrush?

A. Not greasewood up on the mountains—sagebrush.

Q. And you find your next settlement at Lake. Are they doing any farming, dry farming, there at the present time?

A. None that we could see, and the postmistress advised us that there wasn't any. (3216.)

1759 Q. They run some cattle, though, on the ranges, don't they, in that vicinity?

A. They have a few extra cattle around there; I know that I saw a cow in a corral there with a little pile of hay alongside of it.

And across at Fort Rock we found a crop being raised by pumping irrigation, on the John Ernst ranch. That is the only ranch we visited. We did not visit the Parks ranch. The John Ernst ranch was the only green spot on the valley. He had a ranch there with approximately 60 acres, I would say, pumping water by gasoline engine from a well. He had an alfalfa field and I believe some grain. That is not all I saw him produce; he had a little garden patch alongside of his house and I think he had a few cabbages there; a few potatoes, if I am not mistaken. (3217.)

Q. Now leaving the Fort Rock Valley, you got into the timbered area, and I believe you stated that the timber was of poor quality; just how much territory do you take in when you estimate that the timber was of poor quality?

A. I take in just what I saw.

Q. Just what you saw in traversing the highway?

A. In going through from Fort Rock to LaPine, LaPine to Odell, Odell to Umli, Umli to Crescent, and Crescent to Crescent Lake, and from Crescent Lake back to Crescent via another route.

Q. Do you think you saw the better stands of timber in traversing that route?

A. I think I got a fairly good idea of the territory that would be traversed by this cross-State line.

1760 Q. Well, as a matter of fact, you find the better grades of timber at certain levels and you have to follow around the ridges to find the good timber, do you not?

A. Well, we crossed over the Walker Mountains and down again. It all appeared very much the same. I didn't notice any substantial difference at varying elevations.

Q. You didn't make any investigation at any points off the line that you say you traversed for the purpose of making this report; you didn't go either north or south of the line?

A. Well, we were at LaPine, which is some 30 miles north of where the cross-State line would be.

Q. Well, is it not often true, Mr. Stacey, that a line of (3218) railroad is constructed through the worst section of the country and that you will find both to the north and south of it fertile and more productive lands?

A. Yes; in places that is true.

Q. Well, that is a general rule, to get a practical line the survey will hold to the lowest—where they can get the lowest grades and keep a common level, as much as possible, and that it takes you away from the better class of land?

A. No desert land is much good unless you can get water on it.

Q. But, as a matter of fact, the location of the line of railroad itself, your survey, is not affected by the question of fertility of soil

at all; it is affected more largely by where you can get the best line and you will expect the product to get to the line in some way?

A. Oh, yes; the country is all a range country.

1761 Q. You spoke of the Teutsch report on the Owyhee and questioned Mr. Teutsch's estimate of a 25 per cent increase as soon as the gravity supply of water was obtained, and at the same time stated that irrigation by pumping had not been a success. I am wondering how you can justify the two statements.

A. The raising of crops under pumping is a success, but the financial side of it was not a success.

Q. Well, have they been utilizing the district under pumping to a full 100 per cent capacity?

A. As much as the average irrigation project. (3219.)

Q. And regardless of whether it has been a financial success under pumping, you think they have been operating their lands to 100 per cent capacity?

A. As much as the average irrigation project operates it.

And in my judgment there would be no increase in that production to be expected through furnishing a gravity supply. That does not prove to me that the pumping operation was fairly satisfactory to the farmers. Pumping charges were more than they could bear. That was the main argument that was used to induce the Government to build the Owyhee Dam, was to rid the farmers of those pumping charges. But they have continued to pay them and to farm their land to 100 per cent capacity. That is better than abandoning it.

Q. In connection with this 12 miles of main line, which I think you said was double-tracked, where you paid the $2.12 for lava rock excavation, would you say to what extent that price was affected by the fact that it was double-track construction and the work had to be carried on so as not to interfere with main-line trains?

1762 A. Very little of that interference. We paid $2.00 a yard on the Rogerson-Wells for lava rock, which is away from any present tracks. (3220.)

That is a factor to be considered in removing rock. It also has its compensating advantages, though, being close to transportation. However, this track, this certain stretch here that I mentioned, was far enough away so there was practically no danger of blasting rocks on the present track. We moved the telephone line, the Western Union Telegraph line, over to the other side of the right of way, and they had a clear field.

As to whether we had very much of this lava rock construction on the Rogerson-Wells line, it was lava rock so far as Shoshone Creek, which was over in Nevada just about 7 or 8 miles. There were probably 30 miles of lava rock. In spite of our 30 miles of lava rock, our actual cost of construction on that line was far less than I have estimated here per mile for the cross-State line. The cost per mile of the Rogerson-Wells line was approximately $40,000, and I am estimating $61,000 for the cross-State line. (3221.) As to wherein the conditions are sufficiently different on the cross-State

line to justify a difference of $20,000 per mile, because the major portion of the rock excavation on the Rogerson-Wells was south of the lava rock section, and that was, I believe, $1 or $1.05 per yard. We had very considerably smaller grading quantities per mile on the Rogerson-Wells line than on this cross-State line.

As to whether I think the presence of wild horses is indication of fertility of the area, or the fact that there is good grazing
1763 there, it is a sign that the country is not used very much or the wild horses would not be there. The significance of my statement that I saw no wild horses on the entire trip is that it indicated to me that it was a very dry country, a long ways to water holes.

Q. (By Mr. ELLIS.) Well, don't you know, as a matter of fact, Mr. Stacey, that that country has been overrun with wild horses to such an extent that cattle and sheep men have been up in arms over it, have been instrumental in starting horse meat canneries and fertilizer factories to get rid of them? (3222.)

A. Yes; indeed. I found lots of them out there in 1907, but I always found them within reasonable distance of water holes.

I am certain I saw no wild horses on this particular trip that I made across. If wild horses are being gathered up in order to preserve the feed, if they have cleaned the country out of wild horses, the fact that I saw none on the trip would practically have no significance. But if they had not, it is an indication that it is a long ways to water holes. I do not know what the fact is, whether they have cleaned it out or not.

In my Exhibit 81 is an item of $291,000, for freight and fares. The material items included in the freight portion of that account are contractors' machinery and supplies. It is a general all-embracive figure that includes all items of construction cost wherein freight is involved—all contractors' stuff that is necessary to build the (3223) railroad. It is true that later on, under the heading rails, I have another allowance for transportation; that covers hauling the rails.

1764 Q. Then this $291,000 is freight on everything except rails?

A. The contractor never lays the track; we lay the track. The contractor builds the roadbed.

As to whether it is customary to use first grade creosoted cross ties in a country such as this line will traverse, it will be, I will say, in the next 2 or 3 years. We are increasing the percentage of creosoted ties very materially each year, and it is my understanding that in 2 or 3 years we will use nothing but creosoted ties. On the Rogerson-Wells line we had sample stretches of creosoted ties. We are using creosoted ties in places all over the Oregon short line. This is done more or less in an experimental way thus far. We have authority to treat so many creosoted ties every year, and the number is increasing much each year, and I have been told by the man who has charge of the tie department that in 2 or 3 years they will all be creosoted, it gives much longer life. (3224.) Creosoting

adds about 35 cents to the cost of the tie. As to why we should provide for a better standard of construction so far as that item is concerned, on this cross-State line than we are actually using elsewhere on our system, the present construction we are doing this year is going in 100 per cent creosoted ties. That is on our main line, but some secondary main-line work is also creosoted. We have not paid as much as $1.75 for the ties that we have been purchasing recently; that is the figure after we buy them, treat them and get them on the job. That is what we figure it would cost us out here on the line.

(3225.) That is substantially the price of the creosoted ties
1765 that are going into our present construction. There is a lot of accounting to go into that. It varies a few cents in different localities.

Taking this estimate as a whole, it does not provide for a better class of railroad, a higher type of railroad, than our Rogerson-Wells line. It is substantially the same. The main difference is we have used a half section of ballast on this line where the Rogerson-Wells had a gravel surface. To that extent this would be a better line than our Rogerson-Wells.

Q. How about your grades and curves?

A. Are you talking about—I would judge you mean the nature of the roadbed?

Q. Well, I am including all of the physical characteristics of the line, which make it suitable for main line operation or otherwise.

A. This line of course was located on eight-tenths of one per cent ruling grade. The Rogerson-Wells line was located on a one per cent ruling grade, with a little helper section at Summer Camp Pass. (3226.)

I don't know as to whether that fact alone would make a material difference in the cost of construction. There would be some increase in the amount of grading and the amount of fill to be built quite substantially. The construction of those fills and cuts reducing the grades will not compensate us by lessening operating costs unless we have a heavy tonnage over it. If your engine is running light, with light tonnage all the time, there would be no material difference.

Q. Now this desert that you crossed in following the route of the cross-State line is the same desert that you crossed down on the line of the Central Pacific and the Western Pacific in Nevada, is it not?

1766 A. The country is substantially the same, only those railroads follow a stream of water down there, which is lacking up here.

All of those ranches that I spoke about on the Rogerson-Wells line are within 20 miles of that line, except 2 or 3 ranches. (3227.)

I determined how many cattle were down on the Rogerson-Well cut-off in the following manner: I was in there on surveys and the superintendent of the ranches told me. I camped at the various ranches on the surveys. I simply took the superintendent's figures

and remembered them. The number of cattle on the Rogerson-Wells line was not the determining factor in the location of that line. We located that line according to the topography of the country.

I don't know as I could tell you whether that line was located and constructed as a bridge line and not by reason of the local traffic to be served along it. I was instructed to make the survey; just what was back of that I could not tell you. They did not tell me to make the survey and locate the line where it would be convenient to haul out this cattle; (3228) they told me to locate the best line in the country. And I did not give any particular attention or consideration to what I found in the country when I went through, not as governing the location of the line.

Q. Now how far out on this plateau does the cold breath from the Three Sisters affect the land in your opinion?

A. I never did any camping out in the desert in the summer time there, other than stopping at Burns a good many nights at various times.

1767 Q. Do you think that cold breeze gets over the Walker Range and on out here 100 to 150 miles from Crescent, or do you think that information as to the breeze from the Three Sisters only affected the Crescent community?

A. I would judge from that frost data given at Christmas, at Cliff and at Silver Lake, that the Three Sisters must have had some effect over there by the temperatures given.

Extending south from the route of the proposed cross-State line, the high desert practically goes clear to Mexico, with variations, hills in between desert ranges. (3229.)

Naming the lines of railroad between Mexico and central Oregon that cross that desert area from east and west: The Southern Pacific crosses through the southern part of the country; also the Santa Fe. Through Colorado we have the Denver & Rio Grande, and through Nevada the Western Pacific and the Central Pacific. The Union Pacific through Wyoming. Then we have the Northern lines through the Dakotas and Montana. There is also the Los Angeles & Salt Lake from Salt Lake down to Los Angeles.

Q. Now in the 150 or 200 miles of desert area crossed by these various lines you have mentioned, have you been through the territory or over those railroads across the desert areas at all, or over any of them?

A. I have been over several; I haven't been over all of them.

Q. Those that you have been over would you say are running through a country that, from the standpoint of production of local traffic, is any better than this central Oregon country 20 miles to the north and south of the route of the proposed cross-State line? What is your judgment about that?

1768 A. It is not my judgment—it is my judgment they did not cross this desert for the local revenue; they crossed those deserts because there was not any other way of getting (3230) around them to get to their objective on the coast.

Q. Well, with respect to the routes of those other lines than across this desert area, the chief function and value of the lines, I would take it from your answer, would be as a part of a through transcontinental route and for bridge traffic rather than for the origination of local traffic adjacent to the lines in the desert area?

A. Oh, yes; certainly.

Q. Have you given any consideration to the possibility of the proposed cross-State line between Crane and Crescent Lake serving largely that function of creating a new transcontinental route between the East and the West, and providing as its chief function, or one of its principal functions, a line for the use of bridge traffic?

A. No. The traffic department has gone into that. I have not gone into that myself.

I said that in 1907 I ran a line 250 miles south from a point about 8 miles west of the Double-O ranch. As to how near that got me to a connection with the present line of the Western Pacific or the Central Pacific across Nevada (3231) we stopped the line at a place that was known as Duck Valley, south of Surprise Valley, Nevada, and north of the Black Rock Desert in Nevada. The Western Pacific was being constructed then, probably 40 miles north of where the Western Pacific is now in the Black Rock Desert country. The end of that survey I made from the line of the Central Pacific at
1769 its nearest point was 70 or 80 miles. As to the purpose of that survey, whether it was for a branch line from the Oregon Eastern Railway down south to a connection with the Central Pacific, the impression I got in those days was that we were exploring more than anything else, finding out what was in the country. That line was started out there with no particular objective, as far as I was instructed, and as I kept making reports, continually it became more and more unfavorable, and I was finally told to abandon it.

Q. Has there been anything in your testimony that was intended to leave the impression that the construction of the Rogerson-Wells branch was not justified from the standpoint of public convenience and necessity?

A. Before the construction of that there was insistent demand, from the Twin Falls country especially, for a short route to San Francisco.

Exam. ROGERS. Do you know that? (3232.)

A. Beyond that I could not say.

Exam. ROGERS. Do you know that, Mr. Witness, or does the traffic department know about that?

A. I have read in the Twin Falls papers accounts of meetings that were being held at various times, and I have talked with the ranchers in and around that district quite frequently. I think I have got a fairly good cross-section. But beyond that demand on the part of the people for the cross-State line, I have no definite knowledge. My position does not give me that inside information, whatever it might be, beyond that.

Q. (By Mr. McCULLOCH.) You are simply in the operating department of the Short Line and you are not familiar with the traffic of the line so much as the operating end; is that correct?

1770 A. I work under the direction of the chief engineer, not the operating department.

Now, I mentioned two or three million acres of grazing land adjacent to the Rogerson-Wells line. As to whether I pretty generally went over those lands to see the character of them and determine (3233) whether they were suitable for grazing, I had crossed them by several different roads. As far as knowledge other than gained from crossing that range in various directions from the roads, I have made no special research. Those two or three million acres do not all lie within 20 miles of the Rogerson-Wells line. Some of them were further away than that. The bulk of them, though, were within 20 miles.

Q. Would you say, Mr. Stacey, that you had made such a report of the area on Exhibit 3 enclosed by the irregular brown lines and labeled "High Desert nonproductive area," as to the character of soil conditions, population, possibilities of production, matters of that kind, as you would wish to give if you were employed as an engineer to make a survey and report on those subjects to a railroad or anyone else that was employing you for that purpose?

A. I certainly would not want to give any person I was employed by the idea that there is any substantial tonnage to be expected from a country of that kind.

Q. That was not just my question. What I wanted to know was, if you had made such an examination of the territory throughout the area enclosed by this irregular brown line on this exhibit as——

A. This is the nonproductive area, I think, shown by the dotted brown line rather than the orange-colored line (3234) (indicating on Exhibit 3).

1771 Q. In the territory within 20 miles, generally speaking, on either side of the route of the proposed cross-State line between Crane and Crescent Lake, have you made such an investigation of entire area, as to its natural resources, their present development, the possibilities of their future development, fertility of the soil, possibility of raising crops, possibility of sustaining a livestock industry, possibility generally of producing traffic or tonnage for a railway, as you would expect to make as an engineer if you were employed for that specific purpose?

A. No. If I was employed to make a report on that, of course I would make a special trip out there. I have been over it off and on for the past 20 years, at various times, but I would want to reinforce myself with a trip over it to notice any change that might have occurred, if I was asked to make a report on it, of course.

My total inspection of this area just described from Burns over to Crescent Lake until I got back to LaPine took three days. Going across then it took me about a day and a half (3235) to make the inspection I did—a little better, probably a day and three-quarters

The existing main or branch lines of the Oregon Short Line do now traverse what would be called arid or nonproductive areas in some instances. In southern Idaho where irrigation has not been developed it is arid country. There are extensive areas traversed by existing main and branch lines of the Oregon Short Line that at the present time are now arid and nonproductive, certain sections scattered throughout the State, of course, between the irrigated areas.

1772 Q. What investigation did you make last summer, or at any time, to enable you to say that the soil or soils along the route of the cross-State line were not susceptible of reclamation?

A. The water is the controlling thing in reclamation. No matter how good the soil might be, unless you can get water on it it is just worthless for any agricultural purposes.

Q. Well then, all you meant to say by your testimony on that point was that water lacking there could be no reclamation, but you did not wish to undertake to say that if water could (3236) be supplied, either by surface irrigation or from subterranean sources, that the soil was not fit or capable of producing crops of some kind?

A. There are large areas where the soil is unfit for cultivation, even if they had water available.

Q. Now what investigation did you make or information did you get to determine that?

A. In the greasewood alkali country, flat, occupying the lowest part of the valley, with no chance to reclaim through drainage, it is not agricultural land, in my judgment. I have never seen it accomplished.

I have seen and known of instances where water was put on such lands and it was ascertained that they were incapable of cultivation with water. I have seen attempts made to reclaim this alkali land, but never where this alkali land occupied the lowest part of the country. It is all right where you have a place to drain that water away and carry the alkali with it, of course, but out in these interior basins you can't reclaim the alkali flat because there is no place to drain the water to.

1773 As to whether the frost conditions which I described in the Christmas Lake and Fort Rock Valleys were peculiar to those valleys, or whether similar frost conditions were encountered in any part of the (3237) territory served by the lines of the Oregon Short Line, we have no areas on the Short Line as far as I know where we have frost conditions like that.

Comr. McMANAMY. Mr. Stacey, is your estimate intended to be in opposition to Mr. Buck's estimate or in support of it?

A. In support of it, with that minor correction, that I thought he was too low on his lava rock estimate.

Comr. McMANAMY. What was the date—did I understand you to say that you stayed all night at Lapine on your trip west?

A. Yes, sir.

Comr. McMANAMY. What was the date?

A. The night of July 20th.

Comr. McMANAMY. Any indications of frost there on that night?

A. No. He said the night before was the first night he had not had frost.

Comr. McMANAMY. Why I asked is, I was about three days behind you and I didn't see any indication of frost.

The WITNESS. No; he said it warmed up. There was no frost the night we were there either.

Comr. McMANAMY. Now his position was that the frost came from the cold winds from Three Sisters.

A. From that direction, those high snow-covered mountains.
(3238.)

Comr. McMANAMY. Yet the Three Sisters are located north of Bend?

A. I thought the Three Sisters were really west of Bend.

1744 Comr. McMANAMY. North and west, or west and north?

A. Possibly they might be somewhat north.

Comr. McMANAMY. And all of that irrigated district around Bend and Prineville is much closer to the Three Sisters than Lapine?

A. Yes; they are closer. The direction of the wind would have a great deal to do with that, though, I understand.

Comr. McMANAMY. What is the value of that land across there, that section of the country through which this survey passes, per acre?

A. Well, it is practically all range land. There is a lot of vacant Government land, I would judge from the appearance of it. I would hardly know. It would be about the minimum value that is put on land, whatever that minimum is.

Comr. McMANAMY. Well, you have included it in your estimate here for right of way at ten dollars an acre.

A. That is in the private holdings, I would judge, where it has reference to Harney Valley and the OO ranch.

Comr. McMANAMY. Well, 1,320 acres at $10 an acre, does that include your entire right of way?

A. Yes. Some of that is vacant Government land, of course.

Comr. McMANAMY. Then you have 845 acres of timberland at
(3239) $50.00 an acre.

A. That is the private holdings.

Comr. McMANAMY. Do you think there is 40 per cent of that right of way that would be timberland?

A. Yes; I am inclined to think so. The work is rather heavy over in those Walker Mountains, and we would need additional land for borrow purposes, I think.

1775 Comr. McMANAMY. Now I was rather struck with your estimate for cinder pits here. Did you ever build a four thousand dollar cinder pit with a two-stall roundhouse?

A. I have never built a cinder pit, but we have built—the operating department has constructed cinder pits, and that is the figure they gave me.

Comr. McMANAMY. You don't know whether it was a dry pit or wet pit, or what?

A. I am inclined to think it was a wet pit.

Comr. McMANAMY. For a two-stall engine house is that the custom, or don't you know? I don't want to take you aside from your line of work.

A. No; I understand. I don't know just where the dry pit should be or the wet pit should be.

Comr. McMANAMY. Your estimate is about 2 per cent different from Mr. Buck's. That is well within the limit of variation which is allowed in the estimate of two different engineers for the same project, is it not? (3240.)

A. Yes; that is about as close a figure as you can get.

Comr. McMANAMY. Ordinarily it is about as close a figure as you can get?

A. Yes; ordinarily 5 per cent would be very close.

Comr. McMANAMY. That is all——

Exam. ROGERS. Did you say that 40 per cent of this was timberland for right of way?

A. I never——

Mr. DEY. Of the value.

Mr. SPENCER. Forty per cent of the value of the land, or just what did you mean anyway, Mr. Stacey?

1776 The WITNESS. I stated that on account of the work being heavier on the Walker Mountains, where the timber is, it would naturally require more right of way for the borrow pits than it would in other places where the work is lighter.

Comr. McMANAMY. I think perhaps I am responsible for that. His estimate shows clearing sage 1,320 acres and timber 845 acres. 845 acres is almost exactly 40 per cent of 1,320. That is where that figure came from.

Redirect examination:

For a 100-foot right of way it would take, I believe, 12.1 acres to the mile. I do not know how much Government right of way there is in there now. (3241.) There is considerable Government land traversed by this line.

Q. Now, you were asked several times about your traffic, as to how you happened to know about traffic as an engineer; now what is the fact as to whether or not in your duties you have been for years the confidential man of the executives, being sent out by them as an engineer and to estimate traffic and determine whether or not lines or locations were feasible?

A. I have been asked to make reports on certain areas without railroad transportation, to furnish an estimated cost of the line and

the physical characteristics of it; also what is being grown there, and what may be the future possibilities of the region, and an estimated amount of stuff that might reasonably be expected to be shipped out.

Q. And you were asked about the cost of ties, whether you would put in burnitized ties or creosoted ties; I don't know if it was put to you just that way; or why you put creosoted ties in. What has been the tie standard in construction previous to the last three or four years, or two or three years?

1777 A. Previous to that we used a zinc chloride process, the burnitized ties.

That is called a burnitized tie. (3242.) That is less expensive than the creosoted tie. The policy has been changed from the use of burnitized ties to creosoted ties. The present construction, this year's construction, is all creosoted ties. Experiments, I understand, have led them to believe that they can increase the life of a tie through the creosote process so much longer than the zinc chloride process, that it is a financial saving to them to use the creosoted tie.

Comr. McMANAMY. What you mean by that is over a 10-year period the creosoted tie would be cheaper?

A. Oh, yes; the life would be so much longer.

The comparative cost of creosoted ties on the line or on the grade ready to place, as compared with burnitized ties, is that there is approximately 35 cents per tie difference. The burnitized process would cost approximately 25 cents; the creosoted process would approximately cost 60 cents (3243); at that 35-cent difference. The cost of the green tie untreated delivered on our rail is $1.15. They are purchased, I understand, for about 90 or 95 cents; then the cost of handling them, hauling to the tie treating plant, handling them, and so on, makes up the difference.

The commissioner compared the small differences between my estimate and that of Mr. Buck's. As to how we happened to get so close together when we are so far apart on some of those unit prices, Mr. Buck used a full ballast section and I used a half ballast section.

I am familiar with the Harney Valley; I am not very familiar with the Blitzen.

1778 Q. Do you know the quality and extent of the lands tributary to the Rogerson-Wells line, generally known as the Twin Falls section, the North Twin Falls section, the extent of the acreage in there of reclaimed lands approximately?

A. The Twin Falls north and south side projects, Minidoka Government project adjoining, and the Twin Falls-Salmon River project, and the Goose Creek project, and one or two other (3244) small adjoining projects, approximate 700,000 acres of irrigated land, all of very good quality, with the exception of two small projects, with ample supply of water.

Q. Is there any such comparable area to support the proposed cross-State line as surveyed by the Public Service Commission?

A. Oh, no; certainly not.

Exam. ROGERS. I want to get a little clearer in my own mind about this 40 per cent of the line, which I understood you to say that this line would pass through; that is, 40 per cent of the line would pass through timber; is that right?

A. No; 40 per cent of the right of way would be in the timbered area.

Exam. ROGERS. Well, would that be equivalent to say that 40 per cent of the line would pass through timber?

A. Not necessarily.

Mr. SPENCER. Well, what is the effect in this case?

Exam. ROGERS. As I make it, that would make 74 miles of timber that this line would pass through.

The WITNESS. Where the work is fairly heavy and the fills are large, a great amount of borrow material must be had, which means that you have got to buy more right of way than 100
1779 feet. If you have a fill 15 or 20 feet high, and leave a perfect bern on that, there is practically no borrow land left on your right of way and you have got to buy additional right of (3245) way to get the material from to make the fill.

Comr. MCMANAMY. Now you show 1,320 acres sage, 845 acres of timber, a total of 2,165 acres for the right of way. At 12 acres per mile that would be 185 miles. Doesn't that account for all of your right of way?

A. Yes. But within that area are certain Government lands, of course, where right of way won't be purchased, but in certain privately owned areas.

Comr. MCMANAMY. This is for clearing?

A. Yes.

Comr. MCMANAMY. Under your clearing item?

A. Yes.

Exam. ROGERS. You have got clearing timber 40 per cent of the total?

A. Yes; on account of that wide right of way necessary in the timbered country.

Exam. ROGERS. Now, of the 185 miles how many running miles would be through timber?

A. Approximately 35, I think; between 30 and 35.

Exam. ROGERS. About 20 per cent?

A. There is that area from Odell up to Crescent Lake, of course, that has never been surveyed and we just have to estimate that distance.

Exam. ROGERS. Where does the timber lie, between what points? (3246.)

A. The timber begins about five or six miles west of Fort Rock.

1780 Mr. DEY. How far from the Great Northern's new line?

A. The edge of that timber is probably 20 miles. The farthest edge, from the Great Northern line.

Mr. DEY. You haven't figured buying any right of way over the Government land, have you?

A. Oh, no; that is not necessary.

Exam. ROGERS. This was clearing, Mr. Dey, we were talking about.

Mr. DEY. Oh, yes. That is all. (3247.)

E. C. MANSON was thereupon called as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I reside at Pocatello, Idaho. I am superintendent of the Idaho division of the Oregon Short Line. That division contains 370 miles of main line, from Pocatella, Idaho, to Huntington, Oregon, and 930 miles of branch line in different parts, diverging from the main line. I have been on the Oregon Short Line Railroad 41 years. During the period of Federal control I was with the Railroad Administration at Washington and my duties were in connection with the office of Mr. Gray in handling different matters, in operating of the different roads. (3248.)

The so-called Oregon Eastern branch, owned by the Oregon-Washington Railroad & Navigation Company and operated for its account by the Oregon Short Line Railroad Company, extends from a connection with the main line of the Oregon Short Line Railroad Company about a mile east of the station of Ontario, and extends westerly through Harney County and along the Malheur Canyon, and thence through the Harney Valley to Burns, Oregon, a distance of 155.31 miles.

1781 The maintenance and operation of this railroad is and has been for many years last past in my charge. It was built first to Vale, the county seat of Harney County, in the year 1906; from Vale it was extended to Riverside in the year 1913; from Riverside it was extended to Crane in the year 1916, and from Crane to Burns it was extended in the year 1924.

Settlement and development of the country served by it (3249) has not taken place as hoped for, and it has been a losing venture from the start. It has, therefore, been necessary to operate the same in the most economical manner possible in order to keep the losses down as low as could be done and operate the property; and this policy has been consistently pursued both with respect to maintenance and to train operation.

The train service on the line has consisted and now consists of a mixed freight and passenger service, one train each way a day except Sunday.

The proposed railroad across the State of Oregon to Crescent Lake would spring from this Burns branch at a point 5 miles west of Crane and involve a construction of 185 miles.

In considering operation of the proposed line, Crane to Crescent, my testimony is based upon the traffic estimated by Mr. Lounsbury to be available to the line in the fifth year after its construction. I

have done this for the reason that it gives the maximum estimate of available traffic.

To determine the amount of gross tonnage to be moved we have taken the live tonnage given in Mr. Lounsbury's estimate moving into and out of each of the points specified, added to that the average weight of cars of the class required for the different commodities.

have utilized the empty cars made available from the inbound
1782 movement and figured on the movement (3250) of empties that it will be necessary to move into the territory to take care of the excess outbound loading.

The available tonnage, including the weight of cars in which the loads are moved and the empties into and out of the territory, is so small that the maximum amount of service that could possibly be considered would be daily except Sunday mixed train service; and to indicate this will state that as a result of our full utilization of the cars brought into the territory under load, with daily except Sunday service, we would have to move on the average each day the train ran as a maximum out of any one point 205 gross tons westbound out of milepost 250, and eastbound the maximum average would be 212 gross tons out of milepost 280.

To illustrate, would state that on the basis of this average a westbound train would leave Crane each day except Sunday with 72.9 gross tons; would leave milepost 133 with 140 gross tons; would leave milepost 150 with 146 gross tons; would leave milepost 180 with 147 gross tons; would leave milepost 230 with 181 gross tons; would leave milepost 250 with 201.9 gross tons; would leave milepost 280 with 181 gross tons, having that same tonnage into Crescent.

Eastbound on the average for each day except Sunday, the train would leave Crescent with 119.5 gross tons; would leave milepost 280 with 212 gross tons; would leave milepost 250 with 200 gross tons; would leave milepost 230 with 189.5 gross (3251) tons; would leave milepost 180 with 190.9 gross tons; would leave milepost 150 with 182 gross tons; would leave milepost 133 with 134 gross tons, and have that same tonnage into Crane.

1783 The mileposts referred to are the points designated in Mr. Lounsbury's traffic statement as the points to and from which he estimates traffic would move, no names having yet been designated for these proposed stations.

If the total tonnage for the fifth year, as estimated by Mr. Lounsbury, were available to be handled in full tonnage trains only 41.5 trains would be required to move the total traffic for the year.

The foregoing is a statement of the actual tonnage handled out of each loading point, but does not represent the average gross ton miles per train mile, which for this traffic and this service would average 167 gross ton miles per train mile.

The Oregon Short Line Railroad Company operates 1,527.16 miles of branch lines, and for the year 1927 the average gross tons per train mile on these branches was 469 tons per train mile.

In considering the train operation, the distance between Crane and Crescent is too great for a local train to cover within the hours of service. Therefore, it would be necessary to operate to an intermediate point half way between (3252) Crane and Crescent, which would require 4 crews and 4 engines daily except Sunday, and this operation would require certain terminal facilities at Crane, at Crescent, and at this intermediate terminal.

These gross ton mile figures do not take into consideration the passenger equipment. In view of the fact that there is not a town or settlement along this proposed line from Crane to Crescent
1784 Lake of 100 people on either side of the proposed railroad or at its proposed terminus at Crescent Lake, manifestly the operation of an exclusive passenger service is out of the question and mixed train service, carrying freight, passengers, mail and express, would be the service furnished.

The equipment for the passenger business would consist of a combination baggage, mail, and express car and a combination smoker and day coach.

At the present time dispatchers handling the main line between Glenns Ferry, Idaho, and Huntington, Oregon, a distance of 165 miles, also handle all branch line dispatching on the branches extending between these two main line points, and in doing so have reached the limit of the amount of this work that they can handle with safety. It will therefore be necessary to provide two additional dispatchers to handle this branch line operation, including the proposed branch to Crescent. (3253.)

Six new station layouts will be required, one of them to be at the intermediate terminal 95 miles from Crane, and another at the Crescent Lake terminal, and in addition 2 intermediate stations for each of the districts.

Six two-story combination freight and passenger station buildings will be required, the second story to be used as living quarters for the agent.

A one-wire pole line from Crane to Crescent, 190 miles, will be required; a two-stall engine house will be required at Crane with small auxiliary machine shop and other facilities such as heating plant, cinder pit, oil house, store house, sand house, coaling station, foreman's office, locker room, etc., and the necessary additional trackage and machinery.

The engine house crew at Crane will consist of a mechanical foreman, machinist helper, one roundhouse employee and one coach cleaner, and one carman.

1785 At the intermediate terminal a two-stall enginehouse will be required, a depressed cinder pit, a coal dock with power hoist, a combination building for oil house and engine supplies, and a sand house, dryer, and storage bin.

Two engine watchmen will be required at the intermediate terminal to take care of engines, clean, water, and fuel passenger equipment.

Trackage consisting of 2 passing tracks and a wye track will be required. (3254.)

The terminal at Crescent Lake will require a two-stall roundhouse, depressed cinder pit, combination building for oil and supply house, and a coaling station with power hoist; a wye track and necessary terminal yard tracks will also be required.

At Crescent Lake 2 engine watchmen will be required, and a man to protect inspection and interchange of cars with connecting railroads, also a carman.

The mileage between Crane and Crescent Lake would be divided into 14 sections, and each section would require a section crew of 5 men. This will make an average of 14 miles to the section as compared to 8 miles on the main line.

Necessary section houses, outbuildings and equipment for these section crews will, of course, be required, and water facilities at each section as well as at the intermediate terminal.

Facilities for watering engines will also be required at intervals of 20 miles.

The equipment for operation of this line, as set forth in exhibit prepared by Engineer Buck, is in my opinion necessary for its operation, and the prices stated in Mr. Buck's exhibit are the reasonable market prices prevailing at this time.

1786 The item of 80 freight cars in his estimate for equipment required for this line is based upon Mr. Lounsbury's statement (3255) of traffic which may be expected in the fifth year of operation.

The tonnage given by Mr. Lounsbury was divided by the average loading per car of the same class of traffic on the Oregon-Washington Railroad & Navigation Company, for the year 1927, which determined the number of loaded cars of freight that would be handled into and out of the branch.

An analysis was then made of these loaded cars to determine the number of empties which would have to be moved from one point to another, or moved from off the line onto the line, to provide empties for the outgoing loads.

The number of cars, loads, and empties so determined was then multiplied by the actual mileage such cars would make on the branch, with the result that it was found that in this fifth year of traffic we would have on the branch 374,463 loaded car-miles and 291,608 empty car-miles; a total of 666,071 car-miles on this proposed line.

Based upon the Oregon-Washington Railroad & Navigation Company, average of 23 car-miles per day, this mileage would represent 28,960 freight car days, and dividing this by the number of days in the year, 365, would indicate that for the movement solely on this line 80 freight cars should be provided.

This estimate is based upon the theory that this line must furnish its quota of the cars required for its business (3256), the connecting lines likewise furnishing their quota; and inasmuch as the prepond-

erant loading is in box cars we have used the average price for box cars, figuring that, while refrigerator cars cost more than box
1787 cars, flat cars cost less, and that the cost of the box cars would represent the fair or average cost of the equipment required for this traffic.

The average car-miles per day on the Oregon-Washington Railroad & Navigation Company is used for the reason that that line has very little bridge traffic, and inasmuch as there will be no substantial bridge traffic on this line it is proper to use the figures of the Oregon-Washington Railroad & Navigation Company.

If this proposed railroad were to produce substantial tonnage for movement over the existing railroad from Crane to Ontario, very considerable sums would be necessary to rehabilitate the line from Crane to Ontario. This would include ballasting, a large expense for additional tie renewals, strengthening wooden bridges of which there are 105 of from 1 to 12 spans, additional section crew service and other items, but we have eliminated consideration of same because it is apparent that the amount of tonnage to be developed by this railroad will not be substantial, and for this reason the maintenance expense not only of the proposed railroad but of the existing railroad from Crane to Ontario will be (3257) kept down to a figure substantially lower than the average cost of maintaining branch lines of the Oregon Short Line Railroad Company.

In this connection, however, it should not be contemplated that maintenance will not be a substantial and expensive item even from the beginning.

While a new line does not require expenditures to speak of for tie renewals, the expenditure for track maintenance and surfacing is substantially heavier upon a new line than upon an old line, and to a large extent this item offsets the saving resulting from lack of tie renewals.

1788 My conclusion in this regard is demonstrated by a tabulation of maintenance costs compiled for a line of railroad operated through a similar character of territory, owned and operated by Oregon-Washington Railroad & Navigation Company, between Ayer Junction and Spokane, Washington. This line from Ayer Junction to Spokane is 104 miles in length. Both are distinctly desert lines.

The tabulation shows by years the cost of maintenance in detail for 1915 to 1926, inclusive.

The line was opened in 1914. It is to be noted that for the first two years of operation, 1915 and 1916, the cost in round figures was $141,000 for the first year and $156,000 for the second year, while the cost in 1925 and 1926, respectively, was $157,000 and $153,000. The tabulation (3258) referred to is submitted herewith as exhibit.

This is the maintenance exhibit on the Spokane-Ayer line.

(Said statement was thereupon received in evidence, marked "Defendants' Exhibit 82, Witness Mason.")

The figures reflected by this statement are based on the present-day costs as actually incurred in the years 1925 and 1926, applied to the prior years for labor and material, thus making the showing for the various years truly comparative. As to whether the existing line from Ontario Junction to Burns would be considered a main-line railroad or the type of construction and maintenance of a main-line railroad, except the bridges that were built across the Malheur River, it is in no way comparable with main-line construction or suitable for main-line business. A main line of railroad is ballasted, has block signals, permanent bridges and openings, and pieces of double track, elimination of grades and of curvature, and is equipped
1789 with all modern appliances, such as switches that are not required to be (3259) opened and closed by hand, and electric switches, and different things of that kind, and that is done for the reason that we have a much higher grade of service and fast passenger trains that require a very high class of maintenance to keep it in shape for that kind of business, and that is followed by high-speed freight trains.

The main line that I have been talking about is the type of line maintained by the Oregon Short Line and the Oregon-Washington Railroad & Navigation Company through to Portland. Now, the Oregon Eastern is not comparable, because it is not ballasted at all in any way, and a great many of the bridges are wood construction. It has some 10-degree curves and some one per cent grades, and is not suitable for fast speed. That one per cent grade was injected into the line on the last extension that was built into Crane. The line crosses the Malheur River 28 or 29 times. We have a lot of high-grade steel bridges across the Malheur (3260), with concrete piers and abutments. The Malheur is not much of a river, except in the early spring, then it is quite a stream. It is rather wide and not very deep; frequently freezes to the bottom and we have a little trouble occasionally with the ice on that account. In the summer months it is used for a certain distance as a conveyor of water for irrigation. It never gets wild or out of the channel, or present any operating or maintenance difficulties, except in the early spring when the ice goes out; that is about the only time we have any trouble with it. There are no cloudbursts in that territory to any great extent.

We have a daily except Sunday mixed train service carrying what freight we happen to have and mail, baggage, express over the
1790 branch now into Burns. We leave Ontario at 10.30 in the morning, going up, and get into Burns at (3261) 7 in the evening—that would be 8 hours and 30 minutes; about 18 miles an hour. Down it is about the same. When I came to this line in 1887 it was a dirt railroad from one end to the other. It had small ties, untreated, 52-pound rail, and a very light business; wood bridges—we had but one steel bridge on the west end. The bridges to-day are all high-class steel bridges with concrete culverts or permanent structures of that kind. After crossing the Snake River at American

Falls to Tunupa—that is the second station west of Shoshone—a distance of close to 100 miles, we have no bridges at all.

The schedule time of what is known as the Rieth fruit trains or blocks—and they run every day in the year—is 24 hours from the arrival time at Huntington to the arrival time at Pocatello. (3262.) Now, that is the gross, not the net time—and from that the Idaho division that I operate must absorb all delays. As an example, if the train goes into Huntington with bad orders or hot boxes, or any other work in switching, the Idaho division absorbs the delays in the running time.

Now, on silk trains the speed per hour varies. I would say a fair average would be 20 miles. Of course, to go right through with them, there would be spots you have to run a great deal faster, of course. We have no speed limits on freight trains on the Idaho division. We have certain engines that we have a slight speed restriction on, but 45 miles an hour is not at all unusual and is permissible.

The number of cars ordinarily in a fruit block varies. Speaking strictly of fruit, we take any number of cars of fruit that is de-
1791 livered from one up and fill out with other freight, and we run a little light on tonnage. For instance, the published tonnage is 3,300 from Huntington east. Now, we let that train out, say, from 200 to 250 tons light; a little lighter on that than what we call drag tonnage. (3263.)

The number of cars of perishables we would ordinarily have depends on the season of the year—it varies so. From right now, beginning with the fruit season, moving east, apples and one thing and another, it would go from 25 to 30 cars. It depends a good deal on the condition.

As to how many cars, say, in that train to make up the 3,300, it will run 65 to 75, possibly a little more than that. It depends altogether on the weight, you know. Refrigerators, if you had a lot of them, their capacity is lower than the straight box car or freight car.

This 20 or 30 would be the peak movement from the Oregon-Washington Railroad & Navigation Company, but we develop a lot of fruit along the Oregon Short Line that is accumulated at Nampa, just the same as they accumulate them at Rieth and run them from Rieth east—the same way at Nampa.

We have extensive icing facilities at Nampa; we can spot 110 cars at one time.

As to the number of cars we have in these fruit blocks when they (3264) arrive at Pocatello—from Minidoka east, we fill out and we pull into Pocatello 4,000 tons.

Q. I know, but you are still not answering the question. How many fruit or vegetable cars—I mean, how many of these P. F. E. cars do you have in a train when you come into Pocatello, if you have got practically a full load as obtains in that country?

A. We can haul as many as 75 loaded refrigerators into Pocatello.

1792 Q. What do you get—the examiner asked you the maximum—whether 35 cars in that fruit block train was the maximum, as I understood the question. Is it or isn't it?

A. Well, no; it isn't the maximum. It depends altogether on the movement. Now, we may receive, say, 30 cars at Huntington from the O.-W. and we may pick up at Nampa 10 or 15 or 20 or 30. Now, out of Nampa—maybe I can make this a little clearer. You see, on account of our grades it varies. From Nampa east, from Nampa to Glenns Ferry we can pull 4,000 tons of anything, fruit or anything else. East of Glenns Ferry we reduce to 3,300 tons because of the grade out of Glenns Ferry. (3265.)

Comr. McMANAMY. Do you use a helper out of Glenns Ferry?

A. No, sir; out of King Hill, which is just east of Glenns Ferry, and that goes up to the top of the hill to Ticeska, and then from Ticeska east we can take the 3,300 tons into Shoshone; and from Shoshone east 107 miles into Pocatello we can take the 4,000 tons. Maybe I can make it a little plainer. You see, in running this fruit train we try to pick up in lots anything that is ready to move from Nampa that can be put on by switch engines, or anything that is ready to move from the Minidoka district, the south side branch and the north side branch, in order to deliver as near as we can a full train of fruit or perishables in that Rieth fruit block or the Nampa fruit block, as the case may be.

In reference to the speed we make with the silk train that is not what would be the maximum speed we make on the line—my running time for arrival at Huntington to arrival at Pocatello is 6 hours, 56 minutes. Now, I must absorb all delays, including

1793 everything that occurs at Huntington, and the speed on that train is very fast. Oh, we will make 70 miles an hour, that is nothing uncommon. In that distance we make just three stops for water. Our rules permit 70 miles an hour, but the average would not be 70 miles an hour; there are spots that you must run that in order to make your time and recover what you lose naturally in stops. It is all right for our engine crews to run 70 miles where they have to. We absolutely could not make any such service as that on a cross-State line down the Malheur Canyon, with the tonnage they have been talking about diverting to that line. (3267.) That road isn't built for any such speed, or anything of that sort.

I operate the Twin Falls branch. Why they don't use it more is rather a hard question to answer. They just simply don't use it. We have a good service, and we are willing to add more service as the business comes to it. It isn't what we hoped for, because we hoped for more. We furnish the service now and make all the connections, and make good connections for both freight and passenger at Twin Falls, but they don't seem to take that line.

Q. Well, do you furnish special service for shipments of livestock or anything of that kind, off of that line?

A. We do. We treat it just the same as the main line, as far as stock specials are concerned.

Q. What is that treatment?

A. Twenty cars or more.

Q. Well, does the character of your railroad through on to the East, in your opinion, have anything to do with the traffic going that way? Can you give better service, even, when the distance is taken into consideration, via Pocatello and Ogden, than you can via Wells?

1794 A. Well, if I was a shipper going to California I would ship (3268) via Wells, for the reason that the service is good, and it surely saves time; it saves the time and it saves the distance. You see, there's two ways to go into that Twin Falls country—you can go in via Bliss, don't have to go in through Minidoka at all—or you can go on down the main line as far as Minidoka and then across to Twin Falls.

Exam. ROGERS. Then in order to use it would you have to figure on which day the train is going to run?

A. Well, we would at the present time, Mr. Commissioner, for the reason that we run tri-weekly, simply because we have no other service, but if we had the business to handle we could handle the business if it was necessary.

Exam. ROGERS. I thought you said if you were a shipper you would use it.

A. Well, I would use it, that is true, because it is shorter, surely.

Exam. ROGERS. Would you use it and figure on which day the train was going to run?

A. Well, yes; that is what we have to do. We do that now with our stock specials and their trains.

Comr. MCMANAMY. Do you think the method of handling stock at (3269) terminals has anything to do with the failure to use that branch? What I refer to, Minidoka isn't a terminal for your line, is it?

A. No, sir; just simply a branch terminal for the south side and north side branches.

Comr. MCMANAMY. Stock would come in there on the main line and be set out there by switch engine, if you have one there, or by the local engine, or by the road engine?

A. Yes, sir. And then would move down to Twin Falls on
1795 a local freight train making all stops, but making the connection at Twin Falls for Wells, if they have stock. And at Twin Falls the train would be switched again and the stock would move down to Wells, but the branch train is usually made up ready to go, and all that is necessary is to put the stock from the incoming train on the outgoing train, about all there is to it. We have a switch engine at Twin Falls. (3270.) We have a mixed train from Twin Falls to Wells making all stops—mixed train service. The rate of speed is a little better than 16 miles an hour.

We turn from the east and west main line of the Oregon Short Line at McCammon, to go south to Ogden. That is 23 miles east

of Pocatello, and although that isn't a terminal it is simply a junction point, Pocatello being the terminal for both ends, the east end and the south end, but McCammon is the diverging point for the south. That is double-tracked between Pocatello and McCammon. We have other double-track between Pocatello and Huntington. The first stretch is from Pocatello to Michaud, 9 miles. The next stretch is from Minidoka to Dietrich, in spots; there are about 14 miles in there, and that was (3271) done when we reduced the grade to a five-tenths. We built the new line and took out the sags, brought it up to a five-tenths, and left the old main line as the secondary track.

The next stretch is from Dietrich to Shoshone; that is eight miles, in round figures.

Then the next is from King Hill to Reverse—that is about 26 or 27 miles—and we have right now in course of construction from Ticeska to King Hill to connect up that portion, and that is a little better than ten miles, and will be completed in about November, and that was done in order to get away from our two leading and
1796 ruling grades on the Idaho division, Glenn's Ferry being in a depression, and we rise both ways out of Glenn's Ferry. That isn't all—the next double-track is from Orchard to Nampa. That is 45 miles. We have none west of Nampa.

We have a great many long passing tracks, our standard being 5,500 feet, which will clear ordinarily 110 cars and an engine and a caboose, but we find they are too short. The length of trains is increasing all the time, our usual run being 125 cars. We have pulled in one instance as much as 154 cars, but it isn't economical with the present sidings, simply because sawing-by and the delays incident thereto (3272) doesn't do. 125 we can get by very easy. We have some lap sidings, and we can double over, in other places. On the main line the sidings will average between four and five miles apart.

Q. Now, I wish you would explain this livestock operation. It has been mentioned here that this livestock from these southwestern Idaho counties might go via the cross-State line. What is your opinion as to that, in view of the difference in the service, if there is any difference? Just explain that.

A. We have an agreement, or, rather, an arrangement with the stock shippers of Idaho and Oregon that we run a special stock loading train out of Glenn's Ferry the early morning of each and every Friday; whether we have one car or a hundred cars or no cars, the train is run. We run it out of Glenn's Ferry, for the reason that that is the division point and there is where our crews and engines are available. That train passes Nampa about two o'clock in the afternoon and picks up anything that may come in from the Murphy branch, or anything that is loaded in the vicinity of Nampa; then to Caldwell, where we have a very large feeding yard pri-
1797 vately owned by Mr. Smeed, one of the former witnesses; and it also takes care of the Wilder branch—there is some stock off of that branch comes into Caldwell, 11 miles long. And

(3273) then the next is Nyssa, for the Homedale branch, Ontario for the Oregon Eastern, and that is about all they catch, unless they should catch two or three cars from the "Pin" road at Weiser, a privately owned road, and their service is rather irregular and they may have some stock or they may not.

Well, now, that particular train runs through intact to Portland without feed. Occasionally there is a car or two, or maybe four or five cars, from Glenn's Ferry that may come in from the East from one of the branches over in that district that would have to unload and feed at Huntington.

Then we run a second train that handles all stock loaded at points east of Glenn's Ferry. For instance, off of the Twin Falls north side they come in at Bliss, or the Wood River branch, that comes in at Shoshone, the Hill City branch, which comes in at Shoshone, or the south side branch, which occasionally we have some hogs from Buhl and different points. Now, that stuff is all—and then we might catch something from the Montana division at Pocatello—that stuff is all handled west on a second train, run into Huntington, and run into Portland, so as to reach here Sunday evening.

Now, that is very good service, when you can load stock up as late as noon and be in Portland the next day without feed or without unloading. It is far better service than you could hope for by a branch line where you have two or three transfers to make. (3274.)

Q. Well, you heard the testimony in this case of the gentlemen who testified from southern Idaho—I think there was
1798 one shipper among the witnesses who was called—but you have been handling this livestock for forty years, have you not?

A. Yes, sir.

Q. And would you say that—how would the service compare if you undertook to divert this business, part of it, across the cross-State line, and a part of it via Huntington?

A. Well, now, I am just taking the service we have to-day. A shipment would be, we will say, Ontario, just to start at the end of the Oregon Eastern, and it would move into Crane, about—the train is due there now at 5.30 in the evening, and we can't better that any for connections that we have to make; and it will leave Crane, we will say, at 6.30 or 7 o'clock in the evening, and they must run 190 miles—figuring the five miles that they run over the present Crane branch, 185. Well, they would probably be 12 to 14 hours, maybe more, going from Crane to Crescent Lake, and that would be pretty fair time for that distance, and then they are transferred to the Southern Pacific and into Portland. Now, I would say off hand that would take not less than three days, including your feed—two and a half to three days—that would be my judgment on it, while the other way you come direct in 36 hours without a feed or unloading. (3275.)

Q. Well, let's come the other way—you start at Crane, you say—pick out some shipping point where livestock is shipped on that Oregon Eastern branch, near Burns, or at Burns.

A. And go around over the other line?

Q. Yes. Burns will be on a stub; won't it?

A. Yes; we do ship—there is considerable stock shipped from Burns, or has been, and that stock, were it coming to California by the proposed line, would leave Burns at 7.30 a. m., and we base that figure on our present service because of certain connec-
1799 tions we must make at Ontario for the east and west at 7.30 in the morning. There will be a train about 9 o'clock. A train is due there at 9.15, but about 9 o'clock. I give an hour there. Leave there about 10 o'clock in the morning. This is from Burns, in the morning. Now, then, it would depend altogether what our schedule would be across that 190 miles, but I figure it would take them just about as long to go from Burns around here as it would be from Ontario—very little difference.

Exam. ROGERS. Mr. Manson, have you given any consideration to what the construction cost or operating cost the train (3276) service would be across this proposed line if Mr. Newell's recommendation were carried out?

A. No, sir; I didn't. I didn't study Mr. Newell's exhibit at all, but I am just figuring from what our actual practice is to-day on branches that I have charge of.

As to the character of construction from Crane to Burns, whether it is an expensive or inexpensive piece of construction, I wouldn't say it was very expensive construction for this reason—they didn't encounter any rock at all. It is right on a flat, it is meadowland, you know, and in building the grade they weren't very liberal. We have parts of that road that is under water in the early spring when they flood their meadows. I am speaking so that my railroad friends here will understand it. It is almost impassable at certain seasons of the early spring. To give an example, we had an engine standing still on a side track in that flooded district that turned over of its own weight. That was on the Oregon Eastern. But the country is boggy. They flood it in the early spring, and they use the borrow pits—the only place—as irrigating ditches. We are soaked right up to the handle; it is just under water from one end to the other. (3277.)

1800 Mr. SPENCER. It is just a grade thrown up there across that meadow bottom—it has got to be reconstructed or strengthened if you have any traffic over it, is that it?

A. Well, maybe this will explain it. I made a trip over that line within the last—just before I came up here, the last trip I made, and it was so blamed bad that I was a little alarmed over it and I wired our people for authority to put men on there and put in a steam shovel to get material out so as to fix the thing so it was safe to get over it. Now, mind you, this was only between Burns and Crane, and near the Burns end of the line.

Comr. MCMANAMY. That wouldn't be on the cross-State line?

A. No, sir. No, it isn't on the cross-State line where this particular thing occurs. It is about 15 miles this side of Burns, into

Burns, and they just use the borrow pit by putting the ditch across it, throwing the water into the meadows and right over the track and onto the track.

Q. (By Mr. SPENCER.) Don't you think you have been spoiled over there on that main line you have got between Huntington and Pocatello?

A. Well, I am rather proud of that main line. It will do anything.

Q. Is there a large expenditure confronting you to undertake to duplicate anything like it for service and efficiency across the State? (3278.)

A. Yes, sir; there is no question about that. The line from Crane to Ontario would simply have to be rebuilt in this way. You see, we have so many 10-degree curves. In fact, it is just through one canyon after the other, and considerable grade, and you simply can't make speed on a line like that, it wouldn't make any difference how good the surface is; it is the other complications that come in.

1801 We have some equipment we plan for the cross-State line. I gave that equipment cost to Mr. Stacey or Mr. Buck, the estimate, motive power and equipment for the cross-State line. The kind of a locomotive we will use there is what is known as the Consolidation freight engine, for the reason the Oregon Short Line doesn't own a smaller freight engine than that particular class. As to whether we have got any of them that we can use and assign to that line, or whether we have got to buy some, we are short of that class of equipment right now and we are using that class of engine on the present Oregon Eastern, and we would have to use the same thing on the other line. Now, we can't even use a "Mike" or a Mikado engine on the Oregon Eastern, on account of the wood bridges, couldn't use them at all. The heaviest engine (3279) we can run up there is the Consolidation.

Exam. Rogers. What difference does it make, where you have got the line, whether you use the lightest engine you have got now? What does that have to do with it?

A. Well, I was just answering the question. We would have to use a Consolidation engine there, for this reason: There is no use of buying a big modern engine, say, for instance, like what the O.-W. are now receiving—those engines cost $112,000.00, and with certain improvements and additions as high as $127,000.00——

Comr. MCMANAMY. What engines are those?

A. These big 9,000's they are just receiving now.

Comr. MCMANAMY. Using them on the Oregon-Washington Railroad & Navigation Company?

A. They are just receiving eight of them, I think it is, six or eight.

Comr. MCMANAMY. What do the Mikados cost?

1802 A. A Mikado will run around, I would say, offhand—depend altogether on just what you want, whether it has a

booster and a Worthington heater, and one thing and another—but I would say, using to-day's prices, $52,000 to $55,000.

Comr. McMANAMY. And the Consolidations would run substantially less?

A. Yes; about, I would say, in round figures, around $40,000. Now, as I was saying, if you buy these big engines for the main (3280) line with the hope of transferring some of these other smaller engines, like the Consolidations, for the branch lines, you can't do that very well, because you haven't enough of the Consolidations to fit your branches, and you can't use the larger engines like the Mikado, which is the next heaviest engine we own.

The lightest engine we have is the Consolidation, then comes the Mikado, and we have so many restrictions on our branch lines we can't use Mikados.

Exam. ROGERS. The reason I asked the question, I didn't think that there was a large railroad in the country anywhere that didn't have planty of obsolete light engines that would be fit to perform the service which you say you would give across there in freight train service.

A. Well, Mr. Examiner, maybe I can explain that. Now, that isn't true with the Union Pacific system, and I say that for this reason: We recently retired a number of small obsolete engines. For instance, this year we retired some that were purchased in 1890. Now, we can't get the repair parts, and it would cost too much to renew the fire box and different things, and they are just obsolete; we just retired them. Now, then, the next thing you have is Consolidation.

1803 Comr. McMANAMY. You build fire boxes in your own shops (3281), don't you?

A. Yes, sir—well, no; not altogether, Mr. Commissioner. It is this way: We buy, say, six, and then cut out and put in one of the six that we have bought, but I don't think that we build complete any fire boxes for our modern engines, the modern plan being to purchase about six and then interchange them; you know, repair them.

Comr. McMANAMY. You mean purchase six back ends?

A. Yes, sir.

With respect to the kind of cinder pits I estimated were required there at the two termini, Crane and Crescent Lake, and at the intermediate terminal, we use reinforced concrete pits, as a rule, and they are all equipped with water, for the reason that we use all of our cinders for ballasting our branches and for different repairs in and around yards and surface tracks, industry tracks, and things of that sort, and all of our pits are equipped with water, for the reason that we don't put hot cinders in the equipments, simply because it ruins the equipment, to say nothing of burning out your ties if you unload them hot. That would include pits at such

points as Twin Falls, Brigham, Idaho Falls; at our terminal at Buhl we have a pit of that sort; at Shoshone we have one. (3282.)

The estimate for those cinder pits, as I recall it, was $4,000. That isn't far from wrong.

Q. Well, have you an estimate for equipment and for the maintenance and operation of that line in the way of passing tracks and section gangs and station houses, and appurtenant facilities as could be made for any kind of an operation?

1804 A. Yes, sir; we figured this on the lowest minimum. Now, if we are to receive anything like the business that has been mentioned here, of course we have not to go into a more elaborate system of buildings and more sidings and more telegraph offices and a little better shop facilities, more of them. For instance, instead of having the two-stall houses, it probably might require a four-stall house or six-stall house—it will depend altogether on what business is developed, but modern practice is to start at the low ebb and build up. (3283.)

Q. That doesn't obtain in the chambers of commerce—you are talking about railroads.

A. Yes, sir; absolutely.

1805 Cross-examination:

I have examined the estimates of costs of Mr. Stacey and Mr. Buck of this cross-State line. I didn't say that I had figured the cost of this cross-State line on the lowest minimum. We were referring to the equipment and the buildings and the sidings, and things of that sort, not the construction of the line. When I said I figured the cost of the equipment I think I included in that the locomotives and the freight equipment; and I think we included one ditcher, and possibly a rotary snowplow, simply because the snow at the west end is reported to be such that we must have a rotary plow to operate. (3284.)

As to how, from the standpoint of operation, the line west of Crane to Crescent Lake and standard of construction would compare with the present Oregon Eastern branch between Crane and Ontario, well, the construction would be on a branch-line basis, rather a good branch line. Now, we use on the present line rail varying in weight from 70 as a minimum to 90 as a maximum. It is mixed from 70 to 75, 80, 85, and 90. Then on the proposed line I would say offhand that they would lay 90-pound rail with the usual number of ties. We use treated ties entirely, you know, on all branch lines, the same as we do on main lines.

Q. I was asking, however, how the line as estimated by Mr. Stacey, from the standpoint of standard of construction, would compare, if constructed in that manner with the existing line from Crane to Ontario?

A. I would say it would be about the same as that line, as far as the construction part of it is concerned. It might not have as many bridges, but the general construction would be about the same.

I would say that the line from Crane to Ontario is now entirely without ballast. That would be true of the line from
1806 Crane to Crescent Lake (3285) if it were built on a branch line proposition.

I heard Mr. Stacey's testimony and Mr. Buck's testimony.

Q. I got the decided impression from the testimony of both those witnesses that the Oregon Eastern Railway back in 1905 and 1906 was planned and located and intended to be constructed to form a new through route across the State for the movement of traffic between western Oregon and eastern territories, to relieve the excessive tonnage that at that time was moving over the Columbia River route to Portland, and that their estimates of the cost of the line from Crane to Cresent Lake had been made on the basis of constructing such a line, if built at the present time, in accordance with the plans that were made back in 1905 and 1906. Was that your understanding of——

A. Well, no; I don't believe I understood it just that way. Now as I understood them to say, that they had figured on some ballast on this line, but not a full ballasted line. Maybe I have got it wrong, but that is my understanding of it. There is quite a difference between a surface of ballast, you know, and a complete ballast section of track. (3286.)

I would agree, then, with the testimony given by Mr. Buck, that if this line from Crane to Cresent Lake were built in accordance with his estimates and up to the standard that his estimates contemplated, it would be necessary to do quite extensive rehabilitation work on the Oregon Eastern branch between Crane and Ontario to bring it up to the standard of the rest of the line over to Cresent Lake, and that is for this reason—even over the territory mentioned the curvature isn't anything near as heavy as it is on the other line, nothing like it—in other words, from Crane to Cresent Lake, and from Crane to Ontario, there is quite a difference in the grades.

As to whether with respect to grades and curvature, we have any more adverse conditions between Crane and Ontario than we
1807 have in crossing the Blue Mountains between Huntington and Pendleton, or Huntington and La Grande, well, of course, I have never worked as an operating official on the Oregon-Washington Railroad & Navigation Company in this particular territory you name; but I think their grades are heavier than we have on the Oregon Eastern that I operate. The curves on the Oregon Eastern between Crane and Ontario are greater than on the Oregon-Washington Railroad & Navigation Company Blue Mountain line. We have some 10-degree curves, and the main line of the O.-W. (3287) I don't think has anything that severe. There are quite a lot of 10-degree curves on the Oregon Eastern between Crane and Ontario. I can tell exactly, though. From milepost 31 to milepost 40—that is through the canyon; from milepost 103 to 123.

I have in mind the following reasons for saying that if this cross-State line were built it would be impossible to operate the char-

acter of freight train service over it that now moves between Portland and Huntington on the Columbia River line, or between Huntington and Pocatello on the Oregon Short Line. The main line is put up for fast speed—that is why it was built as well as it was—while a branch line such as the Oregon Eastern as it now exists, with its heavy curvature and no ballast and second-hand rail, and one thing and another, tunnels, cannot stand the speed that we would naturally give the main line. The speed must be considerably lower. We can handle the same kind of freight, but not as quickly or as economically as we can on the main line. I cannot translate that comparison of the speed across the cross-State line and the Columbia River line of the Oregon-Washington Railroad & Navigation Company into (3288) figures so that we could have some more definite basis of comparison. As I said, I never worked for the Oregon-Washington Railroad & Navigation Company as an operating
1808 official, on this part of it. I don't know, then, what speed the O.-W. R. & N. Co., from Portland to Huntington, would make in handling either lumber or perishables, such as fruit, or broccoli, or celery, or things that move under ice in refrigerator cars. I don't know what their speed schedules are. I was comparing the speed of service possible over the cross-State line with the conditions as I know them on the Oregon Short Line. I would say, offhand, that 30 hours would be our schedule on the Oregon Short Line between Huntington and Pocatello for freight trains that carry lumber. (3289.) Now, you know, we move a great deal of this lumber in those Rieth fruit blocks. (3290.) We don't move all our lumber in the fruit blocks, but a great deal of it.

The distance the short way between Huntington and Pocatello is 327 miles. The short way is the way the freight moves.

Q. Well, that would be at the rate, in your lumber trains between Huntington and Pocatello, of 10 miles an hour. Now is it your testimony that a freight train service that would take lumber from western Oregon across the State over the route of the proposed cross-State line to Crane could not be maintained with safety at an average speed of 10 miles an hour?

A. They probably would make the 10 miles an hour, but that is not all that enters into it. We must not overlook the fact that this freight that is moving on the cross-State line is moving in a mixed train service, or, rather, a local service. That moves much more slowly than does a main line freight train that does not make stops except for water or something of that sort.

Q. Suppose that the traffic offered for shipment or routed for shipment over the cross-State line was sufficient to require more than mixed train service, would you say that lumber then (3291) could not be transported across the State via that route at substantially the same average speed as it can move and does move
1809 between Huntington and Pocatello?

A. It would probably make 10 miles an hour while moving; that is true.

Q. In your judgment, what would be the maximum speed that could be made with safety over the proposed cross-State line between Crescent Lake and Ontario, if constructed in accordance with the standards of estimate given by Mr. Buck?

A. Our speed restriction on the Oregon Eastern as of to-day is 20 miles an hour.

Q. Yes; but then I didn't mean that. Mr. Buck testified he made estimates of the cost based on a standard high class line—I think those were the words he used—fully ballasted. Now, if a line were constructed in accordance with those standards, what would you say the maximum speed limit on that line might be made with safety?

A. Taking it, using it on your own language on it, high grade ballasted line from Crescent Lake to Crane, and the Oregon Eastern from Crane to Ontario put in shape for such business——

Q. No; just to Crane.

A. Just to Crane, there is no reason why we should not make as good time on the line from Crescent Lake to Crane as we do from Huntington to Pocatello, with the same kind of a railroad, built in the same way. (3292.)

Q. Well, with the kind of a railroad that Mr. Buck described.

A. That is what he described.

Q. Yes; all right. Now, would you say——

Exam. ROGERS. Well, wait just a minute. I am not sure that Mr. Manson knows what sort of a railroad Mr. Buck did describe.

Mr. MCCULLOCH. Well, I asked him if he had not heard his testimony, and he said, yes.

The WITNESS. Yes; I heard his testimony.

1810 Exam. ROGERS. But you understood that was a line without ballast?

The WITNESS. Well, that is the way I understood Mr. Buck. I didn't understand that he was going to build a high grade, standard embankment and standard-ballast railroad between Crane and Burns, or between Crane and Crescent Lake.

Exam. ROGERS. Mr. Buck has got 474,000 cubic yards of ballast. Does that sound like a road without ballast?

A. No, no; that would be surfacing ballast all right.

Exam. ROGERS. So you didn't understand Mr. Buck's construction?

A. No. That would be quite similar to the line from Rogerson to Wells.

Q. (By Mr. MCCULLOCH.) But my question contemplated that the line from Burns to Crescent Lake, as estimated by Mr. Buck, would be ballasted, and you were answering it on that assumption? (3293.)

A. Oh, yes; on that assumption. I answered your question as you put it to me.

It is true there would have to be considerable rehabilitation to bring the line from Ontario to Crane up to the standard estimated by Mr. Buck for the line west of Crane to Crescent Lake.

Q. And after that rehabilitation had been made and it had been brought up to the standard of the line west, then would there be any reason why you could not maintain a considerably higher speed limit than 20 miles an hour, which is your limit now on the portion of the line between Crane and Ontario?

A. If the line was constructed just as you state, and if the line from Crane to Crescent Lake was first class and ballasted, as you state, then the time could be increased.

Exam. ROGERS. Mr. Manson, I am wondering if this is true with respect to this train service across this line; and that is that
1811 the train service that you would give across there, if the line were built, would depend upon the traffic that there is to move across the line?

A. Absolutely.

Exam. ROGERS. If the traffic to move across the line (3294) equaled the traffic that now moves on your main line, you would have service across there equal to your main line?

A. Yes; that is right.

Exam. ROGERS. And, on the other hand, if the traffic that moves now over what is your main line was no more than you expect from this cross-State line, you would probably have the same service on your main line as you expect to give over the cross-State line, wouldn't you?

A. You mean the same train service?

Exam. ROGERS. If you had no more traffic on your main line than you expect off of the cross-State line, I say you would probably have the same train service on your main line that you anticipate giving on your cross-State line?

A. That is it exactly. I misunderstood the question. It would be just the same. In other words, if we had no freight on the main line we would have to drop back to a mixed train service on the main line, as we once had when we were quite young, just the same as we would on the Oregon Eastern extension from Crane to Crescent Lake.

Exam. ROGERS. And if the traffic develops on the cross-State line, if built, to a point where it is equal to the main line, you will have main line service?

A. We would have, exactly. We would furnish service to handle the business, the same as we do on the main line.

Exam. ROGERS. Isn't that what all this talk about train (3295) service amounts to?

1812 A. Well, from my viewpoint, yes; that is what it is. If we built a high-class railroad to handle any kind of business, we would handle it the same as we do anything else, if the business is there to be handled.

Q. (By Mr. MCCULLOCH.): Was the line from Crane to Burns built according to a standard of construction, and in the way that you have described, sufficiently good in your judgment from an operating standpoint to take care of all the traffic that it was ex-

pected would move over that line? And in saying that, I have in mind particularly the 10 cars of lumber a day that it was anticipated would move from Burns from Herrick's new mill.

A. Well, you understand the O.-W. R. & N., as I understand it, did not build that line from Crane to Burns.

It was built independently and acquired subsequently—that is my understanding of it. It is operated in my division. It was built by contract by the Morrison-Knudsen Company. Since I have operated it, some work has been done toward rehabilitating or improving the character of construction on that branch, in this way: We have unloaded a great many cars of cinders in the worst spots and have used other surfacing (3296) materials as could be got handy to take care of some of their worst wet spots. In its present condition it would certainly be suitable for the movement of 10 cars of lumber a day from Burns to Ontario.

Q. Now, is the traffic from southwestern Idaho destined to California via the Rogerson-Wells branch, routed through Minidoka? That is, is it handled through Minidoka as an operating proposition if it is unrouted or it is simply the Wells gateway that is indicated?

A. Well, if it is going to California over the Rogerson cut-off, as we call it, and so routed, we take it, set it out at Minidoka and take it south from there, or west.

1813 Q. Is that a longer route than the route through Bliss and Rupert?

A. There is a difference of, oh, not over 13 miles. It is just a very little difference in favor of Rupert.

Exam. ROGERS. That answer did not answer your question there, Mr. McCulloch—I would like to have it answered. Suppose that you got traffic now from, say Boise, going to San Francisco, and it is unrouted; the shipper does not say anything about routing—do you take it by the Rogerson cut-off or do you take it around by Ogden? (3297.)

A. Well, I can't say as to that. I am not sure just which way it does go. If it was unrouted and was moving to California we would doubtless move it by way of Minidoka and Wells. There is so very little of it that it might go the other way. It is a hard question to answer. (3298.) I never heard it asked before it came up here. The great bulk of it, I would say, is routed by the shipper.

Exam. ROGERS. Mr. Manson, I have been wondering how that situation on the Rogerson cut-off is ever going to change. As I understand it, the carrier said when the shippers route enough that way, why, they will put the train service on there to take care of it properly, and the shippers, as I understand it here, say that they won't use it because the train service is not there. I don't know how it is ever going to change unless you have a cloudburst of traffic at some time and have it start.

The WITNESS. Mr. Examiner, I will guarantee you this: (3299) If they will give us the business we will put on the train service.

Exam. ROGERS. Well, somebody has got to start first, haven't they? You are going to have to give them the train service first, or they are going to have to route the traffic first, one or the other?

1814 A. That is true.

Comr. MCMANAMY. Do you know anything about the train service you get out of Wells?

A. Yes, sir. We have an arrangement with the Southern Pacific. We have, of course, regular interchange tracks there and should we have perishables or livestock, or anything of that sort for the west, we notify the Southern Pacific at Ogden and they invariably have a connection either there, or close, to take it.

Comr. MCMANAMY. Wells is not a division point on the southern Pacific?

A. No, sir; it is not.

Comr. MCMANAMY. Do you think this has anything to do with the failure to use it, that is, that the Oregon Short Line traffic leaves the main line at a branch line junction point and it passes through about two such branch line junction points and is picked up by the Southern Pacific at another branch line junction point?

A. Yes. (3300.)

Comr. MCMANAMY. Would that service in ordinary railroad practice compare with the service rendered on your main line from Minidoka down to Ogden, considering that the traffic approaching Minidoka was in one of your through trains?

A. A shipment of that sort moving into Minidoka and from Minidoka to Twin Falls and to Wells, can make it quicker if it is loaded and moved on the day we are advertised to run than it can by going from Minidoka on to Pocatella and south.

Comr. MCMANAMY. How about the switching and handling at the various junctions?

A. Well, the main line train would set out the car on the branch receiving track. We have a switch engine there that makes it

1815 up into a train for Twin Falls and Buhl, and the switching engine at Twin Falls, to cut the cars into the outgoing train.

Comr. MCMANAMY. Is there a switch engine at Wells?

A. At Wells; no, sir. We put it in on the transfer before they put up the passenger station.

Q. (By Mr. MCCULLOCH.) Mr. Manson, I understood you to say there would be no substantial bridge traffic on the cross-State line if built. Was that your view?

A. I don't think I made any such statement.

Q. I made notes, and I thought you said that exactly.

A. Possibly I did, but I don't recall it.

Q. Well, is that your view, that if the cross-State line were (3301) built it would not be used to any appreciable extent for the movement of bridge traffic, or as a bridge line?

A. Well, I don't know about that.

Q. Well, I understood you to express an opinion. That is the only reason I asked you.

A. No; I don't think I did. I don't recall it.

With reference to my comparison of maintenance costs on the Spokane-Ayer section of the O.-W. lines, I took that particular section of line to make my comparison because it is much similar country to the proposed new line. It is my understanding that the type of line would be similar in all respects and the character and amount of traffic be similar. There may be more business, of course. It is hard to tell what business will be on the other line. We took it because they are both desert lines, you know. That was the reason for it. (3302.)

Maintenance depends to a certain degree on the amount of traffic handled. Still, you have got to keep your road in a good passable condition at all times. But it is true a great deal of the maintenance expense varies with the amount of traffic carried on the line.

1816 Q. Then, would you think it would be fair to use as a comparison a main line with main line traffic, when you are determining what you say would be maintenance costs on a branch line with light traffic?

A. Well, as I undestand it, this is not going to be a branch line; it is going to be a pretty good railroad and about the same kind of a railroad as the O.-W. have in this territory.

Q. And the same amount of traffic?

A. Well, as to the traffic, that is pretty hard to answer, because nobody knows what we are going to have.

Comr. McMANAMY. Do you know whether or not the Northern Pacific line still uses that division from Cheney in to Spokane?

A. No; I am not familiar with that territory at all.

Q. (By Mr. ELLIS.) I believe you stated that the distance between Crane and Crescent would be too great to operate as one division, on account of the local service between. Would not that depend upon the amount of local service and the amount of local traffic that you would have to pick up and deliver along the line?

A. Well, no; not to any great extent; and this is the reason for it: The Oregon Short Line, and especially the Idaho division, speaking of that, because that comes under my jurisdiction—I have the largest division—we have no main line districts or branch lines that are anywhere near that length. That is a long way, 190 miles. Now another thing enters into it that makes it another very important question. On these runs the pay of the men is based on eight hours, time and a half after eight hours. If it begins to run into many hours, it is cheaper to put on two, split it up, than it is to pay a heavy penalty overtime, or time and a half.

Comr. McMANAMY. Mr. Manson, isn't the pay of the men

1817 based on 8 hours or less, or 100 miles or less?

A. That is true, yes.

Comr. McMANAMY. Regardless of distance? does the overtime begin after 8 hours?

A. Yes, sir. (3304.)

Comr. McMANAMY. Regardless of distance?

A. You see, on mixed and local runs, that is a little different than the main line.

Redirect examination:

Q. (By Mr. SPENCER.) Mr. Manson, the examiner asked you whether this traffic discussion amounted to anything more than whether you would put on the service if the traffic was presented, as you do on the main line of the Oregon Short Line, and you answered if the traffic was offered you would furnish service for the cross-State line just as you do for the main line. Now, have you had any instance in the forty years of your experience where any line, main or branch, starts out with its full tonnage capacity in the first year, or the second year, or in the fifth year? Is it a gradual growth, or is it an immediate presentation of tonnage?

A. There is a gradual growth.

Q. Now, if there is traffic on a main line, does that involve more extensive equipment and present greater possibility of service than on a line where traffic does not exist?

A. On the main line, of course, that would be true.

Q. And do you know whether the shipper has a tendency to abandon such service where there is traffic and experiment on a new line? Or have you had any opportunity to make any such comparison? (3305.)

A. Well, my judgment is that they would not.

Exam. ROGERS. Don't misunderstand my questions, Mr. Spencer. I said nothing about what the traffic was going to be.

1818 Mr. SPENCER. No; I understand. That was just the point. We don't any of us know what the traffic is going to be. But I am asking. I am asking in the light of experience, whether there is any occasion, or any time in this man's operations, which have been very extensive, over a great many years, whether there is the anticipated conditions here of bringing in a great big slab of traffic and putting it over a railroad, has ever happened in your experience or operation?

A. No, sir; it never has. We start in low and build up as——

Exam. ROGERS. Well, Mr. Spencer, I won't ask Mr. Manson that, but do you know of any case where we have had a like proposal as we have here?

Mr. SPENCER. Well, I think this probably does stand in a class by itself. I don't remember any occasion of that kind—that is true.

Now, balancing traffic that is as near equal in both directions as you can get, is a very great advantage in railroad operation, both from efficiency and economy. (3306.)

Now, for a full ballast section, we use about 3,000 cubic yards for a mile, as a rule. And we have 190 miles in round mileage to ballast. And a full ballast section on my basis would require 570,000 yards.

We use at the present time on our main line 100-pound rail, but the new standard adopted recently is 110 pounds to the yard for straight-

way and 130 pounds for heavy curvature, like the second district. (3307.) On the main line of the Oregon Short Line, we have 100-pound rail from Huntington to Pocatello. We have the same weight on the curves, as we have no curves that would require 130-pound rails.

Q. Now, of the lines you operate, the branch lines, have you any branch line with as thin traffic and as discouraging
1819 results in operation as the line that serves the Harney Valley from Burns to Ontario?

A. About the only one we have that compares with it in leanness is the Homestead branch.

Q. That is owned by the O.-W. R. & N., too.

Comr. McMANAMY. How about the Rogerson-Wells?

A. Well, the Rogerson-Wells does get some business, you know, Mr. Commissioner, between Twin Falls and Rogerson, and we call that, as a whole, you know, in operating it, see, Twin Falls to Wells.

Q. (By Mr. SPENCER.) Have you had any calls to ship out special trainloads off the line from Rogerson to Wells?

A. Trainloads?

Q. Any special service in there to take out tonnage or to bring it in? (3308.)

A. Yes; we have had one or two trains of stock since the line was opened. For instance, I think it was last week, we had a train of lambs; and by train, I mean 13 cars, that moved from San Jacinto, the Utah Construction Company's large ranch, to Rogerson and to Twin Falls, and east.

Q. Those are special services you are talking about?

A. Yes; but very seldom. And in addition, we have our regular operation three times a week.

Comr. McMANAMY. Mr. Manson, how does it happen, if the service on the Rogerson-Wells is heavier than on the Burns branch, that the one gets a mixed train each way daily and the other gets train service tri-weekly, or three times a week?

A. The Twin Falls-Wells line is very thin on traffic. There is not very much, except, as I say, between Twin Falls and Rog-
1820 erson. It is another very thin line, but it is not as thin as the Homestead.

Comr. McMANAMY. But one gets daily service and the other gets service three times a week.

A. Well, we have the same thing over part of the Homestead branch daily, or except—it is three times a week, you (3309) know, on the Homestead branch. There is more business on the Twin Falls-Wells line than on the Huntington-Homestead.

Exam. ROGERS. Is there more business on the Burns branch than there is on the Rogerson cut-off?

A. Well, I would say it was pretty close to the same. The Oregon Eastern may be a little heavier, just speaking offhand from memory.

Exam. ROGERS. Where, on the Burns branch?

A. Yes; on the Burns branch.

Exam. ROGERS. Is there any State regulation in this State such as there is in some cases about daily train service?

A. No, sir; there is none in Idaho, and there is none in Oregon that I know of.

We have mixed train service into Burns. We carry passengers. There is nothing of that kind required at Wells to go up into southern Idaho like there is into Burns. The passenger traffic is very thin on the Twin Falls to Wells line. I have the July statement and, as I recall it, we handled 58 passengers in one direction and about 60 or 62 from Wells to Twin Falls. (3310.)

I know about applying to the Oregon commission to shorten up our service into Burns. That was tried a year or two ago and refused. The last we heard of it was this: The Burns people, when we made our last change in time in May of 1928—they have always wanted a connection with No. 26, which leaves Portland in the evening, due at Ontario the following morning. That makes
1821 them a very good train from Portland to Burns. And by leaving Ontario 15 minutes after the arrival of No. 26 we got into Burns a little late for the mail and papers to be distributed, and the people of Burns requested that we get the train in there at an earlier hour.

Recross-examination:

The traffic that moves over the Rogerson-Wells branch is, to a substantial extent, at the present time, bridge traffic. There is very little local traffic between Rogerson and Wells. We do get a little ore out of Contact occasionally, but it is nothing regular. And we do get some stock occasionally from the Utah Construction Company. (3311.)

J. C. M. DODDS was thereupon produced as a witness on behalf of defendants and, having been duly sworn, testified as follows:

Direct examination:

I am auditor of disbursements for the Oregon-Washington Railroad & Navigation Company. (3312.) I have been in the auditing department of the O.-W. R. & N. since September 4, 1907.
1822 I have a statement of the mileage and the cost of the so-called Oregon Eastern branch owned by the Oregon-Washington Railroad & Navigation Company extending from Ontario Junction to Burns. The cost of that was $7,033,112.98. The mileage is 155.31. I haven't the figures showing the cost of the extension, or the investment of the O.-W. R. & N. has made in it, from Crane to Burns. They are not shown on this statement. It is included in that 7 million. The Brogan branch is not included in that. That is a separate branch. (3313.)

I have a statement of the cost of the Des Chutes branch, the branch from Sherman Junction to Bend. Of that, 95.3 miles are owned by the Des Chutes Railroad Company. The cost of that was $6,477,129.70. The number of miles we use jointly, or are operated jointly

with the Oregon Trunk Railway is 53 miles. The investment cost in that mileage is $3,566,454.80. The total cost of the two, 148.3 miles, was $10,043,584.50.

I do not know over what period of years this operation is to extend on this 53 miles. It is a long-term contract; 999 years is my remembrance.

Q. Is this the date of the contract [exhibiting document to witness]? (3314.)

A. The contract is dated May 17, 1910, and it states it is for a period of 999 years.

Q. Now the question was asked whether that contract carries the right to operate an extension from Bend. Who is that contract between—what parties?

A. The Oregon Trunk Railway and the Des Chutes Railroad Company.

It is my understanding that the extension on beyond Bend is by the Great Northern Railway and not by the Oregon Trunk. I am not aware of any provision in that contract giving the right of extension——

1823 Mr. SPENCER. I don't want to put the contract in evidence, unless there is some question about it. It is the only copy I have. There is not any provision in there, and it is between different parties. You can look it over [passing document to Mr. Ellis].

Q. Now, what rental is the Des Chutes Railroad Company committed to pay for that 999 years?

A. 4½ per cent on the invested cost, which, in 1926, was $92,000.04.

Q. And, in addition, participating in taxes and interest?

A. Yes, sir; they participate in the taxes.

Q. And maintenance?

A. And maintenance, operating expenses, and the like.

The Oregon-Washington Railroad & Navigation Company is a party to that agreement and obligated under its terms.

I have a statement of the operating income, revenues and expenses by accounts assignable to the Des Chutes Railroad Company. This is the calendar year of 1926, for the entire operation. The result of the operation there is a deficit of $255,685.21.

(Said statement consisting of 6 sheets was thereupon received in evidence, marked "Defendants' Exhibit No. 83, Witness Dodds".)

I have a condensed statement of the analysis of the business on that branch, that is the revenue received on the branch and business forwarded from the branch. (3316.) And business local to the branch. I have an exhibit showing how that is divided. That is for the operation by the O.-W. R. & N. Co. for the year 1926.

(Said statement consisting of one sheet was thereupon received in evidence, marked "Defendants' Exhibit No. 84, Witness Dodds".)

1824 I have a statement showing for the year 1926, the cars and tons, by commodities, of freight traffic forwarded from,

received on, local to, and passing over this Des Chutes branch. It consists of 3 sheets. (3317.)

(Said statement consisting of 3 sheets was thereupon received in evidence, marked "Defendants' Exhibit No. 85, Witness Dodds".)

I have a statement showing the shipments of alfalfa hay and hay not specified, from all points on the O.-W. R. & N. destined to points in western Oregon, including Portland, for the years 1926 and 1927. It consists of 11 sheets.

(Said statement consisting of 11 sheets was thereupon received in evidence marked "Defendants' Exhibit No. 86, Witness Dodds".)

I have an income, profit and loss statement on the O.-W. R. & N. for the years 1921 to 1927, inclusive. It consists of one sheet. (3318.)

(Said statement consisting of one sheet was thereupon received in evidence, marked "Defendants' Exhibit No. 87, Witness Dodds".)

The hay exhibit includes destinations of the Southern Pacific Line, the Oregon Electric, the Spokane, Portland & Seattle—it is all points in western Oregon for which we had shipments, including the Union stockyards at north Portland.

I have the general balance sheet of the O.-W. R. & N. Co. reflecting its financial condition as of the close of business on December 31, 1927.

(Said statement consisting of one sheet was thereupon received in evidence, marked "Defendants' Exhibit No. 88, Witness Dodds".) (3319.)

1825 Q. (By Mr. SPENCER.) Now contention has been made, Mr. Dodds, but perhaps not in this case, that the poor showing of the Oregon-Washington Railroad & Navigation Company is because of inadequate divisions allowed to it by the other Union Pacific system lines. Have you information with respect to the divisions accorded to the Oregon-Washington Railroad & Navigation Company in operations where the Oregon Short Line and/or the Union Pacific Railroad Company are involved?

A. Yes, sir.

Q. And also the divisions on business interchanged with the Northern Pacific Railway Company, the Great Northern Railway Company, the Chicago, Milwaukee & St. Paul Railway Company?

A. Yes, sir.

Q. I will ask you just to explain now what divisions are accorded to the Oregon-Washington Railroad & Navigation Company on business originating on its lines moving through these various gateways to the East, and on business received by the Oregon-Washington Railroad & Navigation Company from off these other lines?

A. On business between Portland and Omaha they were receiving 35 per cent of the total revenue; from Portland to Salt Lake, 53 per cent.

Q. Well, how does the mileage divide? The mileage via Huntington on Omaha would be 22.5 per cent, while they are allowed 35 per cent of the revenue. And on the Salt Lake, the mileage (3320)

would be 44.1 per cent, while they are allowed 53 per cent of the revenue.

Q. And compare that with the allowances made to them through the other gateways, and give the gateways and the roads involved.

A. Allowances through Wallula gateway of the Northern Pacific, the Northern Pacific gives 18 per cent, the Northern Pacific
1826 retaining 82 per cent. Through the Spokane gateway——

Q. Did you give that gateway? That is the Wallula gateway?

A. Yes, sir. Through the Spokane gateway with the Great Northern, the O.-W. R. & N. Company receives 25 per cent and the Great Northern 75 per cent. The same with the Milwaukee.

Q. Where is the interchange with the Milwaukee?

A. Spokane.

Q. Well, it is near Spokane?

A. Near Spokane.

Q. Yes; Marengo—or what is the name?

A. Plummer.

I have prepared a chart illustrating the divisions as made—showing the mileage, percentages, as well as the revenue divides. (3321.)

(Said chart was thereupon received in evidence, marked "Defendants' Exhibit No. 89, Witness Dodds.")

Q. (By Mr. SPENCER.) Have you any data prepared showing the interchange between the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line Railroad Company at Huntington?

A. I have nothing in statistical form, but I have available here the tonnage that we have received through Huntington for the years 1926 and 1927.

Exam. ROGERS. That would be westbound?

The WITNESS. Yes; from the Oregon Short Line and eastbound to the Oregon Short Line. The year 1926, the gross tons—the net tons received were 1,185,334. In 1927——

Q. (By Mr. SPENCER.) That is the net tons of commercial freight received by the O.-W. R. & N. Co. from the Oregon Short Line Railroad Company?

A. From the Oregon Short Line, yes; during the year 1926, at the Huntington interchange. And in 1927, 1,288,755. (3322.)
1827 The eastbound delivered by the Oregon-Washington Railroad & Navigation Company to the Oregon Short Line Railroad Company in 1926, was 1,654,797; and in 1927, 1,495,446.

The gross tons in 1926, westbound, including the empties, were 3,025,753; eastbound, 3,456,290. In 1927, westbound, 2,990,195; eastbound, 3,196,967.

Q. Have you taken the traffic estimate of Mr. Lounsbury and the expense items estimated for the operation of the cross-State line and prepared from them a study reflecting the result of the operation of the cross-State line?

A. Yes, sir; from Crane to Crescent Lake.

Q. You might explain how you arrive at this.

A. I used the revenue as indicated by our traffic department, that would be secured for this line if constructed; and for the expenses I used the average of the last three years' operation on the Crane line, considering that this would be a continuation of that line; the maintenance of way and structures being on a relative road mileage and the other expenses (3323) on a train mileage. I have also used the cost of constructing and equipping this line as given by engineers and computed the amount of return which is contemplated under the transportation act and have shown the result.

Q. Did you get an estimate for the taxes and for the passenger and mail and express business there?

A. I have freight revenue, passenger revenue, mail, express and baggage revenue; and also I have the taxes included, in addition to operating expenses.

The taxes were computed on the same basis we are now paying in the State of Oregon for branch lines, on an average rate of tax per mile of road, branch line, the State of Oregon. And this study that I now submit to you is the result of my analysis and application of the current rates and expense items.

1828 (Said statement, consisting of four sheets, was thereupon received in evidence, marked "Defendants' Exhibit No. 90, Witness Dodds.") (3324.)

Q. (By Mr. SPENCER.) Is this the first year of operation?

A. It is supposed to be an average year, because you notice the revenues are based on the revenues of the last five years' estimate by our traffic department; also by using the operating expense average for the last three years of the Ogden Eastern, it gives you an average operating expense after the line has been under operation.

Q. Your net operating income would be in red figures, or reflect a deficit of $281,519 in a year?

A. Yes, sir; the net railway operating income; that is, deducting operating expenses and taxes from revenues would result in red $281,519.

Exam. ROGERS. Can you tell me, Mr. Dodds, without too much trouble, how many times the traffic on which this estimate was based would have to be increased in order that the line might earn what you deem a fair return?

A. Well, that involves the increased expense which may result as a result of the increased traffic. It all depends on what they will say in regard to maintenance, after listening to Mr. Manson here, and as to the condition of his line from a maintenance standpoint, and having used the maintenance average of that line, you see, that is involved. Also you will have increased train costs naturally. (3325.)

Q. (By Mr. SPENCER.) Well, increased facilities of all kinds, and increased fuel?

A. Yes, sir; and if your traffic increased possibly there will be an increase in——

Exam. ROGERS. Would there be any factor you could apply that would even approximate it?

1829 A. No, I could not, without some one outlining to me, that is from the operating department, as to what will be involved by them through this additional traffic. Basing it on our own operation, it would have to be increased a very large extent.

Cross-examination:

I could not tell you off hand the number of branch lines the O.-W. R. & N. Company has but there are quite a number; about half of our mileage is branch lines. (3326.) We have a few in Idaho and quite a mileage in Washington and Oregon as well.

The auditing department of the O.-W. R. & N. does not keep currently statements substantially in the form of Exhibit 83 for its various individual branch lines. This exhibit 83 was made up specially on this basis for use in this case. I may say, however, that for the Deschutes we have kept account of certain expenditures there currently on account of it being a separate corporate company. On Exhibit 83 the revenues and expenses were allocated to the Des Chutes Railroad Company on the following basis: The local traffic is on a mileage pro rate, allowing the Des Chutes line a constructive mileage of 1¼ mile for each mile of its service, a minimum of 25 per cent (3327) to the line performing the short haul and the local rates as the maximum for either line.

On all freight inter-lined, to and from stations on the Des Chutes line, it is allowed an arbitrary in excess of the rate to Sherman, subject to minimum proportions, as stated, of five cents to

1830 points west of the Nebraska-Wyoming line per hundredweight, and stations south of Maupin and Nebraska-Wyoming line ten cents; that is for 1918. For later years we have used from Freebridge to Maupin and points west of Nebraska-Wyoming line 6.9 cents, and for south of Maupin and points west of Nebraska-Wyoming line 14.1. That is the allocation of freight revenue. I allocated operating expenses as follows:

Operating expenses are actual, as near as possible, with the exception that there are some expenses which it is necessary to pro rate. For instance, you have your road master, who has a joint territory; we divide it on road miles, and the other supervisory expenses on road mileage of the division. And general office expenses applicable to the line are assignable on the basis of the road mile that this branch bore to the total road mile of the entire line, under maintenance of way. Under maintenance of equipment we use the different rates according to the expenditure. For instance, freight (3328) train car repairs we allocate on the basis of the relative freight car miles, revenue freight car miles, and the same principle for locomotive repairs and passenger.

Now on the lumber business from Bend, take a car of lumber from Bend moving via the Des Chutes Railroad to Sherman and thence

east over the Union Pacific system to Omaha, the terminal expense at Bend involved in the origination of that traffic would be covered in transportation expenses—rail line on sheets 5 and 6 of this exhibit. That entire terminal expense is charged as an operating expense against the Des Chutes Railroad Company. That entire terminal expense would not include the cost of bringing an empty car west to be loaded with pine lumber. It would only include such train expense as would be incurred in the case of the train coming down to Sherman on the branch. Sherman is the junction point on the main line.

1831 Q. So, as I understand you, any part of the cost of moving an empty from the East to Bend would be that part of the cost of moving the empty from Sherman down to Bend? (3329.)

A. Yes, sir; in the train.

Q. But the entire terminal expense involved in the origination of such car of lumber, apart from the empty car haul, as you described it, would be chargeable to the Des Chutes Railroad Company?

A. Yes, sir. But on a car coming in there would be no terminal expense at the other end assessed against the Des Chutes. To explain my meaning, if your car originates on some part of the O.-W. R. & N. or one of the system lines, coming to a point on the Des Chutes, their terminal expense would not be assessed against the Des Chutes. There is nothing included here for that. But whatever terminal expense was involved in the handling of that car after it got to Bend would be charged against the Des Chutes Railroad. (3330.)

Referring to Exhibit 90, I did not make any calculations for results of operation of the proposed cross-State line after the first year; this was an average year as I explained it awhile ago. This isn't the first year; it is the revenue of the fifth year with the average expenses based on the last three years of the Oregon Eastern. It isn't for the first year or for the tenth year. It is a year's operation after the line has been in operation using the fifth year revenues as given by our traffic department. So that the combined estimates of our traffic and auditing departments would show this result for the operation of the line after it had been constructed and in operation for a period of five years.

I said the units of operating expenses used in Exhibit 90 were the average of those of the Oregon Eastern branch from Burns to Ontario; an average for the three years. (3331.)

1832 For the purpose of Exhibit 90 I took the total as estimated by the traffic department.

Q. Well, then, what basis of allocating operating expenses did you use for Exhibit 90?

A. For maintenance of way and structures I used relative road mileage. For the other expenditures I used train miles, using the theoretical train operation as described by Mr. Manson, and with one exception, and that was in regard to train dispatching; instead of taking the average I used the train dispatching costs which he said would be caused on account of re-arrangement of dispatchers. With

that exception, all of the accounts are based on those averages and bases.

Exam ROGERS. Well, did that re-arrangement result in placing against this line two additional dispatchers?

A. Instead of giving them the average which amounted, roughly (3332) speaking, I think, to around $2,500.00, it raised it to about six thousand two hundred—I think that is the figure for train dispatching—$6,240.00. That $6,240.00 is for the number of additional dispatchers which he stated would be necessary on account of this operation. I allocated all of that to the new line because it was an additional expense which was not incurred or acquired under the present operation.

Q. Referring to Exhibit 83, I note on the first sheet for this year, 1926, a net railway operating income deficit, $255,685.00. If you were to make up a similar statement following the same method with all of the branch lines of the Oregon-Washington Railroad & Navigation Company, in your judgment would—that is, for the same year—would any of the others have shown a net railway operating income in the red?

A. I couldn't say. I have never even considered it.

Q. Have you ever made up similar statements to this for any of the other branch lines of the Oregon-Washington Railroad
1833 & Navigation Company?

A. No, sir. (3333.)

I couldn't say whether it is within the realm of reasonable probability that if such statements were made up for some of the other branch lines that deficits would be discovered if the same method were used. I wouldn't like to answer without looking at the traffic and considering the conditions.

Referring again to the dispatching expense of $6,240 that is the average expense per year. (3334.)

On Exhibit 85 in the column headed "Total" and the sub-title headed "Cars" the figures are the sum of the four columns following to the right under the heading "Cars." The column headed "Forwarded from" would include (3335) traffic originated at a point north of Bend and moving to Sherman and then beyond Sherman. And "Received on" would be traffic moving on to the line but finding destination at some point north of Bend. "Local to" would be movement between Bend and Sherman to points intermediate. "Passing over" would be traffic moving from a point beyond Sherman clear to Bend or from Bend through Sherman to a point beyond Sherman or it could be where you turn it over to the Prineville Railway. None of those four columns duplicate each other at all.

Q. (By Mr. ELLIS.) On Exhibit 90 you have included and used as (3336) your investment figure the cost of constructing and equipping a main line railroad such as Witness Buck set out in his exhibit, have you not?

A. I don't know as to whether he set it out as a main-line railroad. This is the figure that he used in his estimate of construction of this line.

Q. Then the result that you get is one where you have applied revenues from purely local traffic to a main line railroad?

A. The revenues that were used were those that were given to this line as they were anticipated by our traffic department.

1834 Q. The interest and investment is the major item in the account, is it not?

A. It is the largest single item.

Q. Is it not true that if the line should cost no more than nine million dollars to construct, as Mr. Newell has estimated, the difference in investment would practically wipe out the deficit that you show here?

A. Oh, no; I have a deficit without including any interest. You see, there is a deficit here from your operation of $281,519.00.

Q. Well, it will practically wipe out that investment, not considering your interest on investment?

A. No; because your interest is additional, no matter on what basis you figure on, whether it is nine million or twelve million.

Exam. ROGERS. If there would be no interest at all you would (3337) have still two hundred eighty-one thousand in the red?

A. Yes, sir; if the road cost you nothing it would still cost you that.

Mr. SPENCER. You pretty near have it now—you are pretty low, aren't you?

A. Yes, sir.

Mr. ELLIS. Exhibit 86, showing hay tonnage, doesn't purport to show all of the hay traffic into western Oregon, does it?

A. No, sir; this is just what originated on the lines of our company.

1835 F. N. FINCH was thereupon called as a witness on behalf of defendants, and having been duly sworn, testified as follows: (3338.)

Direct examination:

I am general superintendent of the Union Pacific system, O.-W. R. & N. unit, Portland, Oreg. I have been operating the Oregon-Washington Railroad & Navigation Company lines since August, 1921, as general superintendent, and in October, 1918, as assistant general manager and assistant general superintendent. I operate approximately 2,051 miles; about 2,200 including my joint operation. That includes the joint operation north, Mr. Spencer. I have got about 2,200 miles.

The standard of my railroad, the main line between Portland and Huntington, is maintained to Union Pacific standard for main-line construction and maintenance. As to what is the capacity of the Oregon-Washington Railroad & Navigation Company main line, whether it is operated now to its capacity, or whether it isn't: I

wish it were, but it most certainly is not. That question of whether an ultimate main line to handle the system traffic of the O.-W. R. & N. I think can best be illustrated by the fact that (3339) the traffic density of an operating division is not determined by the gross ton miles or car miles, but upon the train units moved over such section of track. The line between La Grande and Huntington is the most easterly operating district over which traffic to and from the East moves on the O.-W. R. & N. In October, 1926, the heaviest month of that unusually heavy year, we moved an average of 4.7 freight trains in each direction per day between La Grande and Huntington. In the first 14 days of January, 1923, we moved an average of 7.8 freight trains in each direction per day in this same territory,
1836 and this same movement in 1923 required considerable more train and helper locomotive miles, because of lighter power, than we now use. This traffic, however, was moved without difficulty, and had power been available and the necessity existed we could have without great trouble moved more than double the number of trains actually handled, therefore, the train movement now being made on our system main line between Huntington and La Grande is at least less than one-fourth of the train capacity of the railroad, and the question of double-tracking or of alternate main line is one far in the future.

In connection with this, in the first 14 days of January, 1923, we averaged 2.991 locomotive miles in that 100-mile district, and in October, 1926, we averaged 1,546.5 locomotive miles per day. (3340.)

Now, that wasn't done with a lesser amount of traffic moved per day. For the first 14 days of January, 1923, our average gross ton-miles per day on that hundred miles distance was 2,370,754, and per day for the month of October, 1926, 2,411,880, or a slightly greater gross ton mileage with practically half the locomotive mileage.

I selected that period of the first 14 days of January, 1923, for the reason that that was the period in which the O.-W. R. & N. had made its greatest train movement, and thought that that would make the best comparison of handling approximately the same amount of traffic, to show what the railroad will stand in the way of additional traffic before it will be necessary to consider double-tracking for alternate main lines.

Q. What is the capacity of the railroad now as compared with that period, 14-day period, in 1923—I mean as to its physical
1956 condition or as to its power to accommodate and handle traffic? I mean by that, length of its sidings, double-track, if any, the improvement in ballast or rail—anything that will facilitate the handling of the tonnage? Can you comment on that in a general way for a moment?

A. Well, all of the passing tracks have been lengthened in that territory, the line has been completely reballasted, laid with 100-pound rail, bridges strengthened, and, of course, engines of greater

capacity added to our equipment list. You (3341) might say, relatively, that based on our old operation we could handle double what we did then, that is, just roughly, and based on our present improved operation we can handle four times what we handled in those 14 days, or what we handled in the heavy period of October——

Q. 1926.

A. And that is without going to double-tracking or building any alternate lines.

Q. The suggestion of the cross-State line in this case contemplates the proposal on the part of the petitioners to take a substantial part of the tonnage, of the westbound tonnage, produced by the 10 southwestern Idaho counties and divert it to this proposed cross-State line. What effect would that have on your operation through the Huntington gateway in connection with the Oregon Short Line, the westbound tonnage diverted to this line?

A. You say that—let me get that straight—that it is proposed that tonnage from southern Idaho which now moves to Portland is to be diverted over this circuitous route through Eugene to Portland?

Q. Yes.

Mr. ELLIS. No; that wasn't the proposal at all, Mr.

1838 Spencer.

Mr. SPENCER. Well, it is across the route toward Eugene there, to Crescent Lake, the terminus, so it can go to either California or Portland, and I am asking you the effect it (3342) would have on your interchange there at Huntington.

A. Well, of course, any loss of westbound traffic is a very serious thing to the Oregon-Washington Railroad & Navigation Company. We have losses enough as it is, and more than enough, as a result of the Panama Canal, and any additional westbound traffic that is taken away from us is just merely—well, to put it gently—robbing us of traffic that we should have towards reaching an equilization in our traffic movement, our eastbound business preponderating, and, therefore, any loss of westbound traffic, which is already light, would mean an extremely serious thing to the railroad.

Q. Would that cross-State line so we could form an alternative route to the O.-W. R. & N. to go to Portland or—of course, it doesn't get into or connect with your rails at Bend or elsewhere—but the suggestion is made that it might be an alternate route for you. What do you think about that?

A. I can't conceive of anyone routing traffic around that way, an additional distance, and involving connections with a foreign company. If you refer to livestock that Mr. Manson testified about, why, of course, if the traffic moved in sufficient volume in both directions that should be done, but after a great many years we have built up a service on livestock to the north Portland market that shippers, commission men, and packers all unite in saying is first-class service, and

we have done that by doing as Mr. Manson says, taking the (3343) stock which originates on the Oregon Short line and arrives
1839 Huntington within 12 hours and loading it and running that straight through to Portland without stopping for feeding enroute, the other stock leaving Saturday morning and after feeding at Hungtington coming through.

There is also some advantage to the stock business in that route, in that coming west over our line our freight line diverges at Troutdale and comes down through Peninsula Junction, or Kenton, which is only 1.2 miles from the north Portland yard. Now, if they ran that stock via Eugene with the idea of diverting, it seems to me that they would run against the possibility that in shipment either the shipments left to move to Portland or to move to California would be inadequate to justify special service. In addition to that, after the stock arrived at Brooklyn, the Southern Pacific yards, you would have a switch movement of approximately 4½ miles to reach our Albina yard, and then 4 miles from Albina yard switch movement out to Peninsula Junction, on top of the 1.2 miles switch movement to the yards, and it doesn't seem to me that the stock would move via that route and make it through to the yards within the 36 hours which we now give it, and that consequently would have to stop and feed enroute.

Q. As I understand you, your freight line business from the north—or to or from the north Portland stockyards doesn't go into your Albina terminal at all? (3344.)

A. Not with stock. The switch engine meets the train at Peninsula Junction, the road engine cuts off and the switch engine couples onto it and goes up that mile and two-tenths and shoves that stock into the chute, and there is practically no terminal delay on the stock at all.

Q. And is that true as to all livestock that goes into those yards——

1840 A. Yes, sir.

Q. That goes north into Seattle?

A. Well, the Seattle stock, Mr. Spencer, very little of it feeds at North Portland. Most of the stock moving west from the Idaho territory comes over the—for Carstens and Frye unloads at The Dalles, because for some reason they don't like to patronize the North Portland yards, and we move that stock in here and make an immediate connection to the north.

I do not know to what extent the yards are patronized by Puget Sound buyers in the purchase of stock. Of course, I know that they patronize it a good deal, but on certain of the stock these people want to unload it at The Dalles—I imagine in connection with feeding the animals and then getting a through run—rather than bringing them into Portland then feeding them.

Q. It has been suggested here, or perhaps positively testified—I don't know how Mr. Wiggins intended it—the contention (3345)

was made that this operation through Crescent Lake might be economical and advantageous because of the expense and delay in putting traffic through your terminals at Portland, and because of the congestion that obtains at your terminals at Portland. Is there any congestion in your terminals? How extensive are your terminals, and what areas have you got here to permit of expansion, if you have any?

A. Well, I will say first that we have almost unlimited expansion in our Albina district. We haven't tracks on half the land that we have there. The Albina yard district has a capacity of 2,000 freight cars, and the Portland terminal, in which the Oregon-Washington Railroad & Navigation Company is a joint user, has a car track capacity of 1,020 cars. Then out of terminal No. 4, the mu-
1841 nicipally owned port, is a track capacity of 250 cars. As to whether I operate that, it is operated by us for the joint account of the S. P. & S. and its parent companies and the O.-W. R. & N. The matter of congestion, Mr. Spencer, isn't a matter of yard tracks. That is a matter of power and crews to move the through business. I don't believe that for years there has been any delay in the movement of through traffic on the O.-W. R. & N., and that is due to the fact that we have adequate power and crews at all times to move the business, and as fast as a trainload accumulates it is run. (3346.)

Now, so far as our Albina terminal is concerned, of course, it is necessary to have set aside at all times a certain number of live or train yard tracks upon which your outgoing and incoming trains are broken up and made up. Unfortunately for the O.-W. R. & N., its volume of business is not sufficient to keep the live tracks and train yard tracks fully occupied, and we could handle a very considerably increased traffic through the Albina terminal in the way of through business without having to add a foot of trackage or without causing any delay whatsoever. (3347.)

Cross-examination:

Q. (By Mr. ELLIS.) Mr. Finch, the testimony you have given with reference to livestock traffic relates solely to the movement of livestock traffic to Portland, does it not, and you didn't have in mind the movement of livestock from southwestern Idaho to San Francisco?

A. No; as I understood the question, Mr. Ellis, it was a question of whether this stock that now moves to Portland from Idaho might be diverted to route over this assumed cross-State line and throw that traffic which now moves to Portland—a part of it be diverted to go to California and part of it moved here. I didn't understand that it referred to any increased business.

1842 Q. You are not questioning in your testimony any advantage that might accrue on livestock moving to San Francisco over (3348) a shorter route than the present route through Ogden or through Portland?

A. Well, I don't know anything about the distances from that territory to San Francisco. I am just discussing the inadvisability of routing stock shipments that way that would ordinarily go to Portland. In other words, the service on the stock which ultimately came to Portland through that gateway would not be as good as the present service to Portland.

Q. You will recognize, however, that there would be some compensating advantages in having two markets available until the shipment reached Crescent Lake, would you?

A. Well, I don't know that I would admit it; no. As to whether it would be largely a matter for the shipper who is selling the livestock to determine whether the disadvantages that I say would exist might be outweighed by other advantages in the way of markets made available, why, they might figure that way, Mr. Ellis, at first; but I don't believe from my experience in handling the stock and meeting the shippers that that arrangement would continue very long. In other words, I don't believe that they would be satisfied to route that way on the bare chance that they might transfer to the Frisco market. In these days of quick advice as to market conditions it seem to me that the man who (3349) wanted to ship to Frisco would have his mind pretty well made up before he started to ship.

Q. Have you ever had any experience in marketing livestock?

A. Well, not for a great many years, but I did as a young man.

1843 Q. Would you concede, Mr. Finch, that the per car cost of handling traffic through a terminal the size of Portland would be any different from that through a terminal the size of Eugene?

A. Not at all as to the through traffic. As to whether there would be some difference as to local traffic, there would be as to traffic which had a destination at that terminal, but not as to traffic moving through the terminal. For example, you understand, Mr. Ellis, at a point like Eugene the movement to reach every industry is only a very short distance, whereas at a point like Portland your freight which arrives to be delivered to a consignee is apt to move from six to eight or nine miles in going from the break-up yard to the destination, but so far as a car coming into Portland in a train and going out from Portland in a train, the cost, if anything, would be less in a large, well-organized terminal, where you have no dead time of your switch engine and crew.

Q. Well, would you say that the handling of those local cars which you say must be switched great distances would in no way affect the through traffic moving through the terminal? (3350.)

A. Not at all. Not at all.

We don't have a hump in the Portland yards. We don't have sufficient business to justify one.

I think I was with the Northern Pacific at the time the cross-State line was first projected.

As to how much additional traffic might be economically handled over the existing single track of the Oregon-Washington Railroad & Navigation Company, from the standpoint of practical opera-
1844 tion, I think we could very easily handle four times what we are handling, and, of course, the greater the volume of traffic up to a given point the cheaper becomes your operation. I am not going to say at what point I would reach the maximum of economy, because I haven't yet found the man who could tell you that, and I certainly can't do it. You know it when it occurs.

Q. Would a second main line located through central Oregon along the route of the cross-State line be of any value as an auxiliary line in the event of no conditions or other emergencies along the present route?

A. Why, I don't know enough about that territory, but the snow (3351) trouble on the Oregon-Washington Railroad & Navigation Company is really rather infrequent. Only twice in the ten years that I have been there have we had any snow trouble that interferred to the slightest extent with the movement of traffic, and in connection with your question about alternate main line I would like to point out to you, Mr. Ellis, that it is a great deal cheaper to maintain a second main line or double-track than it is to maintain an alternate main line to move the same traffic.

Q. But would it be as useful in the event of snow difficulties or other emergencies which block your main artery, such as might exist, or such as existed along the Columbia River?

A. No; that is getting so far into the fancied possibility of trouble, and I know nothing about the territory—I don't know, you see, but what they may have more snow down there going across from Eugene over to Crescent than we have on our main line, so I am really not qualified to testify.

Q. Whenever your main line is blocked by snow or other emergency conditions in the Blue Mountains, what other routes of traffic have you to handle your trains into Portland?

1845 A. In the ten years that I have been with the Oregon-Washington Railroad & Navigation Company we have never been delayed to exceed ten minutes on any train on account of snow in the Blue Mountains. (3352.) As to other points on our main line, we have down here in the Columbia River Gorge twice, and in that case the Spokane, Portland & Seattle one of the years was immediately available to us as an alternate route; the other year they also had some similar trouble.

The question of snow removal is an important one in the operation of the Oregon-Washington Railroad & Navigation Company lines at the present time; it is an item of expense. And if snow conditions are less severe on the proposed cross-State line than on our existing route, that is not a factor worthy of some consideration in an expression of this kind, when you are considering the question of additional expenditure of money. It wouldn't represent a drop in the bucket. I mean that in connection with our expenditures in main-

taining a line of railroad through the State of Oregon, our snow conditions, cost of snow fences, cost of snow removal, are insignificant in comparison with the cost of maintaining an alternate main line, in comparison with the cost of maintaining an adjoining double track. In other words, they figure that it costs about 60 per cent to maintain that double main track of what it costs to maintain a single main line in equal condition. With an (3353) average cost per main line mile for maintenance in a year of about $3,600, the difference in that of a few miles of railroad would make your cost of removing snow practically insignificant.

The Oregon-Washington Railroad & Navigation Company has not constructed any double-track between Huntington and Portland since I have been with the railroad. They have double-tracks
1846 from Crates to Biggs, of about 21 miles, which goes through The Dalles; and then there is about six miles on top of Kamela Hill.

Q. Well, can you explain why it was necessary to double-track those sections, if your present line isn't making anywhere near capacity?

A. Well, I dislike to comment on that. It was absolutely, in my opinion, unnecessary.

Q. But the officers of your company spent many thousands of dollars in doing it.

A. Well, of course, mine is after-thought. On the basis of their operation as they then operated, with the class of power and other conditions, they may have figured without conceiving the development of the steam locomotive that that double-track was necessary. I wasn't here and don't know when the idea was conceived, but that may be the answer; but on the basis of our present operation the double track is not necessary. (3354.)

Q. Would your judgment be the same with reference to the double-trackage on the Oregon Short Line, concerning which Mr. Manson testified?

A. I have no knowledge whatever of the details of the Oregon Short Line operation. I don't know how the traffic compares between the Short Line and the Oregon-Washington Railroad & Navigation Company.

Q. (By Mr. McCulloch.) Mr. Finch, in addition to its existing traffic, in your judgment, could the O.-W. R. & N. handle efficiently all of the western Oregon traffic via Portland that now moves via Roseville?

A. I have no figures as to what that traffic amounts to, Mr. McCulloch.

Q. Do you know whether the Southern Pacific's line to
1847 Ogden from Roseville is operated more nearly to capacity than the Oregon-Washington Railroad & Navigation Company's line from Portland to Huntington?

A. You mean from Roseville east?

Q. Yes.

A. Well, I don't know as to its capacity. I know that they handle a very much greater traffic east from Roseville than what we handle over the Oregon-Washington Railroad & Navigation Company. (3355.)

I don't know whether it is a larger per cent of its capacity than our traffic constitutes of our line's capacity. That would require a study, and I presume they can give you witnesses that can tell you what their capacity is.

Exam. ROGERS. Mr. Finch, as I understood, they figure that the traffic wouldn't amount to more than five or six trains a day.

A. Yes, sir; if that is all, we could handle five or six more trains a day on our railroad without any trouble whatsoever, in each direction, freight trains.

Exam. ROGERS. That is the question Mr. McCulloch asked you about the Roseville traffic—if it didn't amount to more than five or six trains a day you could handle it through Portland without any trouble?

A. Yes, sir.

Q. (By Mr. MCCULLOCH.) I was going to ask you what differentiated the situation as far as having the additional route across the State by the construction of this proposed cross-State line in Oregon—assuming that the Union Pacific system built that line
1848 and had that additional route across the State—from the situation in California, where across the State from east to west the Southern Pacific has two routes, the Roseville route from Roseville to Ogden, and the Sunset route in (3356) the southern part of the State.

A. I have been so busy trying to run my own railroad that I know nothing about the Southern Pacific, Mr. McCulloch.

I selected the division between La Grande and Huntington to figure the capacity because that is the last district east to Huntington over which our eastern business moves. Our particular road ends at Huntington, and everything running to the east, no matter where it originates, does move over that district, whereas if you took the district on this side, the La Grande district, and the Joseph branch district, and the Baker district wouldn't have moved over that district to and from the east.

The division across the Blue Mountains is not the most difficult operating division and the capacity is not less there than on the La Grande division. Our trains have the same rating from Rieth to La Grande and La Grande to Rieth that they have from La Grande to Huntington.

We use helpers in both territories. There are two helper districts in the territory between La Grande and Huntington, and one helper district between La Grande and Rieth. In other words, we have two hills between La Grande (3357) and Rieth, the first one being 1½ per cent adverse eastbound, 1 per cent adverse westbound, and a second hill out of Baker 1½ per cent adverse eastbound and 2.2

adverse westbound, whereas in the Blue Mountains, so-called—these are all spurs of the Blue Mountains that we cross over there, but the main ridge of the Blue Mountains we have one helper district 2.2 in each direction. That is just west of La Grande. The
1849 length of the hill from Baker up to Encina is about 11 miles.

I have never been to Crescent Lake. I might state it is very seldom I get off of my own right-of-way. Assuming that the snow there reaches a depth of ten feet for a considerable period in the winter, and that the temperature is down to zero and below and an altitude of about 4,500 feet (3358), I most certainly would not consider that a very favorable situation for interchange, and if they have such snow as that they have much worse conditions than we have on the O.-W. R. & N.

(Witness excused.)

Mr. SPENCER. I have some questionnaires and answers propounded to Mr. W. B. GREELEY, U. S. forester formerly, and now manager of the West Coast Lumbermen's Association. Mr. Greeley was subpœned to come, the subpœna having been issued by Commissioner Meyer at our request when the case was first set, but his calls were such that the counsel for the petitioners agreed that we could read the questions and answers resulting from the correspondence I submitted to them into the record and introduce these exhibits as a deposition. (3359.) They are exhibits, most of them, that I wanted to introduce, but I think perhaps the questionnaire should be read here, and then I can introduce the exhibits with it.

Comr. MCMANAMY. That is agreeable to counsel? Proceed.

Mr. SPENCER. The following are the questions and answers submitted to Colonel W. B. Greeley and by agreement of counsel to be received as a deposition in this case:

"Question. Please state by years the amount of softwood lumber produced in Oregon, Washington, and Idaho respectively during the years 1923 to 1927, inclusive.

1850 "Answer. Tabulation attached, marked 'Q. 1 and 2' give the required information as to Oregon and Washington softwood (3360) production, no such detailed data being available in our files as to Idaho." I now present these questions one and two as an exhibit.

(Said paper was thereupon received in evidence, marked "Defendant's Exhibit No. 91.")

Mr. SPENCER. Question 2. "Please classify the foregoing as between fir, pine, and 'other species.'

"Answer. Tabulation attached, marked 'Q. 1 and 2' give the required information as to Oregon and Washington softwood production, no such detailed data being available in our files as to Idaho."

"Question 3. State approximately and by years the percentage of this production that has been transported by water and rail respectively.

"Answer. Tabulation attached, marked 'Q. 3,' answers this question." (3361.)

(Said tabulation was thereupon received in evidence, marked "Defendant's Exhibit No. 92.")

Mr. SPENCER. "Question 4. To what markets did it move?

"Answer. Tabulation attached, marked 'Q. 4,' answers this question." (3362.)

Q. 4 embraces graphic charts, lumber distribution from Oregon and Washington, and also the detail by the West Coast Lumbermen's Circular No. 4618 of April 23, 1928, consisting of some five pages.

Exam. ROGERS. What is the West Coast Lumbermen's Association, Mr. Spencer?

1851 Mr. SPENCER. The West Coast Lumbermen's Association is an association of all the mills west of the Cascade Mountains—not all of them, but largely comprising the mills, substantially all the mills, west of the Cascade Mountains, as I understand it. I think that—doesn't Mr. McCulloch appear for them in this case? You know that association better than I do.

Mr. MCCULLOCH. Yes; Mr. Spencer stated it correctly. They are the principal mills, and represent about 85 per cent of the fir lumber produced in Oregon and Washington.

Comr. MCMANAMY. Do they include the Willamette Valley Lumbermen's Association?

Mr. SPENCER. Quite a number of the members of the Willamette Valley Association are members, and have been for years, of the West Coast Lumbermen's Association.

Mr. LOUNSBURY. The larger mills.

Mr. MCCULLOCH. Yes. (3363.)

Mr. SPENCER. Chart of the United States, compiled by the West Coast Lumbermen's Association, Seattle, and chart of lumber distribution from Oregon and Washington, and tabulations by districts as compiled under Circular No. 2618, comprising five pages, introduced as one exhibit.

(Said papers were thereupon received in evidence, marked "Defendants' Exhibit No. 93.")

Mr. SPENCER. [Reading.] "Five. Q. Has there been any failure on the part of the railroads serving these three States to move the lumber in question tendered to them for shipment with reasonable dispatch during this period since 1922?

"A. No.

"6. Q. What lumber milling operations of importance have been established in these three States since 1922?

1852 "A. In Oregon and Washington: Large operations:

"Long-Bell Lumber Company, Longview, Washington; Oregon-American Lumber Company (Central Coal & Coke), Vernonia, Oregon.

"Medium operations, daily: Washington Lumber & Spar Company, 125,000 feet; Henry Mills & Timber Company, 80,000 feet;

The Reed Mill Company, 125,000 feet; Henry McCleary (3364) Timber Company, 225,000 feet; Weyerhaeuser Timber Company (Mill C), 150,000 feet; Columbia River Paper Company, 125,000 feet; Western Lumber Company, 100,000; total, 930,000 feet.

"In Idaho, Clearwater Timber Company, Lewiston, Idaho.

"7. Q. What is the daily or annual production capacity of each of said mills?

"A. Long-Bell Lumber Company, 1925, 235,000,000 feet board measure; 1926, 344,000,000 feet board measure; 1927, 420,000,000 feet board measure; daily capacity, 850,000 feet board measure.

"Oregon-American Lumber Company, 1925, 134,000,000 feet board measure; 1926, 153,500,000 feet board measure; 1927, 141,200,000 feet board measure; daily capacity, 300,000 feet board measure.

"Clearwater Timber Company not operating in 1927, daily capacity per 8-hour shift said to be 400,000 feet board measure. (Four L News, August, 1927.)

"Others—answered in question No. 6.

"8. Q. What lumber mills are now in process of construction in these States and what is the production capacity of each?

"A. Weyerhaeuser mill now under construction at Longview, Washington, with estimated daily capacity per 8-hour shift of 750,000 feet board measure. (3365.)

1853 "9. Q. Do you know of your personal knowledge or by public pronouncement of any lumber mill or mills of large producing capacity about to be constructed?

"A. Weyerhaeuser mill at Klamath Falls, Oregon, with estimated daily capacity of from 250,000 to 275,000 feet board measure. (West Coast Lumbermen, June 1st.)

"10. Q. What is the capacity production of same?

"A. Same as question No. 9.

"11. Q. To what percentage of capacity are the lumber mills in Oregon, Washington, and Idaho operating at the present time?

"A. Approximately 80 per cent—Authority, A. D. Davis Statistical Bureau.

"12. Q. How many of them have shut down or suspended operations?

"A. Since June 1st, 1924, 24 mills in western Oregon and Washington have suspended operation for various causes, such as fires, failures, depletion of timber, etc. These 24 operations had an approximate daily capacity of 3,295,000 feet.

"13. Q. Has the supply of softwood lumber in the United States during the past five or six years been in excess of the demand therefor?

"A. Yes; at least as to demand at prices sufficient to permit profitable manufacture. (3366.)

"14. Q. Has the lumber manufacturing business been in a depressed condition during recent years—and what is its present condition?

"A. Yes. Industry now depressed.

"15. Q. For several years last past has the lumber manufacturer in these three States been operating at a fair profit, and what is the fact in this regard at the present time?

1854 "A. Average lumber manufacturer in the Douglas fir region has been and is now operating without profit.

"16. Q. Is it not a fact that speaking generally for several years last past the timber in these States has been out, manufactured and marketed at no substantial profit to the manufacturer?

"A. Yes.

"17. Q. Do you consider that market conditions now obtaining or in prospect for the next few years warrant the construction of more lumber mills in the States of Oregon, Washington, or Idaho?

"A. No.

"18. Q. In your opinion will the interests of these States or of the United States or of individuals as owners of timberlands in these States be served to advantage by the construction in the near future of mills of substantial capacity for the manufacture of lumber? (3367.)

"A. Not under present market conditions, except as financial interests of individuals may require mill construction to liquidate timber investments.

"19. Q. Save and except for an occasional spur or branch line that may be or become necessary to build into the timber from some existing railroad for movement of logs, is there any necessity in your opinion for the construction of additional railroad or railroads in these States in order to transport with reasonable dispatch the lumber that will be tendered for shipment by rail during the next few years?

"A. Not from the standpoint of the present total volume. Additional facilities may be required to keep pace with the shifting location of lumber production.

1855 "20. Q. To what extent has the production of pine in the southern pine belt in the South Atlantic and Gulf regions decreased since January 1st, 1923?

"A. Annual production of yellow pine:

"1923, 12,948,687,000 feet; 1924, 12,486,590,000 feet; 1925, 13,235,936,000 feet; authority, Table 55, Statistical Bulletin No. 21, U. S. Department of Agriculture.

"1926, 13,000,000,000 feet; 1927, 12,000,000,000 feet; estimate made by the Southern Pine Association.

"21. Q. Has this decrease been as large as anticipated by you when your letter of December 4th, 1922, was written?

"A. No. (3368.)

"22. Q. What elements have entered into the business causing a larger continued production by the southern pine mills than you anticipated?

"A. Mainly, numerous small mill operations in second-growth yellow pine, farm wood lots, and small holdings of old-growth timber.

"23. Q. Would you venture an estimate now of the approximate date when the southern pine forests will be exhausted to an extent that will not permit the southern pine mills to export in substantial volume from the States in which they operate?

"A. No. The best estimates available indicate that the out of southern pine may decrease to about ten billion feet in 1928 and nine billion feet in 1929, and that it appears probable that the cut of southern pine will become relatively stable at about six or seven billion feet annually for some time to come.

"24. Q. Please name the States wherein the southern pine is manufactured in substantial volume.

1856 "A. In order of production importance; Mississippi, Louisiana, Alabama, Texas, Arkansas, Georgia, Florida.

"25. Q. Please state by years since 1922 the annual consumption of softwood lumber manufactured in the United States.

"A. This question is understood to refer to annual production since the following question (26) deals with consumption. (3369.) The following is therefore information on production:

"1922, 26,644,334,000 feet board measure; 1923, 30,903,981,000 feet board measure; 1924, 29,405,685,000 feet board measure; 1925, 31,710,478,000 feet board measure; source, Table 55, United States Department of Agriculture Bulletin No. 21.

"26. Q. How much of this has been consumed in the United States?

"A. 1922, 24,789,331,000 feet board measure; 1923, 28,259,334,000 feet board measure; 1924, 26,390,999,000 feet board measure; source, Table No. 67, United States Department of Agriculture Bulletin No. 21.

"1925, blank; 1926, 27,357,464,000 feet board measure; source, Bureau of Railway Economics Bulletin No. 30, June, 1928.

"27. Q. From what sources of manufacture has the export and domestic demand been met?

"A. Principally from the Pacific coast and southern pine groups."

Exam. ROGERS. Now, is this man giving figures based on Bureau of Railway Economics?

Mr. SPENCER. One item in 1926. The others are from the Department of Agriculture, and one figure was given taken from the Southern Pine Association.

"Q. To what extent have substitutes for lumber displaced its use since 1922? (3370.)

1857 "A. In connection with this question there is sent under separate cover a pamphlet entitled 'What's the Matter with the Lumber Industry.' Please be referred to chart on page 49 which is probably the most tangible answer to the question it is possible to formulate. While this chart indicates that the actual loss in lumber used in comparison with 1909 is approximately ten billion board feet, assuming that the use of lumber had remained stationery at the 1909 level, the probable loss of markets to lumber due to the use of other materials is undoubtedly greater than ten billion board feet." (3371.)

Mr. SPENCER. The last question was, "To what extent have substitutes for lumber displaced its use since 1922?" I think I completed the answer to that. I did.

The witness, or the pamphlet to which he refers, entitled "What's the Matter with the Lumber Industry," was received, two copies, or three copies, and I prepared from same the charts set forth in those pamphlets, commencing with page 22 and to page 63, and I think they are all in there. In any event, the copies that I desire to introduce from it are bound and now we present them as exhibits in connection with Colonel Greeley's testimony, photographed from the publication.

(Said book was thereupon received in evidence, marked "Defendants' Exhibit No. 94.")

Mr. SPENCER. The letter to which the interrogatories referred accompanies the correspondence submitted to counsel, and is, therefore, submitted to be read or incorporated in the record. It reads at some length, bears date December 4th, 1922, and is addressed to Mr. J. M. Devers, Assistant Attorney General of Oregon, to the Lafayette Hotel, Washington, D. C., under that date, signed W. D. Greeley, Forester U. S. Forestry Department. (3372.)

1858 (Thereupon said letter was read into the record as follows:)

[Copy]

December 4, 1922.

Mr. J. M. DEVERS,
Lafayette Hotel,
Washington, D. C.

DEAR MR. DEVERS: I am writing you to confirm our conversation on December 2nd, regarding the extension of transportation facilities in the State of Oregon. I am not qualified to form any judgment regarding the issues involved in the present hearings before the Interstate Commerce Commission. Without knowing how it may affect these specific issues or whose contentions it may support, I wish to say that the enlargement of the facilities for shipping Oregon timber, by rail or by water (3373), to the central and eastern lumber markets of the United States is a matter of very great necessity.

During the last 25 years, the main source of softwood lumber for general construction, house building, and industrial uses in the greater part of the Mississippi Valley and the States to the east of it has been the southern pine belt in the South Atlantic and Gulf regions. The production of lumber in these regions passed its peak about 1916 and is now gradually decreasing from exhaustion of standing timber. A survey made by the Forest Service in cooperation with lumber manufacturers in 1920, covering 5,400 sawmills in the southern pine region, showed that over 97 per cent of them will cut-out their timber by 1930, with a reduction in the output of this group of mills aggregating 78 per cent. Every year that now

1859 passes witnesses the dismantling of a considerable number of these mills; and much of the capital hitherto employed in

lumber manufacture in the south is now seeking new locations on the Pacific coast. An experienced lumber manufacturer of the south, after exhaustive study of the situation, made the estimate in 1920 that by 1930, if the consumption of lumber in the Eastern States does not materially decrease, it will be necessary to increase eastbound lumber shipments from the west coast to eastern markets to the extent of 11 billion board feet per year. This contemplates simply replacing the market requirements hitherto supplied from the pine forests of the (3374) South.

The only large supply of softwood timber now remaining in the United States is on the Pacific coast, including Alaska, and in the Columbia River Basin. The lumber manufacturing industry is now moving rapidly into this region, just as thirty years ago it moved from the region of the Great Lakes into the South. The demands for western lumber to supply eastern and central markets will, in my judgment, at least double within the next ten years. With the most rapid development of transportation facilities that can be expected, I anticipate that there will still be a serious congestion of eastbound lumber shipments from this region, more or less chronic, which will affect adversely the interests of the lumber consumers of all classes in the Eastern States. As a broad question of public policy, I believe very strongly that every reasonable effort should be exerted to increase transportation facilities from the principal timber regions of the West to eastern markets. This, of course, includes water transportation as well as rail transportation.

1860 The State of Oregon contains an estimated stand of 494 billion feet of timber, or over 20 per cent of all the timber in the United States. Oregon ranks first among all the States in timber resources. In from ten to fifteen years Oregon is bound to become the leading State of the Union in lumber production. Its present rail facilities are in my judgment (3375) wholly inadequate to the production of forest products which the resources of this State ought support. I regard it as particularly important to see the resources of Oregon for water shipments of lumber to the Atlantic Coast increase and also to see additional outlets provided to the Willamette Valley and the pine regions of central Oregon for eastbound lumber shipments. The national forests of Oregon contain about 131 billion feet of standing timber. Our present yearly cut from these Government properties is 137 million feet of timber. The yearly cut from the national forests of Oregon could properly be increased to ten or twelve times the present amount, while still insuring the unimpaired perpetuation of the resource and utilizing only its current annual growth. It would be desirable from every standpoint to bring the cut from these national forests up to that amount, to utilize old virgin timber that is now deteriorating from decay, to increase public revenue for the Nation and State, and to afford an additional supply of forest products for the markets of the country. The possibility of increasing the cut from the national forests depends to a considerable degree upon the enlargement of rail facili-

ties. To this extent, the Government has a direct interest in the matter. The predominant consideration, however, in my judgment, should be the fact that the dependence of the entire country for softwood timber is rapidly shifting to the west coast, and that its existing rail (3376) facilities are inadequate to meet this
1861 growing demand.

Very sincerely yours,

W. B. GREELEY,
Forester.

Mr. SPENCER. The last question propounded is in that original manuscript. I don't have it here. But I asked him if there was any other matter he desired to explain to please do so, and he refers to this letter, with this statement, headed "Statement by Colonel William B. Greeley," July 9, 1928, and I can introduce that the same way in the record, or read it, as it may be desired.

Comr. MCMANAMY. If there is no objection it may be copied in the record.

Mr. ELLIS. There is no objection.

Mr. SPENCER. All right.

(Said statement was thereupon set out in full as follows:)

"Statement by Colonel William B. Greeley, July 9, 1928

"I must admit that my own viewpoint regarding the problems which you present has changed somewhat since my letter of Dec. 4, 1922, was written; and this change occurred prior to my leaving the U. S. Forest Service on May 1st, 1928.

"The conditions governing the marketing and use of lumber have been greatly changed on account of the use of other (3377) materials to an increasing degree. This has been reflected in a substantial drop in the per capita consumption of lumber in the United States since about 1910.

"The lumber industry in the Pacific Northwest was devel-
1862 oped primarily in the belief that the normal consumption of lumber in the United States under former standards would continue, while the production of lumber from other softwood regions would decline, as has been proved in the past history of many of the older manufacturing sections. These results have not been fulfilled to the extent anticipated when the industry was in the course of development on the northern Pacific coast. The markets for lumber have not expanded to the degree contemplated, largely because of the use of other materials than wood. At the same time the production of southern pine has not decreased as rapidly as was anticipated owing principally to the amounts of second growth timber in the South and the operation of numerous small mills.

"Because of these factors the lumber industry of the Pacific Northwest has experienced frequent periods of overproduction in relation to the demand at prices sufficient to permit profitable manu-

facturing. Such a period has prevailed substantially since 1923. The most important development for the lumber industry on the northern Pacific coast, as I see it, is to restrict overproduction of lumber as far as possible, manufacturing its products in a more orderly and effective (3378) relationship to the markets actually available.

"With the foregoing conditions in mind, it would seem to me inadvisable to increase the operating capacity of Oregon and Washington sawmills until the present situation has changed sufficiently to provide an assured market at prices permitting profitable manufacture, for a larger output of lumber.

"It of course goes without saying that the lumber industry of this region is more dependent upon railroad service and freight rates than that of any other portion of the United States for
1863 the marketing of its products at satisfactory returns. Any development that would result in reduced freight rates to the principal interior and eastern markets would be of utmost benefit to the lumber industry in this region. Furthermore in the course of time, as lumber production shifts from Washington to Oregon additional railroad facilities may be required to market efficiently the product of the new regions of heavy production."

Mr. SPENCER. That concludes Mr. Greeley's testimony.

Mr. DEY. I would like to ask the witness one question: What official position has Colonel W. B. Greeley held in the United States in the last several years?

Mr. SPENCER. Well, he was the Chief Forester of the United States Department of Agriculture, or Secretary of the Interior Department; I think he was connected with the Forestry Department of the United States. (3379.)

Mr. DEY. When did he leave that position?

Mr. MCCULLOCH. May 1st, 1928.

Comr. MCMANAMY. Have you any more witnesses, Mr. Spencer?

Mr. SPENCER. No. I have two or three exhibits I would like to introduce.

Mr. MCCULLOCH. That association has its principal office in Seattle, Washington.

Mr. SPENCER. I desire to offer as an exhibit in this case the testimony of Warren D. Smith, appearing in the former record in case No. 14,392, page 565, line 16, to page 574, to line 23, inclusive, with exhibit No. 24, which was referred to on the cross-examination of the witness Smith, and was an analysis of Alkali Lake by him. (3380.)

1864 (Thereupon the excerpt from testimony of Warren D. Smith and the copy of Exhibit No. 24 in Docket No. 14393 was received in evidence, marked "Defendants' Exhibit No. 95.") (3382.)

Mr. SPENCER. I also desire to introduce in evidence transcript of the testimony of T. H. Foley, taken upon the previous hearing of this case, Docket 14392, pages 603 to 624. Mr. Foley is dead, has died since the last hearing of the case.

(The transcript of excerpts from testimony of T. H. Foley given in hearing in Docket No. 14392 was thereupon received in evidence, marked "Defendants' Exhibit No. 96.")

Mr. SPENCER. I desire to introduce in evidence testimony certified to by the secretary of the Interstate Commerce Commission, from Finance Docket 2613, given by Witnesses C. J. Smith, C. F. Swigert, and H. H. Corey.

Exam. ROGERS. Relating to what?

Mr. SPENCER. Relating to the cross-State line and the character of the country traversed, given at a hearing in the so-called Central Pacific case before the Interstate Commerce Commission at Washington, D. C., in Docket No. 2613, in the (3383) matter of the application of Southern Pacific Company to acquire control by lease and by stock ownership of Central Pacific Railway Company, the original of which is now on file and of record in the office of the commission. (3384.)

(The certified copy of excerpts from testimony of C. J. Smith, C. F. Swigert, and H. H. Corey was thereupon received in evidence, marked "Defendants' Exhibit No. 97.") (3385.)

1865 Mr. SPENCER. I also offer in evidence from the previous record, Docket 14392, the testimony of A. R. Olsen, called by the petitioner in the previous case. (3386.)

(The excerpt of testimony of A. R. Olsen given in hearing in Docket No. 14392 was thereupon received in evidence, marked "Defendants' Exhibit No. 98.")

1866 GEORGE W. BOSCHKE was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am chief engineer of the Southern Pacific Company, Pacific system (3387), and as such I have active charge and direction of all new construction carried on by the Southern Pacific Company. I have been associated with the Southern Pacific Company and allied companies since 1886. Formerly, during the régime of the Harrison lines, I was chief engineer of the Oregon-Washington Railroad & Navigation Company and the Southern Pacific lines in Oregon at the same time.

The map you show me marked 21240 was prepared under my direction. It is a map of a part of Oregon, California, and Nevada, showing railroad development, dated July 7, 1928. The dotted yellow is the proposed cross-State line, I. C. C. Docket 19680; the solid red line, constructed Southern Pacific lines; the dotted red, proposed Southern Pacific line Klamath Falls to Alturas; dotted yellow and red, the Oregon, California & Eastern Railway; jointly owned by the Southern Pacific and (3388) the Great Northern; the solid yellow line of the Great Northern line from Bend to Chemult; the yellow crossed and red crossed is the Southern Pacific line Chemult

to Klamath Falls, used jointly with the Southern Pacific and the Great Northern.

(Said map was thereupon received in evidence, marked "Defendants' Exhibit No. 99, Witness Boschke.")

I know what the Alturas line, which has been referred to in the testimony in this case quite frequently, is. The so-called Alturas route is a line from Klamath Falls to Alturas, which would form part of a through line from Portland to Ogden, and in addition to the part from Klamath Falls to Alturas, the Nevada, California, and Oregon Railroad between Alturas and Wendel makes
1867 up the rest of the line from there on, and from Wendel on to Fernley, Nevada, the branch line, the Fernley-Lassen branch of the Southern Pacific. Fernley is a station on the main line of the Central Pacific (3389) between San Francisco and Ogden.

Each of the elements making up this route between Alturas and Wendel was authorized by the Interstate Commerce Commission some two years ago. One of those elements was the permitting of the Southern Pacific, or the Central Pacific and the Southern Pacific Company, to acquire control, by stock ownership, of the Nevada, California & Oregon Railroad Company.

The line has been standard-gauged from Wendel to Lakeview since that authority was granted, in the way of expenditure of money upon the so-called N. C. O. It was formerly a narrow-gauge railroad. For the rehabilitation about $2,400,000 has been expended in that work on the N. C. O. That, of course, doesn't include the purchase price. I don't recall what the purchase price was. I don't think all of the money has been paid yet, but it is about a million—I don't know really just (3390) what it is. It is given, anyway, in the commission's decisions; it is in the records there.

Q. Now on that part of this route between Klamath Falls and Alturas, what has been done, what is being done, and what are your instructions with respect to the remainder of it?

A. I have just completed the connecting up of location, the definite location, between Alturas and Klamath Falls, and contract has been let on the first 12 miles out of Klamath Falls, with the provision that the grading be completed by the end of September, and I expect to let the contract just as soon as I can get the data together necessary for the balance of the line through to Alturas, about the end of September, and have the line completed the latter part
1868 of May or early in June of next year; depending upon weather conditions during the winter. I hope to get across there, if possible, if the weather conditions permit at this end. We cross through Tule Lake, and if we can get through that country this winter before the rains start, the rest of the work I am satisfied I can carry on all the winter.

The Southern Pacific owns an interest in a line running up to Lakeview. (3391.) That is part of the N. C. O.

Mr. DEY. The N. C. O. extended from Wendel to Lakeview, and the Southern Pacific Company has purchased it.

The WITNESS. All of that rehabilitation will be entirely completed through to Lakeview by the end of this month. It has been in operation through to Lakeview for two months.

The expenditure involved in the construction between Klamath Falls and Alturas is estimated six million dollars, 98 miles to construct, and from Alturas to Wendel is 100 miles.

The purposes in acquiring the N. C. O. and constructing the Alturas were to give us a line for through business for the east from Oregon, from practically all of Oregon, at least the northern part of it, all of Oregon that is served by Southern Pacific lines, together with such traffic as they may gather in Oregon from connecting lines. (3392.) That is, this line was designed as a new through route on east and west through business moving to and from western Oregon and to and from Klamath Falls, and in addition, to develop such local traffic as could be developed along the line.

My instructions with respect to the speedy completion of this line are to complete it as soon as possible, consistent with economical construction.

As to the character of this route between Klamath Falls and Alturas, it would be practically a level grade for the first 40 miles out of Klamath Falls, through a farming country, and
1869 then across Tule Lake, which is also developing farming. And then we have about 30 miles of rolling grade, one per cent maximum, to the summit, and then we have about four and a half miles of 2.2 per cent grade descent towards Ogden, which will be with the traffic. (3393.) This is going to be a secondary main line. On the first 40 miles out through the flat country we are going to lay a 75-pound rail, and from there on 90-pound, on to Alturas.

Q. You spoke of crossing Tule Lake.

A. Lake bottom, I should say. It is not a lake any more.

Q. Yes. Just describe what sort of land you run through there.

A. Well, very, very rich land. Where there is water on it, it produces enormous crops. It is an old lake bed, where the lake has disappeared by evaporation and use of the——

Exam. ROGERS. Are you building this Klamath Falls-Alturas line, with a view to developing primarily that territory and serving it, or as a shorter line to the east?

A. Well, I might say both. The N. C. O.——

Exam. ROGERS. Which is the moving or prime factor?

A. For a through line.

Comr. MCMANAMY. You say you have a 2.2 grade?

A. There is a short piece of 2.2 dropping down from the plateau into the Pitt River drainage. But that is with the business, with the loads. It is about 4½ miles. (3394.) That is on this line, the new line.

As to the grade coming out of that valley to the south and east: From the foot of this 2.2 grade we have about 22 miles to Al-
1870 turas of flat country, rolling grade, water grade line; then from Alturas going on the N. C. O. we have about 21 miles of

level grade there, practically all tangent, one or two very light curves, to Likely, which is at the foot of the hill, with a 2 per cent grade, as I remember about eight miles long. That is getting up to the high lands in the Sierra Nevadas. Then we drop down on the 2 per cent grade for about six or seven miles, and then we run across a flat, across Madeline Plains for 23 miles, level grade.

Q. (By Mr. DEY.) What kind of ties are you putting into this new line?

A. Well, we will use probably—it is not decided by the operating department yet just what they will use. What they would like to have is creosoted ties, but we will probably use every other tie alternating with creosoted and untreated ties, then as the untreated come out, why, the creosoted will go (3395) on for a long life.

The distance from Wendel to Fernley is 82 miles.

Q. Now, you had charge, Mr. Boschke, of the construction of the last work on the Natron cut-off between Oakridge and Kirk, 108 miles, did you not?

A. Yes; from Black Butte to Crescent Lake.

Q. Yes. Well, there has been considerable testimony here in this case about building lines through the Cascade Mountains, and from Douglas County over, from Jackson County over and through what is called the Hogg Pass up above the headwaters of the Santiam, over to Bend, and I wish you would state for the information of the commission now just what it did cost to build up the Cascades there between Oakridge and Kirk.

A. I have those figures. Oakridge to Kirk, $18,849,246.00.
1871 That is an average cost of $174,093 per mile all the way through. That includes some 40 or 50 miles from the Summit down to Kirk, which is practically level.

As to the cost of that part of the mileage from Oakridge to Cascade Summit, which puts us through the long tunnel and up in to the plateau (3396), that is practically 40 miles, and it cost $359,000 a mile average cost. Some miles were much more expensive, though, than that. Some miles ran $550,000 a mile.

The total expenditure in the Natron cut-off and the Black Butte cut-off is $40,203,168. This Alturas line is a continuation of the Natron cut-off from Klamath Falls east. We built the Natron cut-off line to avoid the Siskiyous and two other summits between Portland and the summit of the Siskiyous. It shortens the line through with the Black Butte cut-off; in the actual distance it shortens the line to San Francisco or Sacramento 24 miles in actual distance, and saves as high, a [illegible] recall it, as 2,800 feet of grade climb in both directions and some 20,000 degrees of curvature.

Exam. ROGERS. Was the old line through Roseburg handling its maximum tonnage at the time you built the Natron cut-off?

Mr. DEY. I will have an operating witness on that phase later, although if Mr. Boschke knows, of course he may answer. (3397.)

Exam. ROGERS. If he knows he may answer; if he doesn't know, all right.

The WITNESS. Well, we double-tracked the Sierra Nevada Mountains two and a half years ago——

Comr. MCMANAMY. I think you got the question wrong. He referred to the Siskiyous and not the Sierra Nevada.

The WITNESS. Oh, I beg your pardon.

1872 Exam. ROGERS. The old line.

The WITNESS. Oh, the old line. I don't know. I don't think it had reached its maximum at all.

As to whether the Natron cut-off was built in order to serve the territory through which it runs, or as a shorter, more economical line, I think it is a more economical line. That was started many years ago. It was Mr. Harriman's idea to build that. I think that is what he had in mind, a matter of economy and to develop the country, and get a better outlet to the east for Oregon——

Exam. ROGERS. Well, in building from Kirk to Oakridge did you have in mind developing the country, or making a saving in operating expenses in handling western Oregon traffic?

A. Well, I don't know what the original intention was when Mr. Harriman planned to build that line, but I should judge it was for the purpose of opening up that timber that we passed through, and also making a more economical line to (3398) take the business out of Oregon east.

Exam. ROGERS. What was the purpose of closing up the gap between Kirk and Oakridge? That was during your time, wasn't it?

A. Yes.

Exam. ROGERS. The other was during your time too?

A. Well, there was a long-time litigation that was settled with the Central Pacific; then we went ahead with the construction. But if there had not been any litigation, I imagine the line would have been built a number of years ago. It was originally intended for a line east, connecting with the Modoc Northern. The Modoc

1873 Northern was planned in 1907, or thereabouts, shortly after construction was started on the Natron cut-off. When I refer to the Modoc Northern, that means the Alturas line. As to whether the Modoc Northern is no longer in existence, the original Modoc Northern surveys went down through Westwood, but by building across to Alturas the distance is (3399) practically the the same whether we went through Westwood or through Alturas; so the Alturas line—that is, the N. C. O.—was not self-supporting but it had developed some business on its line, and my thought was that with the through business and such business as it had developed that by standard gauging some more would probably develop around Lakeview and between Lakeview and Alturas, and it would be our best route to go out, and we would pass through large timber holdings between Klamath Falls and Alturas.

Exam. ROGERS. I don't know whether you can answer this or not, Mr. Boschke, but is there anything to speak of handled over this Cascade line now other than the eastbound traffic from western Oregon?

A. Well, I dont know about that.

Q. (By Mr. DEY.) Well, do you know, Mr. Boschke, there is just one sawmill that has gone in there at West Fir?

A. Yes.

Q. Two and a half miles from Oakridge?

A. Oh, yes. All the business we get comes out of western Oregon.

Q. What the examiner wants to know is whether or not that line has developed any local business?

A. Local business?

Q. Yes; between Oakridge and Kirk.

A. We get some out of West Fir. But there is no milling going (3400) on in the timber that is susceptible of being opened
1874 up. There is nothing going on in there between Oakridge and the summit.

Exam. ROGERS. What I am getting at, Mr. Boschke, is if the traffic is taken away from the Southern Pacific and turned over to the cross-State line at Crescent Lake, that is the eastbound traffic, what will be left for this so-called Natron cut-off to handle?

A. Well, I am not an operating man, and I would not expect that we would short-haul ourselves east when we have got lines going east.

Exam. ROGERS. That was not the question. I didnt ask you about the short haul. I want to know what would be left for the so-called Natron cut-off if you take this western Oregon traffic which Mr. Newell proposes and give it to the cross-State line?

A. Well, I can't say. I don't know how that traffic moves.

Q. (By Mr. DEY.) Well, it would still have the California business?

A. It would have the California business, yes.

Q. And such business as originates between Crescent Lake and Klamath Falls?

Mr. ELLIS. You would have a whole lot more than that, I think, Mr. Dey. I think Mr. Wiggins' exhibit will show you will still have the major part of this tonnage north and south bound. Eastbound is only a small part of the total tonnage handled by the Southern Pacific over the Natron cut-off. (3401.)

Mr. DEY. It will have left the north and south business to California, and it will have some local logs, and one thing and another, into Klamath Falls mills.

The WITNESS. Yes, sir; that is all.

1875 I had something to do with the construction of the line down the Malheur Canyon between Ontario and Crane.

Q. When you were with the O.-W. R. & N.?

A. That is quite a few years ago now. I think I built that from out about—I built it out to Riverside, as I remember it; maybe it was down below there. I don't remember. I built it from Vale to Riverside.

As to whether Mr. Buck was working under my jurisdiction when he made that survey: Mr. Buck was with me on certain locations.

No; I don't (3402) think he was working—well, he might have been working for me. He did work for me at some time. But I think he worked for the Short Line, and they made some surveys over in that country and across the country.

As to whether I know anything about this central Oregon desert country: I know when I was chief engineer of the O.-W. R. & N. lines in Oregon, we made a good many studies to see whether we could find any reason for building a line there. I have been through the country. As to whether in my judgment it did then, or does now, give any prospects that would justify the construction of this proposed cross-State line: It is a long time since I went through there. It might be a Garden of Eden now, but it wasn't when I was through there. When I was through there it was quite a desert. You would see a few people trying to make a living and they would finally get starved out and leave. Little patches of rye is about all I ever saw there.

I know Dr. Reddy of Medford. (3403.) The doctor has been trying to get me to help him build railroads for a long time.

The surveys were started by the Southern Pacific out of Drain to Coos Bay in 1905, and construction was started out of
1876 Drain in August, 1906, and the work proceeded until March, 1907, when the Drain line was abandoned. Survey started out of Eugene to Coos Bay in June, 1911, and construction started out of Eugene in December, 1911. The line was completed and put in operation to Marshfield on August 1st, 1916.

I have heard of the MacArthur-Perks people. They had not come into this country prior to the time the Southern Pacific actually started its line from Coos Bay to Drain. That was a number of years afterwards. I was not directly connected with that construction to Coos Bay, but the traffic people thought that the line from Drain would not serve the country as well, or develop as much country as the line built out of Eugene.

Q. And that is why the change was made from Drain to Eugene?

A. After talking it over a long time, then it was finally (3404) decided we would build on that route.

Q. Did you ever tell Dr. Reddy that the Southern Pacific Company only undertook to build to Coos Bay because MacArthur-Perks came out here and started it off?

A. I never discussed the line to Coos Bay with Dr. Reddy at all. The only line that we talked about was going over to Crescent City, over there to the mines.

As far as I know MacArthur-Perks did not influence the Southern Pacific into actual construction of that line at all. They started to build the line before those people were ever heard of.

The line from Drain was abandoned because the traffic department, as I remember it, of the O. R. & N. did not agree that was
1877 the proper place for the line to go. They thought it ought to start out of Eugene and go down through and develop the farming country.

Mr. DEY. Drain is a few miles south of Eugene. They started from Drain and then decided to start from Eugene.

The WITNESS. The physical difficulties there were not greater than they were along the route out of Eugene; it was a more expensive line by way of Eugene. I don't know exactly how much of that line was completed. There was some tunnels (3405) started and some steel bridges put in on the wyes, and I don't remember how many miles, but there was some little work done on it, but no very large amount of money invested.

As to what the map you show me is: The caption is, "Relief map of the State of Oregon, made by the Oregon bureau of mines and geology; scale, approximately 12 miles to the inch." There is a legend showing that the red lines are Southern Pacific; yellow, Union Pacific; blue, Northern Pacific, Great Northern, S. P. & S., and Oregon Electric; brown shows various short lines to logging railroads.

(Said map was thereupon received in evidence, marked "Defendants' Exhibit No. 100, Witness Boschke.")

They show some water in some of these lakes that I don't think is in there now. I understand some of these lakes are dried up. Silver (3406) Lake—I don't know from my own knowledge.

Mr. DEY. I might say the only purpose in introducing that exhibit is to give a little different picture of the State than is shown on the ordinary map.

Q. Do you vouch for the accuracy of this map, more than to say that it is a photograph of a relief map?

A. Yes; I don't know anything about its accuracy. I know the coloring of the lines on there, I think are shown correctly of the different railroads.

1878 Cross-examination:

No; I don't think I am familiar with the history surrounding the construction of the Oregon branch lines of the Southern Pacific Company. I was on the construction of the line from Redding to Ashland. That is the first work I was connected with there. No, you are not to understand from my testimony that the Southern Pacific Company was the originator of the extension to Coos Bay, and that it did not go in there because some one else started to Coos Bay first; I never heard of it at all.

I never heard of Ralph Hunt or of the Lane County (3407) Asset Company.

Q. Do you know whether or not the Southern Pacific Company actually bought a portion of its right of way and its survey west of Eugene of some other company?

A. As I said in my testimony, I was the chief engineer of these lines here at that time of the O. R. & N., but I happen to know that there were some people that made some surveys at strategic points. For what purpose, I don't know, unless it was to hold us up. They had not made some surveys and let some contracts for construction

west from Eugene before the Southern Pacific had ever gotten its right of way. Twohy Brothers did the first work on that line, and they commenced to tunnel about 20 miles out of Eugene and worked towards Eugene. I think Porter Brothers did do a great deal of the work on the Coos Bay branch. I was not connected with that, only I knew from numerous hearsay what was going on.

Q. But you do know some one else was in the field ahead of the Southern Pacific Company there, and they had made surveys and had taken some steps towards construction of a line?

1879 A. You mean before they started out of Drain? No. (3408.)

Q. About the time you were starting from Drain?

A. No; I came to the O. R. & N. in 1905. That is the time when they were making the survey south of Drain, and it must have been way along in 1909 or '10 before I heard anything about some people making surveys down through that country.

I don't know what was the occasion for the long delay from the time I first made my survey from Drain until I actually got a line into the Coos Bay country. As I said, I was not connected with the line. I know that Mr. Hood objected strongly to changing and going out of Eugene, because it was a longer line and cost more money, and a harder line to maintain, more expensive line to maintain.

I haven't in mind the exact mileage of the Alturas line from Klamath Falls to Alturas, but it will be between 97½ and 98 miles from where we leave the main line, the present main line, which is 2 miles east of the Klamath Falls station. From Klamath Falls station to Alturas will be 100 miles. The estimated cost of construction of that line is six million dollars.

I gave some figures of the cost of the (3409) Natron cut-off, particularly west of the Cascade Summit. I can not state what the cost per mile was from Cascade Summit to Kirk; I haven't that cost separated but I should imagine that ran somewhere around $70,000 a mile, an average. The first part of it out of Kirk for 40 miles cost about $49,000 a mile, as I remember. I have about 4½ miles of tunnel on the Natron cut-off.

The standard gauging of the N. C. O. line to Lakeview was not necessary to handle the traffic that was offering to the line at the time I took it over. We had in mind the connecting up of the line (3410), the line from Klamath Falls across. I had in mind also the development of additional tonnage that might result

1880 from change from narrow to standard gauge, that I think will develop. In fact, I personally think that that is one railroad we built we are pretty sure we can earn our keep on it. Some of them are doubtful, but I don't have much doubt about that line supporting itself. As to what particular portion, in my mind, of the western Oregon tonnage going east will be routed via this new north and south line which I say I am constructing, I think as far south as Roseburg it would pay to backhaul it up to Eugene. I

don't think there is any question at all that all eastbound tonnage from points as far south as Roseburg would be routed over the Modoc Northern. It is the economical way to take it. It would move to Eugene and then over the Natron cut-off. You see, the Natron cut-off is rather a favorable (3411) line when you come out of Oakridge on practically a water grade line, and then we have 40 miles of one-eighth grade, then practically downhill; it is downhill all the way to Klamath Falls, and one per cent then.

Redirect examination:

When I say a line that will earn its keep, I mean it will earn its keep with the through business and the business that develops on the present N. C. O., and the business that will develop between Klamath Falls and Alturas; then we will earn our keep. It will take, in my judgment, all of those elements to justify it. I don't know that those were all fully covered in the previous case, when the application was sought for the carrying out of this line or route. I suppose so. Plans were made that way long ago. (3412.)

1881 PORTLAND, OREGON, *August 22, 1928.*

J. P. DELANEY was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am connected with the office of the auditor of the Southern Pacific Company in San Francisco.

I have prepared a statement showing the investment and financial history for the past several years of the Southern Pacific Company's lines in Oregon. The statement which I have is a statement prepared by myself. It correctly reflects the investment and earnings of the Southern Pacific Company's lines in Oregon. (3413.)

(The statement, consisting of one sheet, was thereupon received in evidence, marked "Defendants' Exhibit No. 101, Witness Delaney.")

Exhibit No. 101 shows the result of the operation of the Southern Pacific Company's lines in Oregon for the calendar years 1916 to 1927, inclusive. The revenues and expenses were taken from our annual report to Public Service Commission of Oregon. These revenues and expenses were compiled in accordance with the rules and regulations of that commission.

The exhibit also shows taxes, equipment, and joint facility rents and uncollectible railway revenues, which items are deducted from the net revenue thereby producing the item net railway operating income upon which the rate of return is figured. It will be noted that the rate of return for any of the years did not reach 2 per cent. The highest was 1.81 per cent, in 1917. The years 1920 and 1927 both show losses. From this it will be seen that the rate of return on Oregon investment is far short of the 5¾ per cent, which has
1882 been considered a fair return at the present time. Just (3414) how much the net railway operating income for Oregon is

short of 5¾ per cent on Oregon investment is shown three lines down from the rate of return. For the year 1927 the amount was $8,525,297.

The averages per mile of road are also shown on this exhibit at the bottom. The operating revenues per mile of road for Oregon for 1927 were $13,108.90, operating expenses $11,914.23, net operating revenue $1,194.67, net railway operating income nothing. This rate of return is based on the book value. While the operating revenues increased from $9,087,773 in 1917 to $18,457,230 in 1927, or 103 per cent, operating expenses increased from $7,401,331 in 1916 to $16,722,331 in 1921, or 126 per cent; and taxes increased from $622,430 in 1916 to $1,659,290 in 1927, or 166 per cent.

The property investment shown on this exhibit represents the book value of our lines in Oregon plus a proportion of the equipment owned by the Southern Pacific Company and its leased lines on the Pacific lines based on the mileage made by the various classes of equipment in Oregon to mileage made on entire Pacific lines.

If this investment in equipment were excluded the rate of return for each year would be 1916, 1.21 per cent; 1917, 2.01 per cent; 1918, 1.40 per cent; 1919, 1.75 per cent (3415); 1920, nothing; 1921, .94 per cent; 1922, 1.75 per cent; 1923, 1.97 per cent; 1924, .99 per cent; 1925, 1.07 per cent; 1926, .07 per cent, and 1927 nothing, instead of the per cents as shown on the exhibit.

This property investment of 142 million odd dollars includes all of the operating properties in Oregon operated by the Southern Pacific Company. That includes, for 1927, the Natron cut-
1883 off, or Cascade line from Natron to the State line south of Klamath Falls, title to which is vested in the Central Pacific Railway Company. For 1926, there is a note at the bottom of the statement that shows how much we left out on account of closing the gap between Natron and Oakridge, or between Oakridge and Kirk. As to what I mean by having left out something; that line was under construction during those years, and we were not operating over the complete distance between Kirk and Oakridge—in the year 1927 we were operating and therefore that is all included. (3416.)

I have prepared a similar statement covering, however, the Southern Pacific Company's Pacific system. And the figures shown thereon are of the same accuracy as the other statement with respect to which I have testified.

Exhibit No. 102 shows the operations of the Southern Pacific Company—Pacific lines for same period as shown for the State of Oregon, It covers the lines extending to Portland, Ogden, and to El Paso up to and including the year 1923; subsequent to 1923 it includes the El Paso and Southwestern Railroad and Arizona Eastern, which were taken over by the Southern Pacific Company in latter part of 1924.

This exhibit shows the operating ratios, property investment, rate of return and averages per mile of road, similar to exhibit

for State of Oregon. It will be noted that operating revenues, expenses, net revenue, and net railway operating income per mile of road, is greater than that shown for the State of Oregon.

The purpose of this exhibit is to show that the rate of return for the years indicated has not reached 5¾ per cent, which is considered a fair return. (3417.)

1884 On both of these statements I have used the company's book value. As to how that compares with the tentative valuations put out, I think the tentative valuation of the commission was less than the book value, but that the company's valuation was approximately the same figure as our book value. I don't know how much less.

(The statement, consisting of one sheet, was thereupon received in evidence, marked "Defendants' Exhibit No. 102, Witness Delaney.") (3418.)

Cross-examination:

Q. (By Mr. ELLIS.) On Exhibit 101 can you state precisely the basis of the apportionment of revenue and expenses to the State of Oregon, as used in Exhibit 101?

A. Well, the intrastate revenues are allocated directly to the State, and the interstate revenues are on the basis of mileage in Oregon as compared to the mileage on the Pacific lines, and pro rated on a strictly mileage basis.

Q. And the expenses are charged where incurred?

A. They are localized as far as possible to the State of Oregon; otherwise it is on a mileage basis.

Q. Then on the intertate traffic the cost of originating the traffic, terminal expenses, would be charged to Oregon and it would get a straight pro rate on the total mileage haul?

A. On the revenue, you mean?

Q. Yes; on the revenue.

A. Yes.

Q. Then, to illustrate that situation, on a car of lumber originating at Klamath Falls and destined to Chicago, the expense of originating that car and hauling it to the California line would be included in the Oregon expenses?

1885 A. Yes; it would.

Q. And the revenue assigned to Oregon would be the proportion which the miles from Klamath Falls to the California line (3419) would bear to the total mileage from Klamath Falls to Chicago?

A. No, it would not be to Chicago. Did I say expenses to Chicago, in the first place? No; the expenses and revenues would go as far as our line went and be divided on that basis.

Q. Yes; that is correct. But in almost the same degree it would apply on through to Chicago, wouldn't it, with the exception that some other line would get a part of the revenue from there on?

A. Well, our revenues would be only pro rated to Oregon on the basis of the amount we got out of the haul.

Q. Well, that would result, would it not, in red-inking Oregon for every car of lumber that was originated near the California line for Chicago, or practically all of the Klamath Falls tonnage?

A. Well, it might in one way. It might not in another way. Take on an interstate shipment, you would get all the revenues and be charged all the expenses.

Q. It would actually cost the State of Oregon, under this system, more to originate the lumber traffic at Klamath Falls than the total revenue that is credited to Oregon for that lumber traffic?

A. It might, yes.

Q. Oregon is a heavy tonnage originating State, is it not, so far as Southern Pacific operations are concerned?

A. Well, it is quite heavy, but I don't think it is anywhere (3420) near as heavy as California.

1886 Exam. ROGERS. Well, do you know about this traffic originating now, or are you just from the auditor's office?

A. Well, we have our reports which show how much traffic is originated in Oregon, the Public Service Commission reports.

Q. (By Mr. ELLIS.) There is very little bridge haul traffic on the Oregon lines of the Southern Pacific, isn't there?

A. What do you mean, in Oregon?

Q. In Oregon.

A. Well, if I remember correctly, I think the average haul in Oregon is about 111 miles in 1927.

Q. That would indicate that the greater percentage of the traffic originated in Oregon and that a small per cent was bridge traffic passing through the State, so far as your lines were concerned?

A. Well, let's see. Bridge traffic would have to go right across the State, is that what you mean?

Q. Yes.

A. Well, I guess it would be mostly originating traffic.

As to whether in the investment shown, or used as a basis for Exhibit 102, the Southern Pacific's investment or properties in old Mexico are included (3421): In Exhibit 102 there is no investment there included. It just extends, as I say, to Portland, Ogden, and to El Paso, and includes the Arizona & Eastern, and the El Paso & Southwestern since 1924.

Q. Did you include only operating property?

A. 701 and 702, and then on the Southern Pacific Company lines as a whole, on Exhibit 102, I believe it is, there is material and supplies in there, account 716, but there is none for Oregon, none in the Oregon statement.

Q. But you are sure you included no strictly non-operating property?

1887 A. No; just accounts 701 and 702, and 716.

Q. (By Mr. MCCULLOCH.) Mr. Delaney, is this Exhibit 101 a statement or a compilation that is regularly kept by the au-

diting department of the Southern Pacific Company for Oregon lines, or was it specially prepared for this case?

A. The revenues and expenses are made in an annual report to the public service commission.

Q. Yes; I know that, but is this statement, the tabulation (3422) constituting Exhibit 101, one of the tabulations that is regularly kept by the auditing department of the Southern Pacific Company?

A. Do you mean do we make this statement every year?

Q. Yes.

A. No. The revenues and expenses are in our reports every year, but when we are asked to make the statement we just draw the revenues and expenses off the reports and bring the other figures up to date.

Q. That is what I wanted to bring out. This statement 101 was specially prepared for this case? You didn't have it on file when it was requested?

A. Why, no.

Q. In this form?

A. Not just in this particular form, no.

As to whether we have on file, or keep regularly, similar tabulations for the results of operation of Southern Pacific Company's lines in other States, Nevada, Utah, California, Arizona, New Mexico, and so on, we make a report of revenues and expenses, something like the annual report to the Public Service Commission of Oregon.

As to whether my company hauls any empty cars north from California for loading with lumber in Oregon, I guess they
1888 do. I am not quite familiar with that part. (3423).) If an empty car were hauled north from San Francisco to Klamath Falls for loading with lumber under the method of allocating revenues and expenses to the lines in Oregon, the cost of that empty car haul would be pro rated on the mileage within the State of Oregon. It would be in trainloads and everything else.

If I made up, or had made up, a statement in the form of Exhibit 101 for the lines of the Southern Pacific in California, I could not tell you what results it would show with respect to rate of return on investment. That would be—it is quite a job to make up that annual report every year. As to whether we ever made such a statement for the California lines, we make an annual report to the California Railroad Commission, but it is on a train mile basis. You just simply take the train mile per cent of the total system figures and work it out that way.

As to whether if I know what a statement or tabulation in the form of Exhibit 101, which was for the Oregon lines, would show as to rate of return on investment, if it were made for the Southern Pacific Company's line in Nevada or Utah (3424), I have not made such calculation. I don't know what such a compilation would show for operations of the Southern Pacific in Arizona or New Mexico or Texas. We make a report which shows the revenues and expenses only.

Exam. ROGERS. Mr. Delaney, the tentative valuation of the commission of the Southern Pacific Company was something like $792,000,000, wasn't it?

A. I don't recall what the figures were.

Exam. ROGERS. If that is true, the difference would be in the neighborhood of $375,000,000 between the valuations you have shown and the tentative valuation?

1889 A. The 1916 figure?

Exam. ROGERS. Well, the valuation basis.

A. That is about 792 million?

Exam. ROGERS. Yes; something like that.

A. What would that cover, all the Southern Pacific lines or just the Pacific lines?

Exam. ROGERS. What do you include in the Southern Pacific Company that is not in the Pacific lines, what territory? (3425.)

A. Well, the Texas and the Louisiana lines, and the steamship. Those lines, lines in Texas and Louisiana, we call them, and the steamship lines running from New York to Galveston and New Orleans.

Exam. ROGERS. As I understand, this figure as given does not include those lines?

A. Yes. That does not include equipment, though, does it? 792 million, does that include equipment?

Redirect examination:

Q. (By Mr. DEY.) Mr. Ellis asked you about bridge traffic, Mr. Delaney, and by that I assume that he meant traffic which passes over the Southern Pacific lines through the State of Oregon, not having been picked up in the State or laid down in the State. Now, is it not a fact that there is a large volume of traffic that moves from California and south to points in the Northwest beyond Oregon?

A. Yes; I guess there is. I have no definite information of that. (3426.)

1890 F. L. BURCKHALTER was thereupon called as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am first assistant general manager of the Southern Pacific Company, with offices in San Francisco. Have been associated with this company about 28 years. I am a civil engineer by education and profession, but for 14 years have been in the operating department. In the operating department I cover the Pacific lines, reaching from Portland to El Paso and Tucumcari and Ogden. I am assistant to the general manager, and we carry on the duties of the general manager's department. We handle the operation through two assistant general managers. There are three different districts, the northern district, the southern district, and the eastern district. (3427.)

And they, through the superintendents, and on down, operate the road.

In Oregon I was connected with the Portland division for about 7 years, 3 years as district engineer, and the 4 years following as division superintendent, and I have since been assistant general manager of a district in which the Portland division is located—the northern district, which extends from San Francisco to Portland and Ogden and south to Fresno; and more recently I have been first asst. general manager, still having jurisdiction over this part of the lines; so I have been officially connected with the division since 1911.

By Portland division I mean the lines from Portland to Crescent Lake and Ashland. The lines from Crescent Lake south on the Cascade line and from Ashland south on the Siskiyou line are in the Shasta division. This runs as far as Gerber, California. From there on it is the Sacramento division—to Davis and to Sacramento. (3428.)

1891 The bridge traffic of the Southern Pacific Company moving between Portland and California, is moved over the new Natron line via Crescent Lake and Klamath Falls. The local traffic going to California or beyond, which includes Ogden, north of Divide is handled through Eugene and Crescent Lake; south of Divide the traffic going to Ogden is handled via Ashland and the Siskiyou Mountains.

The traffic that is local to territory Eugene to Black Butte is moved via Eugene—I mean moved via Roseburg or Klamath Falls. in accordance with a tariff with the traffic department has filed, which goes into a great deal of detail—that is, the business that is local to that territory and close-by points in California. Anything where the local rates are not affected and it is only a matter of company convenience, we are hauling the business from north of Divide to Ogden via Crescent Lake and south of Divide through Ashland.

Divide is about 27 miles south of Eugene, and is the summit of the drainage between the Willamette and the Umpqua Rivers. (3429.) From Divide southerly the railroad drops off quite rapidly down to the Umpqua drainage.

Comr. McMANAMY. The distance from Divide to Ogden is substantially the same either way, is it not?

A. Practically so, yes. The Cascade line is about 24 miles shorter——

Comr. McMANAMY. From Eugene?

A. From Black Butte to Eugene, than the Siskiyou.

Comr. McMANAMY. The distance from Eugene is 27 miles to Divide?

A. Yes; there is very little business, I might say, between Divide and Roseburg. It is mostly a canyon, hilly country there, and there is very little business on that part of the line.

I was a witness in the Klamath Basin cases.

1892 Q. And prior to the determination with respect to the construction of the Alturas line, did you have occasion to study the entire situation so that you then had, and now have, some definite idea as to how you expect the traffic to move from an operating standpoint after the competition of the Alturas cut-off?

A. I have.

Q. Now, will you describe such plans as you think will become (3430) effective?

A. The Alturas cut-off will afford a shorter route for all traffic originating or destined north of Klamath Falls, on the one hand, and east of Fernley, on the other hand, and will also afford a shorter route for traffic out of northern California moving between Ogden and points in northern California. We figure that lumber originating as far south as Dunsmuir, or more particularly Mt. Shasta, because there isn't any between Mt. Shasta and Dunsmuir of any consequence, will go east via Klamath Falls, because it will find a shorter route. The distance from Black Butte to Fernley via Roseville is 409 miles, and via Alturas is 368 miles. Black Butte is the divide between the Sacramento River and the Klamath drainage—the line drops off coming north from there and going south—so we can haul business from about Dunsmuir around to Klamath Falls to advantage going to Ogden. I haven't mentioned what little local business there might be that would be affected by the route, but I think that answers your question as to the through business.

I expect the Alturas line to be completed about May of next year. It is expected that this line will be able to carry the traffic from the territory that I have described, yes. (3431.)

The most important item of perishable freight originating on our lines in Oregon is the fruit traffic out of the Rogue River Valley, consisting mostly of pears and apples. It is now moving
1893 to Roseville and thence east. Following the construction of the Alturas cut-off the Alturas route would afford a route that is 41 miles shorter than the route through Roseville, from any point north of Black Butte, which, of course, includes all of the Rogue River Valley—any point north of Black Butte up to or pretty close to Eugene. The perishable traffic originating in the Rogue River Valley has grown considerably in volume in (3432) the last few years, and if it attains a volume that would justify it moving via Alturas and we felt we could better the time appreciably, why, we would be glad to move it that way.

The schedule on the Rogue River fruit to-day from Medford to Chicago is 188 hours. That consists of 31 hours Medford to Roseville and connection with fruit block out of Roseville, and I have allowed 3 hours at Roseville, which I think is a liberal and fair allowance. After leaving Roseville, the fruit is on the 154-hour schedule for fruit and vegetables Roseville to Chicago, and we are running those trains most of the time considerably ahead of time. We have a very large movement of perishable traffic east from Rose-

ville. (3433.) It consisted in the year 1927 of 1,600 fruit blocks, containing 71,849 cars. We generally deliver these blocks comfortably ahead of time to the Union Pacific at Ogden, and they have the advantage with nearly every one of these blocks of getting it ahead of time, and on a very few occasions we have delivered the trains late on schedule to them, and they have in those cases almost invariably made up the time——

In 1927, out of the 1,600 fruit blocks only 21 went into Council Bluffs late, which is 1.31 per cent. This year we have so far moved 589 blocks to Ogden, containing 25,882 cars, and made schedule time with all of them.

Q. Now, just there, if you make better than your 154-hour schedule, then your Rogue River fruit would to that extent arrive in Chicago in less than 188 hours from Medford?

1894 A. That is true; whatever we make up on that schedule would show that much earlier arrival.

Q. Now, by way of Alturas, what do you think you can do with that fruit?

A. I have made a calculation assuming the fruit would move via Alturas and Fernley, and figure that the time would be shortened about 11 hours. I did that by assuming the speed of (3434) 12 miles an hour from Medford to Fernley, allowed 2 hours at Fernley for connection, and added the time of our standard fruit blocks from Fernley to Chicago, which gives a total of 177 hours.

Q. Now, what do you think can be done by way of the cross-State line, with that same traffic?

A. Using the same method, that is, allowing 12 miles an hour from Medford to Ontario, by way of Crescent and Crane, and there coupling up with the Union Pacific's fruit block schedule, I figure 187 hours.

Those plans that I have mentioned, 188 hours now via Roseville, and 177 via Fernley, and 187 via Crane, are all quite close together. There isn't much variation there, considering the total elapsed time, and the conclusion I reach is that the same time could be made on any three of those routes; that is, the difference is not so great but what whatever was considered time for the Medford fruit would be made by any of those rates—could be made by any of those routes.

I planned on getting to Crescent Lake by Klamath Falls. (3435.)

Mr. DEY. Now, let us assume that the Roseville route, the Alturas route, and the Crane route are all owned separately and operated separately, that is, as competing carriers, what would the result be, in the light of your experience and the practice that railroads adopt generally, especially the western roads, with respect to that type of traffic?

1895 A. All three of those separate carriers would have an identical schedule for fruit from Medford to Chicago; the schedule, elapsed time, would be identical.

This 188-hour schedule out of Medford calls for a departure at 10.00 p. m., and 31 hours to Roseville, which makes 5.00 a. m., and

I have allowed them 3 hours, which would make them out of Roseville 8.00 a. m. We have no fixed departure from Roseville, but we endeavor to take this fruit that leaves at 3.00 a. m., and connect it up or run off the times that its arrival in Chicago will be equivalent to the time had the train departed at 3.00 a. m., which makes the 3.00 p. m. delivery at Chicago. That is 1.00 p. m. at Chicago. The idea of getting into Chicago about that hour of the day is to connect with the trains east from Chicago to the Atlantic seaboard. We are endeavoring, and generally do, to run off the time that trains leave after (3436) 3.00 a. m., to put them on the schedule that they would have made had they left at 3.00 a. m., that applying to fruit that leaves up as late as noon. The reason for this is that the marketing of fruits is in the early morning, and it is generally true, that unless the fruits get to their destination in time for that early market it might just as well wait until the next morning. Then, most of the perishable traffic going beyond Chicago leaves there in the evening, so a car that is going to Chicago and the owner desires to put it on the Chicago market the following morning, or, if he concludes he can do better to send it on east, he wants to make the previous evening's connection east, in order to make the morning market at some other point.

Exam. ROGERS. Well, if your 188 hours is so arranged as to get you to these morning markets, the question in my mind is as to how the 11 hours reduction is going to help very much?

A. Well, the point is that this fruit now moving through (3437) Roseville, gets there about 5.00 a. m. and leaves about 8.00, which makes it about 5 hours late. Now to make the same run via Fernley, if we ran over there 11 hours sooner, we would have run off that 6 hours and bring it to 3.00 a. m. that we are now behind arriving Roseville, and we would have about 5 hours margin there for connection to connect up with a theoretical 3.00 a. m. departure out of Roseville.

1896

Even if the trains depart after 3.00 a. m. we endeavor to put them on a schedule that would be equivalent to a 3.00 a. m. departure. If we start the first train of 20 trains out with the schedule of the present hour, and the 20th train, considerable time elapses, then the first train must exceed the schedule in order to close up, and they will all get there to market, and we all endeavor to do that—I say "we"—the carriers all endeavor to do that. (3438.) It boils down to this, though, whatever the schedule was out of Medford, it could be made within the realm of practicability by any route out of Medford, that is, via Roseville, via Fernley, or via Crane, the schedule could be made on any one of those three routes with about the same facility.

I don't think Portland is a practicable route for Rogue River fruit.

Exam. ROGERS. This forty some miles saving in mileage, that only applies to the Rogue River, as I understand it, the Rogue River section? What I had in mind, Mr. Burckhalter, as I remember it,

the statement has been made here several times that it would be a saving of some 200 miles—via the Alturas route as distinguished from the Roseville route, on this western Oregon traffic.

A. Well, that is the comparative distance from Klamath Falls to Fernley via the two routes. That is what we have discussed in this hearing, as I understand it, many times, that the (3439) Alturas route saves about 212 miles over the Roseville route for traffic moving through Klamath Falls, but when we get over
1897 to Black Butte we get a little different equation there and the saving is 41 miles.

Q. (By Mr. Dey.) Now, with respect to perishable fruit from Douglas County, take the point of Roseburg, Mr. Burckhalter, and have you made a similar study with respect to the movement of perishable fruit out of there through the gateways of Roseville, Portland, and Crescent Lake and Crane, and Crescent Lake-Alturas?

A. Yes; I made some calculations to show what Roseburg perishables might do via the various gateways.

I conclude that the traffic now moving from Roseburg through Portland is making Chicago in about 190 hours. I figure that if that traffic was hauled south to Black Butte, Klamath Falls, Alturas and Fernley, it should make about 192 hours; that if it was hauled back to Eugene, then to Crescent Lake, Klamath Falls, Fernley and east, it would make about 185 hours. I figured similarly if it moved via Eugene, Crescent Lake, and Crane the schedule would be 178 hours. (3440.)

There is only a difference of 7 hours between Crane and Alturas routing in time, and the schedule would be the same over either line as a matter of practical practice, if they were in separate ownership and competing lines. They would still make the same schedule if the gateway were opened so that the originating line could be short-hauled.

The reason that we have only 7 hours difference there, with a difference in mileage of 213 or 214, is due to the fact that the schedule on our central route, that is, Roseville to Chicago, is a little bit faster than it is from Rieth, in Oregon, to Chicago. The Southern Pacific-Union Pacific and Iowa lines fruit blocks are on a slightly faster schedule than the schedules out of this Northwest territory, as figured over the Short Line, Union Pacific and Iowa lines.
1898 I might say that the 154 hours Roseville to Chicago is equaled by the Santa Fe from Bakersfield to Chicago, and by the Union Pacific, Southern (3441) Pacific and Sante Fe from Colton to Chicago. They all maintain the same schedule. I wouldn't expect any carrier to have a faster schedule than any other carrier for perishable freight out of the same territory.

Unless the schedule is shortened in order to get there a day earlier, a few hours shortening wouldn't make any difference. The theoretical schedule and the practical operation must be such so as to catch a market; but the point I am trying to make is that that is

the way the schedule would be fixed as between competing lines out of any territory. A schedule is set up which will meet the market, and all the roads involved meet that schedule, notwithstanding their mileages may be a little different, but only slightly so, and the line that is a little longer can readily take up that time; they will just have to travel a little faster. That is true of passenger traffic, also. (3442.)

The schedules of all the carriers are supposed to be reasonably prompt, and a carrier that couldn't meet the adverse schedule of another carrier that was two days shorter wouldn't expect to get any business.

Comr. McMANAMY. Now, in view of your explanation that these fruit blocks are arriving in Chicago at practically every hour of the 24, do you still think that a few hours, 10 hours, 12 hours, wouldn't make any difference?

A. The fruit blocks are arriving at Chicago consisting of many trains spread. They have to be separated half an hour or an hour, according to conditions. They can't move 20 trains in one into Chicago or any place else—you understand, Mr. Examiner and Mr. Commissioner—but to take care of the market condition the train that departs on the theoretical 3.00 a. m. schedule must
1899 run ahead of that schedule and get in ahead of that schedule and get in ahead of that schedule so that the last train can get in on the schedule. That is what we aim to do. Have I made it plain, please? (3443.)

Comr. McMANAMY. Yes; but in view of the fact that there are 18 or 20 or perhaps 30 fruit blocks in one day, they must be distributed over the 24-hour period—some get in at 1 a. m., 3 a. m., 11, 10, and midnight, all on the same day.

A. Yes; they do that in the rush season. We don't endeavor or don't try to run off delay that is over probably 10 or 12 hours in departing time. If fruit gets into Roseville or any other assembling point more than 8 or 10 hours behind the departing time we don't expect to run off that tonnage, and it won't make the same market as the fruit that was in there and ready to go at 3 a. m., so there is some business going around the clock, but as to the first train that leaves at 3 a. m. and is due in Chicago, say, about 1 p. m., and then if trains left every hour after that up to 8 or 9 or 10 o'clock, that would be 7 trains—we would get that seventh train in there at 1 p. m., according to schedule, and if we could go in there, why, the train that left at 3 a. m. would have to get in considerably ahead of 1 p. m., so the whole procession would be in there and the last one would get in on the theoretical time.

Comr. McMANAMY. Providing the traffic conditions on the Chicago & North Western permit.

A. Yes; well, we have three lines, of course, out of Omaha (3444), three connections, the I. C.——

As soon as the cars arrive in Chicago, the Chicago lines break up the trains and distribute the cars, take them to the team tracks or

the hold tracks, inspection tracks, as may be directed by the shipper. The Chicago sales won't begin until the following morning, gener-
ally. I don't think; but if the shipper has a car he has sent to
1900 Chicago with the thought that he will dispose of it at Chicago
if the price suits him, otherwise if he thinks he will do better he will send it on to New York, he wants it in there in order to catch the New York connection that evening out of Chicago, and if he doesn't send it on east, why, he is there for the following morning market.

A great many of the last cars reach Chicago in time for the New York connection. Ordinarily trains that leave 8 or 10 hours late on the clock time out of the west assembling point, such as Roseville or Colton, will get through as *as* to make the New York connection. (3445.)

The Southern Pacific could very conveniently meet any schedule or any time that is made on any class of traffic through Crane by the Alturas route.

With respect to the public convenience and necessity being better accomplished by way of Crane and Ontario as against the Alturas route, from the standpoint of theoretical schedule, the fruit could move either way. I think that in practice the service might be a little better via Alturas, because there is a bigger tide of fruit moving there, more trains, more chance of prompt connection; there is more double-track on that route, and the schedules are a little bit faster. There is about 108 miles more double-track on the Alturas route as against the Crane route from Crescent Lake to Granger.

We have two icing tracks at Klamath Falls with an icing platform between, which holds about 28 cars at the platform. The tracks (3446) themselves hold about 70 cars. And it is the intention to extend the platform as may be necessary, and the platform can be ultimately made 70 car lengths with the existing track arrangement, should that become necessary. By extending the platform we can ice 140 cars. I think they would extend to Winnemucca, Mr. Commissioner, but I haven't gone into it enough to say positively.

After leaving Roseville, we first ice at Sparks, then at Carlin, then
at Ogden. (3447.)

1901 The distance from Roseville to Sparks is about one-half the
distance from Klamath Falls to Winnemucca. But we have this condition: That the fruit leaving California in the busy season is quite warm, and we find that the first icing that fruit gets is always pretty heavy icing when it is located in a hot country. The first icing the fruit receives is at Roseville, which is a heavy icing generally. We do not precool at Roseville. All we do is to put ice in an empty car that is going out to be loaded with fruit. The ice is put in the car at Roseville when they load them if it is going to be reasonably close to Roseville. Then it is going to come back to Roseville and is reiced there.

Fruit that is loaded in the Sacramento Valley is usually loaded in cars that have been precooled. All the cars where the shipment

is under ice, the car is all iced before the fruit is loaded. The shippers precool some of the fruit, but very little of it is precooled by them. (3448–3449.)

The icing at Sparks is not so heavy. At Medford the cars are iced before the fruit is loaded, and then they are reiced after they are loaded, so the cars leave Medford with full tanks of ice, then going to Klamath Falls they would get their tanks filled up again, and I think they would make Carlin without icing. (3449.)

Klamath Falls is not a large terminal; we have about 6 or 7 train tracks. This terminal was completed at the time the Natron line was opened to freight service, about two years ago, as to the additions that were put there. However, it has been a terminal ever since the railroad extended to Klamath Falls as a branch line, and was always the terminal for that part of the railroad, but when we put through traffic on there in connection with completing the Natron line it became necessary to somewhat enlarge it, extend the tracks and build an engine house, and that sort of thing, and I think
1902 we spent over a million dollars there, and we have plenty of room to build a good many more train tracks, if necessary. This terminal is ample to handle with expedition and in a perfectly modern up-to-date way, the traffic that will flow in there from western Oregon, from the south and (3450) from the east through Alturas to Klamath Falls. We have expansion for a few more tracks that I might like to build some time in the next few years. We have got the yard outlined, and we have got the spaces laying right there to drop the tracks in between the present body tracks and the outside running tracks. It is 99 miles from Crescent Lake.

Q. Now again, with respect to your perishables, will you please state in the record the movement of perishables that you have from California through Roseville and on through Fernley in January, February, and March, which is the season that the broccoli moves There has been a lot of testimony in this record about broccoli that you have not heard because you have not been here, but I want to find out how that broccoli movement would move over the Alturas route and fit in with your fruit blocks, whether you are otherwise overcrowded on the Central Pacific line at that time of year.

A. In January this year we moved 1,297 perishable cars east from Roseville, averaging 42 per day; in February, 1,294, averaging 43 per day; March, 1,713, averaging 55 per day; in April, 3,474, averaging 78 per day; and from then on there has been considerable increase. (3451.) September was our busiest season last year because of the movement of grapes from California, and we averaged 623 cars that month. In October we averaged 607 cars per day. In January, February, and March the average was 30 or 40 cars a day. Yes; we have plenty of room to pick up 20, 30, or 40 cars of Broccoli a day at Fernley, Nevada, in those months.

Q. Now what, in your opinion, would be the relative operating advantages or disadvantages as between the proposed cross-
1903 State and the Alturas line on ordinary freight, such as lumber, moving over the Cascade line from Eugene into Crescent

Let us assume that it is interchanged there with the Union Pacific system lines, on the one hand, and on the other hand, that it is taken from Crescent down into Klamath Falls and moved over the Alturas line, what would be the relative time that would be made there, in your opinion, and why?

A. Well, the business we set out at Crescent Lake to go over (3452) the cross-State line would not probably make as quick a connection as if we took it down to Klamath Falls and moved it out of Klamath Falls via Alturas. We have a very fast railroad from Crescent Lake to Klamath Falls, a distance of 99 miles, and practically all down hill. That is a very fast freight run southbound. Very often it is made in five and six hours. So I think ordinarily the business moving through Crescent Lake that we took through to Klamath Falls would be in Klamath Falls before it could have left Crescent Lake, had it been set out there. And I think probably that on an average it would get out of Klamath Falls about as quick as it would get out of Crescent Lake, probably even sooner.

That is, on the assumption, Mr. Commissioner, that the greater density of traffic will afford a better interchange connection. I assume that there will be much more business going out of Klamath Falls to Alturas and beyond than would go out of Crescent Lake to go over the cross-State line. And if they only ran one train a day over the cross-State line, business would have to connect with that train or suffer delay. Out of Klamath Falls I am sure we will run more than one train a (3453) day via Alturas, and for that reason I think we can make better connection ordinarily at Alturas. It is relatively a very fast freight run from Crescent Lake to Klamath Falls.

Q. (By Mr. DEY.) Now what does a freight train ordinarily make in time on such a run as your Alturas line will be, or, let us assume across the cross-State line, assuming that the cross-State line is going to be built of as good construction as the Alturas line, what time would your freight trains make over these lines as compared with that stretch of track between Crescent Lake and Klamath Falls?

1904

A. Well, the trains are not likely to make nearly as good time on the cross-State line or on the Alturas line as they will between Crescent Lake and Klamath Falls, because the line Crescent Lake to Klamath Falls will undoubtedly always be a higher standard railroad than those two secondary main lines that we are discussing, and also because in the direction we are considering it is all down hill from Crescent Lake to Klamath Falls, whereas the other lines present considerable grades and curvatures.

There is also very little curvature between Crescent Lake and Klamath Falls. So the time would be relatively faster. (3454.)

And with through train service over the Alturas line or the cross-State line it would certainly be the aim of the operating officers to get the trains over without the penalty of overtime, which would require an average speed between terminals of 12½ miles an hour or better. Of course, a little delay at Terminal would slow them down,

so probably dead freight there might make about 10 miles an hour across those lines. Perishables would probably do a little better. Business moving in local freight trains that would have to do a lot of switching en route would not make such good time.

Assuming that the cross-State line is as good a line and has just as good service over it, and its freight trains make this 10 miles per hour, if it is 215 miles shorter than the Alturas line it would mean 21 hours difference in time. This 21 hours would be cut down to
1905 such extent as the cross-State line did not permit of as effective operation as the Alturas line. And the interchange delay would become a factor there at both Crescent Lake, Klamath Falls, Fernley, and Ontario. (3455.)

In the winter there is generally a good deal more snow at Crescent Lake than at Klamath Falls. Nine miles north of Crescent Lake terminal the snowfall on the ground, the accumulation of snow on the ground March 18, 1927, was 128 inches—at Cascade summit. (3456.) At Crescent Lake there was about 56 inches on the level, in our yards and around our stations and engine houses.

We have 1,645 feet of concrete and mud shed. It is to protect the track from mud and snow slides. And we have 145 feet now under construction, and we propose to build probably next year about 520 feet more. Our mileage over the Sierras must be around 20 miles. But we are taking the sheds down in the Sierras at quite a rate. We are getting down 3 miles this year, and it must be remembered that the Sierra summit is slightly over 7,000 feet, whereas the Cascade summit is only 4,800 feet. (3457.)

In February of this year we only had about 12 inches of snow on the ground at Crescent Lake and about 40 inches at Cascade summit. The greatest snow we had this past winter at Cascade summit was only about 68 inches. This larger fall that I mentioned was an exceptionally heavy winter. On the summit of the Sierras we generally have about 10 feet of snow. In severe winters we have had 20 and 30 feet.

I am not familiar, Mr. Commissioner, with these Northern lines, but I would say this: That we have a little more snow at Crescent Lake, I would think, than we do at Sparks or any terminal on (3458) the Ogden route, or at Klamath Falls. And on an average a little more than at Truckee. The snow lays longer at Crescent Lake, as far as our experience goes. But I would not say that weather conditions at Crescent Lake are at all serious and are going to prevent us from running a railroad there and interchanging business, or anything of that kind.

1906 We used our rotors on the Natron cut-off last winter very little. The winter before that we had this 12 feet of snow we used the rotors a great deal in the storms. We have two plows that are practically new, and one of an older and smaller type.

I would not urge that the weather was any bar to interchange at Crescent Lake. (3459.)

Mr. DEY. All my questions are designed to bring out as to the operation between Crescent Lake and Klamath Falls is the amount of snow, and so forth; and the testimony in your Cab Curtain case, I think, bears me out.

The Siskiyou Mountains are not in a class with the Cascades as far as severe weather conditions are concerned. Ordinarily we have much less snow on the summit of these mountains than we do on the Cascades and the Sierras. I have never seen over 6 feet of snow on the Siskiyous, and that was 17 years ago. Usually 2 or 3 feet of snow is the most found there. (3460.)

The Alturas line was planned and constructed to afford more economical operation by affording a shorter route to traffic that could move via Alturas, and to develop local business. By traffic I have in mind all the southern and western Oregon traffic, and the Klamath Basin traffic that will move east through Ogden, or from Ogden west into those territories. The Alturas route, could not be justified, in my opinion, in the absence of this through traffic.

Nearly 50 per cent of the earnings of the new construction were to be attributed to the savings attained by hauling business over the Alturas line rather than Roseville. (3461.) And this was giving full consideration to the optimistic views of traffic men who made surveys of what the traffic would be in the future.

Q. Now, then, what has happened since that time, since the set-up that we went into court on before the commission in the
1907 Klamath cases, what has happened with respect to that situation down there, if anything, that would increase or decrease the importance of this western Oregon business to support the Alturas line?

A. The Great Northern has come into Klamath Falls since that time and are also half owners of the branch line extending easterly from Klamath Falls, called The Oregon, California & Eastern, or Strahorn line. So that the amount of business that we had in our set-up in presenting our Alturas line case cannot now be realized, and it makes the savings due to rerouting traffic relatively much more important than they were in the former case.

Q. In other words, the Klamath Basin business that we then relied on as having exclusively for the Alturas line, from now on there, is now being and will hereafter be divided up with the Great Northern?

A. Yes. (3462.)

Exam. ROGERS. It seems to me that in speaking of the western Oregon traffic it might be well to separate the consideration between north and south traffic and western Oregon traffic going east.

Mr. DEY. In all of the questions I have meant, Mr. Burckhalter, and I assume in all of your answers with respect to western Oregon traffic we have been talking about, traffic which would move through Ogden east and west?

The WITNESS. Yes.

Exam. ROGERS. Well, was that true when you said 50 per cent of the justification for the Alturas route?

A. Yes.

No; I had not considered in that answer the western Oregon traffic going to California. That won't go over the Alturas cut-off. It will move, as to-day, through Black Butte, Dunsmuir, and south.

The Alturas line does not afford a shorter route than the
1908 present one for business Klamath Falls to California.

Q. (By Mr. DEY.) Now also in what we have been discussing, Mr. Burckhalter, the Natron cut-off was not considered, because that was completed and, in fact, we were ready for (3463) operation when the Klamath Basin cases were tried?

A. Yes.

Q. When we were talking about the Alturas route in these last questions and answers, we were referring to a line from Klamath Falls, Oregon, through Alturas, Wendel to Fernley, Nevada?

A. That is correct.

In the third year, between the Alturas and the Roseville route, we showed a saving of $432,000, resulting from hauling traffic via Alturas instead of Roseville. This would be approximately 6 per cent on $7,000,000.

I drew a comparison on what Mr. Newell's savings were in loads between the Roseville and Alturus routes, and found he saved $828,000 on 29,592 loaded cars, which is about $28 a car. Our estimate on 23,130 loads is $17.05 a car.

Q. Now is that the best showing that you could make when you were making a study of savings for presentation to the commission (3464) when we were asking for authority to build the line?

A. Yes, sir; that is the best we could make. Our figure is not quite comparable with Mr. Newell's figure, though, in that our study included some northern California business, on which the saving is somewhat less than on the northwestern Oregon business; so I would expect Mr. Newell's figure to be a little higher than ours under his different premises, but the figures I gave you show that he is 65 per cent higher than we were on the savings per loaded car, and it is my opinion that his savings are very considerably higher than they should be.

1909 I can't think of any advantages that could come to the Southern Pacific Company in joining in the construction of this cross-State line. The disadvantage will be measured by the amount of traffic that can be taken away from us at Crescent Lake, that we would otherwise handle ourselves for the long haul to Ogden. (3465.) The Southern Pacific does not propose to let one car of that traffic get away from it if it can be helped.

The Southern Pacific undertakes to serve what we commonly call western Oregon, lying west of the Cascade Mountains, from the Columbia River to the southern border of the State of Oregon, and also in the Klamath Basin and the territory up as far as Cascade

summit, east of the Cascade Mountains, and in such country as may be tributary to that line; that is, the timber that may be tributary to the line between Cascade summit and Klamath Falls, even though it be out of the Klamath Basin, so-called.

Q. In other words, the timber belt that extends for 30 or 40 or 50 miles over toward and beyond the Great Northern line which parallels the Cascade line, there is a timber belt; that is or is not tributary to the Natron line, and how was it considered when the Natron line was built?

A. We considered any timber lying to the east of the Natron line, within a reasonable distance, say 30 or 40 or 50 miles, as (3466) tributary to that line.

Q. (By Mr. DEY.) Do you consider the central Oregon territory (3467) in discussion in this case, as territory that logically falls in the area that the Southern Pacific lines do or should be required to serve?

A. No. I think the land or location that would be traversed by the proposed cross-State line is not in the territory that we would naturally, or could be expected to, serve. By that I mean with the existing or future rails.

1910 Exam. ROGERS. Well, how do you arrive at what the Southern Pacific has proposed to do in the way of serving the public under the act?

A. I think we should be expected to build lines that are justified by the traffic offered.

Exam. ROGERS. Well, do you have in mind that some particular territory in the United States has been allotted to the Southern Pacific?

A. No; but the territory that we can conveniently reach, and where we can conveniently reach them and there is traffic to justify the construction, I think we should build the line. Now the idea I have about the High Desert is that there is not enough traffic to justify our building over there. (3468.) And we are not as near that territory as the Great Northern or the Union Pacific.

Comr. MCMANAMY. Then does that mean that if that section of the country is to have railroad transportation, that one of the lines that is nearest to it should be required to provide that transportation, but that it should not be required or authorized to extend its lines into some of the traffic which surrounds that section?

A. I don't know that I fully understand your question, but if I do understand it my answer is this: That I don't think it is necessary, under the present development of the art of regulation, for one railroad to duplicate another, and I don't think it should be done unless there is enough traffic, and a growing traffic that will justify the incoming of the second railroad. I don't think any railroad should, in the present state of the art, be built, like as was testified to here the other day, the Oregon Electric built down here and did

not create any business, took all of its business from the Southern Pacific. I think railroad investment should be along the lines
1911 of development nowadays, and not on the idea of dividing up traffic, where there is not enough to divide profitably between two carriers. (3469.)

There is not any question of dividing traffic over in this central Oregon territory that is involved in this case.

At the time the Natron cut-off was built, the Siskiyou route was not handling its maximum capacity. It could have been fixed up to handle much heavier business than it is capable of carrying today. That is a (3470) question of putting in more sidings and appurtenant facilities.

The situation is this: That through litigation our completion of the Natron cut-off was delayed some 13 years. The project lay dormant about 10 years. In that interval we had yet to close the gap between Kirk and Oakridge, and during this time traffic moving over the Siskiyou line very greatly increased; so much so that it was necessary during the period the Cascade line lay dormant to very extensively add to the facilities on the Siskiyou line to give it an increased carrying capacity. We spent probably a million and a half to two million dollars on that line during this interval to give it increased capacity. From the standpoint of prudent investment it was necessary to spend this sum because we were building, or expected to build, the Cascade line and we did not want to run our investment in the Siskiyou line up any higher than was necessary. (3471.) No improvements have been made on the Siskiyou route since the Natron cut-off was built or closed up, in the way of increasing its capacity.

We could not handle over the Siskiyou route all the traffic that we are now handling over the Siskiyou route and Cascade line and give nearly as good service. The fundamental reason for closing up this gap in the Natron cut-off and placing in operation the Cascade line, going way back in early history, was to get better line, lower grades and curvature, with consequent economy in operation. (3472.)

1912 I have examined Exhibit 16, being a purported study of costs and savings as among the Roseville route, the Alturas route, and the proposed cross-State route, by Mr. J. P. Newell. I have been studying this exhibit only two days, but I find a few inaccuracies. Referring to Table XII, page 109, I notice that the figure "77,234" in the column "Saving, Total, Via Proposed Route Via Alturas" is in error. That $72,000 should be $7,234.00. There is an error there of $69,000 in savings per this tabulation. (3473.) The decimal point is wrong, and it has been carried into the addition.

On page 109 of this table I notice that the total cost of loaded cars, as determined by Mr. Newell for a saving on the Roseville route as compared with Crane, compared with his saving of the Alturas route compared with Crane, totals up on Southern Pacific business $1,291,993.00 in the column headed "Total, Existing Route Via Rose-

ville." In footing all the items of cost in the third column from the right on pages 108 and 109, and footing the extreme right column, and correcting for this error of $69,000.00 I have just referred to, I get a footing of $463,150.00. The difference of those two figures is Mr. Newell's estimate of the saving that would result from the construction of the Alturas line as compared with moving the business over the Roseville line for the number of loads he is here dealing with. That number of loads is 29,592 and therefore, the saving, according to his figures, would be $28.01 a car. Our studies show the savings with slightly different premises, namely, including some northern California (3474) business, only turned out to be $17 a car. The twenty-eight is 65 per cent higher than seventeen, and I draw the conclusions that Mr. Newell's estimates are too high.

I would like to proceed in my own way, if I may, now, and further discuss the disagreement I have with this treatment made by Mr. Newell.

1913 I didn't understand the purpose of this Table XII. The savings are set up on the basis of hauling all the empties, and the figures do not again seem to be used. I am unable to find where Mr. Newell drew any conclusion about the totals that this exhibit would reflect.

I wish to direct my discussion hereafter on the basis of the Alturas line being constructed. Mr. Newell has carried through an alternate study—one is the savings over the Roseville route, and the other are the savings over the Alturas route.

Now, we are building the Alturas line, so I haven't taken any time to go into the Roseville saving figures, but I have directed my study to the Alturas line savings. (3475.)

I can't see the slightest possibility of the cross-State line being completed before the Alturas line can be constructed. I am going on the statement that the Alturas line is an accomplished fact in less than a year.

I have also neglected to make any study of those factors in the report that deal with the traffic in and out of Bend, which is Union Pacific, and I have paid no attention to it.

I have also made no effort to ascertain what our traffic people may conclude as to Mr. Newell's traffic figures, that is, business originating, and so on, but I accepted his figures in that regard, subject, however, to any proper correction, if there be one, being made to his traffic figures in the event our traffic or other traffic witnesses showed them to be in error.

I accept as moving all that he claims will move, and the way he says it moves, as to the loads. (3476.)

(A statement was here received in evidence, marked "Defendants' Exhibit No. 103, Witness Burckhalter.")

1914 This exhibit shows some figures as to the interchange of cars as between the Southern Pacific on the one hand and its connections at Ogden, Utah, on the other hand, during the year 1926. I have excluded from this statement the interchange

of refrigerator cars, which went up to around 70,000 cars and I thought would distort the picture to include here, because the number of cars moving in and out of Oregon is a relatively small percentage of the total, (3477) and also Mr. Newell does not move refrigerator cars out of southern Oregon in his final study of the cross-State line case.

For the same reason, I excluded tank and stock cars. The stock cars are usually interchanged locally. There is very little interline movement of stock cars, and when such does occur out in the western country it is usually immediately balanced up by the return of equipment. The tank cars moving between Ogden and Oregon points are few. Tank cars are usually and mostly employed in the transportation of oils, which, as far as our lines are concerned, are moving in loads from California to Oregon. So I have reduced this statement to box, oil, coal, and flat cars, and it will be noted that the combined interchange will run about 119,000 cars that I am dealing with.

Now, starting at the bottom, with flat cars, the bottom of the first bracket, the least numerous class, it will be noticed that there are very few flat cars involved in the interchange, and that the empties received west were 433 and the empties delivered east were 525. I draw the conclusion from that that there were no empty (3478) flat cars hauled from Ogden to Oregon.

Taking the coal cars next, it will be observed that the coal cars come to us in the received column to the number of 7,892, whereas we were only able to load back 1,668, that we received 417 empty coal cars and that we delivered to Ogden 6,099 empty coal cars, from which it is also apparent that there were no empty coal cars hauled from Ogden to Oregon. Any coal cars that were wanted in Oregon were manifestly hauled from California from
1915 among this 7,892, after they had been unloaded.

There is a considerable movement of coal from Utah points into California coming out the Union Pacific and the Rio Grande railroads.

I have taken box and auto cars and set them down in the lower bracket and there combined them for purposes of further study, because I regard box and auto cars, as commonly termed, house cars and interchangeable, and I think to simplify the discussion we can combine them without any error.

As to box and auto cars, which are in the lower bracket of the exhibit, it will be noticed that we delivered an excess of those cars in the year 1926 to our connections at Ogden of 14,465 cars, so that it is very evident that there weren't many empties hauled west out of Ogden. I show the number of empties that were hauled west out of Ogden. There (3479) were 6,141, and there were hauled east into Ogden 3,063. That makes a net of about 3,000 cars that were hauled west out of Ogden. I conclude that all of those cars hauled west out of Ogden, box and auto, were undoubtedly used locally in Nevada.

I find that in 1926 we loaded 5,668 cars of lumber on our so-called Fernley branch that went out through Ogden. The Fernley branch

is the line from Fernley to Westwood. However, if a few of those cars did trickle into Oregon they would very manifestly be readily consumed in loading in southern Oregon or in the Klamath Basin.

It will be noted, according to Mr. Newell's exhibit, page 110, that he shows the Klamath Basin needs 4,480 empty cars for forest products, and that Jackson and Josephine Counties require 6,300. In this study he hasn't figured on taking out over the Crane line any of the business from Klamath County and Jackson County in his final set-
up where he goes into the question of net earnings.

1916 No; Jackson nor Josephine nor Klamath Counties were not included. These counties, in 1926, required about 6,800 empty cars for forest products. I draw the conclusion from that, Mr. Commissioner and Mr. Examiner (3840) that there were no empty cars of the type box, auto flat or coal hauled from Ogden in the year 1926 to Eugene or points north, that is, we didn't haul a single car from Ogden of those classes to Eugene and points north.

It is manifest that empties are needed in Oregon in large volume to take care of the forest products and other products moving out of Oregon via Ogden.

Mr. Newell shows in his Table XII that there were 25,992 loads moving east through Ogden and only 1,226 loads moving west; therefore, there was a decision in the westward movement of 24,766 cars for the Oregon business itself. Now, those cars have to be provided from elsewhere. It is manifest we didn't get them at Ogden, because we delievered more cars at Ogden than we received at Ogden. We didn't get the cars at Portland, because our interchange at Portland for the year 1926 shows that we lost 1,021 house cars at Portland gateway.

Lumber usually moves in box or auto cars from this territory. (3481.) We lost that many cars in the interchange in 1926; they came from California.

Comr. McMANAMY. To what extent will they be made empty in southern Oregon, in the Klamath Falls zone? Do you have many loads going in there?

A. Well, I used Mr. Newell's figure on that. He shows that the loads coming through Ogden in 1926 totaled 1,226 cars, and after discarding the business that he figures would move through Ogden after the cross-State line was built he concludes that 788 of those cars would come in over the cross-State line. That is shown in his Table XXI, page 141.

We moved a very large number of empties into Oregon in 1926.

We moved of box and auto cars about 35,000 empty into Oregon
1917 through Ashland and Crescent Lake gateways.

Now, turning back to Mr. Newell's exhibit, he shows on Table XII that he moved 24,766 empties west, on which he claims a saving of $327,120.00, moving them over the Crane route as against the Alturas route. Now, he cannot claim that saving, because the cars didn't move over the Alturas route, and they didn't move over the Roseville route. (3482.)

On page 141, Table XXI, that is the first year of operation of the cross-State line compared with the alternative of the Alturas line, Mr. Newell moves east via the cross-State line cars based on the 1926 estimate that are now moving through Ogden to the extent of 17,284—that is loads—he moved 788 loads over the cross-State line into Oregon through Crescent Lake, which will leave him a deficiency of cars at Crescent Lake of the difference between those figures, of 16,496. Mr. Newell will not balance his interchange at Crescent Lake under the set-up of this Table XXI by 16,496 empties. He has made no provision that I can find to get those empties to Ogden to handle this business, and it is obvious that the picture is useless unless the business that the cross-State line is supposed to take out of Crescent Lake will be furnished cars with which that business can move. It cannot move without the cars.

Now, Mr. Newell in his study makes the very particular (3483) assumption that for every load he takes east out of Oregon he hauls back 6/10ths of a car as an empty. Now, his Table XXI is set up on the theory that he hauled 60 per cent of the number of loaded cars, which is 17,284 west as empties—that would be 10,370 cars—for which he has included a saving cost on hauling the empties into Crescent Lake. He didn't haul them into Crescent Lake, and they are not now moving to Crescent Lake through Ogden.

The cars could be moved to Crescent Lake in the future, following the construction of the cross-State line; if the Union Pacific 1918 and other interested carriers in that group would send their cars over there, they could certainly be moved, in which event Mr. Newell's set-up here would have to be charged with the cost of moving those empties into Crescent Lake.

The empties which originate primarily in southern California we would turn back to our connections, and we would save hauling some of these even as far as El Paso. (3484.)

In Mr. Newell's first-year table he has erroneously included a saving credited to the cross-State line of hauling 10,370 empties at $17.43 per car, which, roughly, equals $180,000.00. He can't claim that credit, because the cars didn't move. Now, if he is going to bring those 10,370 empties into Crescent Lake across the cross-State line, they will, as far as my judgment will determine, have to come all the way from Omaha. I believe that the Union Pacific and all these northern lines are now hauling empty box cars west all the time, because of the large tonnage of lumber moving out of this country, and that any additional empties hauled by the Union Pacific into the Pacific Northwest will simply mean that many more cars hauled from Omaha.

Now, Mr. Newell shows on page 75 that it costs $130.05 to haul an empty from Omaha to Crescent Lake. If he hauls 10,370 empties from Omaha, multiplying that number by $130.00 a car, it will cost $1,348,000.00. That added to $180,000.00 erroneously claimed results in a charge to this account of over a million and a half dollars that has not been put in there, and will entirely wipe out that net saving

and throw the thing far into the red—on the empty car item alone. (3485.) I am stating to you that I think Mr. Newell's figures are too high, but for the purpose of this analysis I have used them, but I have shown where he didn't take in the elements of this problem that pertain to the handling of furnishing empty cars to handle this business over the cross-State line.

In a similar way, I have corrected Table XIX, page 136,
1919 that being the fifth-year business. In this table the total cars moving east over the cross-State line is 2,506; and west he moves 1,182 loads. The difference between these figures is 23,883 cars, which is the deficiency in the interchange at Crescent Lake.

Mr. Newell erroneously credits himself with an alleged saving of hauling empty cars west in number 60 per cent of the loaded cars east, that is, 15,039 cars, multiplied by his saving per car of $17.43, results in $262,000.00, but he has to get 15,039 cars and more west to Crescent Lake, and, as I explained in the other instance, so far as I can see they will have to be hauled from Omaha, and possibly beyond, and 15,039 cars (3486) at $130.05, of hauling an empty from Omaha to Crescent Lake, results in a charge of $1,956,000.00, which added to the $262,000.00 makes a charge of, in round numbers, $2,200,000.00 against the cross-State line that Mr. Newell hasn't taken into account in his study. That amount wipes out any alleged savings that he has proposed, and throws the project away into the red ink. (3487.)

Mr. Newell sets up very definitely the number of loads he is going to haul east and the number he is going to haul west. He doesn't say where he is going to get these cars, but he takes into his calculation an estimated saving on hauling empties through Alturas as against Crane to the number that 60 per cent of the loads east represent empties west; that is, that 60 per cent of the cars going east over the Alturas route are going to come back over the Alturas route empty, as against 60 per cent of the cars going east over the Crane route are going to come back over the Crane route; but I have shown that those cars are not coming through Ogden, therefore, he can't claim that saving. (3488.) In order to carry out his calculations he will have to find out where he gets the empties and have to take into his cost study the cost of getting them there and compare it with the present cost of getting them there, which he hasn't done.

1920 Generally speaking, California originates its traffic in perishable cars. The central valleys in the northern part of the State and in the southern part of the State produce a great tonnage of perishable traffic. I believe it is something like 140,000 cars a year. On the other hand, California doesn't originate a great deal of traffic in house cars. On the contrary it consumes more traffic coming to it in house cars than it ships out in house cars. (3489.) Thus house cars accumulate, particularly in southern California. Because of this tremendous refrigerator shipment out of the State all of the lines are obliged to haul empty refrigerators to California by the thousands, and their load factor is extremely low—less than 15 per

cent, I think—so we have the "refers" moving east loaded and west empty, and we have the box cars preponderating west loaded and would tend to go east empty in part, although they are, of course, partly loaded.

Now, we are able through the box cars and auto cars that we make empty in southern California and that we can get from our El Paso connections, to gather up those cars and bring them up into Oregon to maintain a car supply for what we take out through Ogden. My conclusion is that nearly all of these cars came from southern California, and had they not come back to Oregon they would have been returned to connections in southern California (3490) or at El Paso, and some empties that were hauled through to El Paso would not have been hauled from El Paso.

Unless we can keep our gateway interchanges pretty well balanced, we drain equipment away through a gateway, and that leads to serious complications. In the long run we have got to keep our gateway interchanges pretty closely balanced. That is not only year by year, but day by day, when business is good, and week by week, and I can't imagine a condition, a set-up like Mr. Newell has set up
1921 here, of bringing in just a handful of loads west and expect to take many thousands east without providing the cars with which to do it. It is very obvious that the Southern Pacific is not going to charitably haul these cars up from southern California and load for the Union Pacific to haul them east through the cross-State line.

Yes, Mr. Newell contemplated hauling 6/10ths of a car empty west for every loaded car he hauls east over the Crane line, and he took into his account a saving of $17.43 for each of those cars; but those cars didn't move. He credited the cross-State line project with that saving; (3491) a saving which never could occur, because the cars didn't move. The only way it could occur would be to actually haul those cars out from Omaha over the cross-State line—Omaha or elsewhere; then he would have to take into his calculation the cost of hauling those cars out for which he has got nothing now, and that cost runs into tremendous figures, because, according to Mr. Newell, it is $130.00 for each car from Omaha. Mr. Newell's saving is computed on the basis that the cars now move empty west either by Roseville or Alturas to western Oregon? And they don't move there. I didn't complete the figures of what his final Table XXII would be, but if I made the deductions that I have mentioned, his total error on this empty car movement would be in the minus quantity very heavily. (3492.)

You can't save any time on empties on the cross-State line unless you haul them across the cross-State line. Your saving there will not be a cumulative saving. When your mass of empties is shortened up by whatever that amount may be, if any, of a 200-mile shorter haul, that is the end of it.

Our cars that are loaded in western Oregon and go out through Ogden would be returned to us under load or empty at Ogden (3493)

or at some other junction of our line. We might get the car back in Texas, at El Paso. When the car is made empty in the east
1922 it can move various ways, as long as it moves in the direction of our line. There is a provision that interchange must balance car for car in switching interchange in a city and in a short movement, but not as to long-distance traffic. For instance, if we were moving gravel from Salem, Oregon, to some point here on the Oregon-Washington Railroad & Navigation Company, we would keep those cars in rotation and we wouldn't be privileged to return them to some other junction. We would have to return the cars, and they would have to return our cars to Portland.

There are two A. R. A. rules for interchange, one for short-haul cars and another for long-haul cars; there is an exception. The broad rule reads to any junction, and the exception is that cars moving locally will have to be returned to the local junction, as I remember it.

Comr. McMANAMY. What is the rule with respect to return of cars? (3494.)

A. The rule is "Foreign cars at home on a direct connection must be forwarded to the home road loaded or empty, except as provided in paragraphs E and F. If empty at junction with the home road and loading at that point via the home road if not available, they must, subject to rule 5, be delivered to it at that junction, unless an exception to the requirement be agreed to by roads involved. Otherwise cars under this rule may be (a) loaded via any route so that the home road will participate in the freight rate, moved locally in the direction of the home road, or moved locally in an opposite direction from the home road or delivered to a short line or a switching road if to be loaded for delivery on or movement via the home road, or delivered empty to the home road at any junction point, subject to rule 5, or delivered empty to the home road from which originally received under load at the junction where received, if such road is also a direct connection of the home road, or returned empty
1923 to the delivery road when handled in switching service and the owner is not a direct connection in that switching territory."

Now, this rule 5, which is made the exception:

"If the movement of traffic requires return of empty cars to home road via the junction to which cars were delivered in interchange, but under load, the home road may demand return of empty cars at such junction, except that cars offered a home road for repairs in accordance with provision 5, Mechanical (3495), M. C. B. Rules, must be accepted by owners at any junction point."

Comr. McMANAMY. Broadly speaking, isn't the purpose of that rule that cars delivered to foreign line under load must be returned to the home road either under load or empty, and if empty via the same route over which the load was carried?

A. That is the general idea, yes, sir; but it is permissible to bring it home through other junctions empty.

Exam. ROGERS. That is, that must be done if the carrier originating the traffic insists on it?

A. Yes; and in a general way the railroads are insisting that their interchanges be fairly well balanced. My understanding is that the commission is insisting on that, too.

Yes; the rule is definite with respect to the return of cars empty regardless of whether the home road insists on it or whether it doesn't.

Comr. MCMANAMY. In other words, if you deliver certain cars to the Chicago and North Western Railroad or the Union Pacific Railroad the rule governs the return of those cars. You don't have to go to the Union Pacific Railroad and say, "We want those cars returned through the interchange point at which they were delivered." Naturally, in the conduct of business those cars would be returned that way?

A. They generally come back through the same gateway,
1924 but the rule says "deliver empty to home road at any junction point (3496) subject to rule 5." That is paragraph (d) of rule 2. Sometimes, you know, a railroad is perfectly willing to take empty cars at a junction not through which the car went out under load. Sometimes it is a mutual advantage, depending on the accounts of traffic that are paid at the season of the year, and cars wouldn't be needlessly cross-hauled to return them to the same junction to which they were received if it would satisfy the convenience of both parties to effect an interchange.

Comr. MCMANAMY. When a car is loaded out of the line of return movement and is returned via any other route than the one over which the car has moved loaded, there is a charge for the excess haul, isn't there?

A. No; I don't understand that there is. A car can be loaded back to the owner so that he will participate in the business.

Comr. MCMANAMY. I am not speaking of a car loaded back to the owner.

Exam. ROGERS. You can short-route the cars home by the payment of a mileage rate, can't you, and deliver it at any junction?

A. Oh, yes; you can short-route the cars if you pay for it. We haven't done any of it that I know of, but I think it is done, and I don't see any reason why it couldn't be done. I don't see where it is involved here, though, in this case.

Comr. MCMANAMY. There isn't much in this case that isn't (3497) involved.

Mr. DEY. Now, is or is not the Southern Pacific Company in a better position, from the standpoint of economy, to furnish the supply of empty cars for the western Oregon lumber traffic than any other carrier operating in this territory?

A. I believe we are. As long as conditions are as at present,
1925 or as they have been in the last several years, I believe that we can get empties into Oregon more cheaply than anybody

else, for the reasons I have explained, that they accumulate in California.

Exam. ROGERS. Well, this matter of car shortage, I rather presumed from the statements of the witnesses that these cars were rather in shuttle traffic between western Oregon and the east—when made empty east they come back to western Oregon. Is that true or not?

A. You mean that an individual car holds to that route for a round trip?

Exam. ROGERS. Yes. I know you might have some individual cars, but whether the general run of cars that go east from western Oregon come back to western Oregon when they are unloaded in the east?

A. Under the car service rules, if we have a Rock Island car, (3498) for example, at Los Angeles—and we get a good many of them there, because the Rock Island is our Tucumcari connection—we can bring that car to Oregon and load it out through Ogden if the Rock Island gets some haul on it, say from Council Bluffs to Chicago. May I just say in that connection that we haul a great many foreign cars up into Oregon to get loading for them and send them on east again, in lieu of turning them east from southern California empty.

I can't tell you what percentage of the cars loaded by the Southern Pacific in western Oregon are of Southern Pacific owner-
1926 ship, but I can tell you what the interchange is at Ashland in empty cars, if that would help you any, as between system and foreign. In 1926 the lines south of Crescent Lake and Ashland, Southern Pacific lines, delivered to the Portland division 10,215 empty system box cars and 19,546 empty foreign box cars—practically two for one. Now, as to auto cars, the number was, system cars, north, 511, and foreign empty auto, north 4,798. (3499.)

Q. (By Mr. DEY.) Now, those cars were brought into Oregon, in the main loaded with lumber, taken east through Ogden, and eventually reached their own lines?

A. Well, those cars when coming to the Portland division were available anywhere that their ownership allowed them to go. The foreign cars naturally were used mostly to afford cars for off-line shipments through Ogden. The system cars, generally speaking, rotate on the system. It would be the foreign cars that were brought to the Portland division that would in preponderance go to the other lines.

When those foreign cars reach their owners in the East, they are loaded by them and they send them anywhere that they choose when they get on the home line—they may be sent south or to the Atlantic coast or anywhere else.

Yes, it is a fact that there is a constant flow, in a circle, entering our territory through Tucumcari and El Paso, being unloaded in southern California, brought up into Oregon, and then sent out through Ogden.

I think I have testified that we accumulate these cars in southern California, from our connections at El Paso and (3500) Tucumcari, and explained how the cars are made empty in southern California and are brought to Oregon. I guess I didn't complete
1927 the circle.

Mr. DEY. Mr. Corey testified in this case, Mr. Burckhalter, that there had been no car shortage in Oregon since the completion of the Natron cut-off. Does that tell the whole story, and, if not, why?

A. No, I think not. I think there has not been a car shortage for three or four years prior to the completion of the Natron cut-off.

Cross-examination:

Q. (By Mr. MCCULLOCH.) Will you turn to Exhibit 103, please, and name your company's connections at Ogden?

A. They are the Union Pacific, the Oregon Short Line, and the Denver & Rio Grande.

Q. Are coal and flat cars used for lumber loading from western Oregon, as well as box cars?

A. They are used in very small number for loading out through Ogden. However, the point I made on that was that they were (3501) not hauled empty through Ogden to Oregon. They were hauled empty from California to Ogden, by reason of the fact that so many loaded cars came West as compared with the very few loads that go East.

1928 Q. To and from California how does the loaded and empty movement compare? That is, on the Northern lines from the East the empty car movement westbound very much exceeds the empty car movement eastbound, I have heard testified a good many times. Is that the situation so far as California traffic is concerned?

A. Between Oregon and California?

Q. No, no, between the East and California.

A. Well, I gave you the picture of it at Ogden here. The number of empty cars of the classes I have dealt with received from all the connections at Ogden were 6,991, compared with 45,574 loaded cars, notwithstanding that that gateway was underbalanced, and we delivered an excess of 14,000 cars to the Ogden gateway of those classes, which would normally mean a very heavy balancing empty haul, but it didn't occur. We sent more cars east through Ogden than we received west by 14,069 on the Ogden gateway of those classes, which would normally mean a very heavy balancing empty haul, but it didn't occur. We sent more cars east through Ogden than we received west by 14,069 on the four classes, box, auto, coal and flat; notwithstanding that fact, we only received slightly under 7,000 empties west.

Yes; we delivered empty in that year to our connections at Ogden 9,687 cars. (3502.) And you will note that the big figure there is coal cars. That comes from the fact that we haul a very considerable amount of Utah coal into California, principally for domestic con-

sumption, and we are not at all able to find loading for those cars back, and we have to haul a great many of them back empty.

Q. Well, how would this picture shown in this exhibit be changed if you included refrigerator cars and tank cars?

A. Well, I will be glad to give you the figures. I have them here separately for the three carriers, and I didn't put them together, but I can read them into the record. I think I will first deal with the Union Pacific, because that is our principal connection at
1929 Ogden. In the year 1926 we received from the Union Pacific 9,151 loaded refrigerator cars and 55,504 empty refrigerator cars. We delivered to the Union Pacific 67,366 loaded refrigerator cars and 11,057 empties. That makes a total received 64,655, and a total delivered of 68,523, or an excess delivered of 3,368 cars for the year, excess delivered to the Union Pacific.

Now, the same cars we received, if you don't want me to take the time as between loads and empties, we received from them 1,800 tanks and gave them 1,772, and the balance at the end of the year was 28 received in excess of that number delivered. (3503.) We received an excess of tank cars by 28, loaded and empty. You understand that 28 cars—a day's business might balance that up. That is about as near nothing as you can get. (3504.)

Exam. ROGERS. As regards tank cars, where are those tanks going? Are any of them coming up here?

A. Well, we received 402 tank cars from the Union Pacific loaded, and we delivered them 1,404 loaded foreign and 15 system. Those cars are moving eastbound, principally commercial oils, not only fuel and gasoline but some cocoanut oil and things of that kind. West I think the business is mostly oil also. That represents some cross-haul. There is only 402 cars in the year—maybe some acid. Do you wish the stock cars now?

Q. (By Mr. MCCULLOCH.) Well, is there any substantial or heavy movement of stock cars?

A. The stock car movement was 1,986 received and 1,913 delivered; excess received 73. As I endeavored to explain when I first talked to this exhibit, I left those tank and stock and refrigerator cars out because I didn't think they would help the picture.

1930 Q. Yes. Now those were merely for the cars delivered to and received from the Union Pacific Railroad?

A. Yes. Now I can give you the Short Line.

Q. Or also the Short Line?

A. No; that is the Union Pacific itself.

Q. Yes; all right. (3505.)

A. Now we have a separate interchange for the Short Line, if you want it—the interchange of refrigerator cars—off the record, please. I am going to give you these figures rather briefly, and if you want them in more detail we can put them in. We received from the Oregon Short Line of loaded and empty refers 1,003, and we delivered them 1,501, an excess delivered of 498. Stock cars: We received 799 and delivered 790; excess received 9. Tank cars: We

received 179 and delivered 165; excess received 14. This is all the year 1926 I am giving you.

Denver & Rio Grande, refrigerator cars, total received 399, total delivered 1,949; excess delivered 1,550. Stock cars: Received 684, delivered 670; excess received 14. Tank cars: Received 87, delivered 104; excess delivered 17. (3506.)

Q. Now this Exhibit 103 would indicate that the Southern Pacific delivered to its connections at Ogden more traffice for the year 1926 than it received at Ogden from those same connections by something over 11,000 cars. Is this representative, this year's statement, of the general relative proportion of delivered and received traffic at
1931 Ogden in other years, would you say? I am speaking now from the standpoint of delivering more business there than you get back.

A. It is generally representative; and that effect is tremendously augmented above the effects here shown when you take the refrigerator traffic into account.

Q. All right; that is what I had in mind, in addition to the figures shown on this exhibit. Now keeping in mind your Sunset route, and via that route, does the Southern Pacific carry east and turn over to its eastern connections more traffic than comes in over that route and reaches destination in California?

A. Yes.

Q. So that by both routes the traffic of the Southern Pacific finding destination in California is substantially less than the traffic originating in California and moving east and delivered to various eastern connections?

A. That is true. (3507.)

Exam. ROGERS. In what kind of cars, Mr. Burckhalter? What kind of traffic is that true on?

A. Well, it is very preponderatingly true as to refrigerator traffic.

Exam. ROGERS. Well, suppose you exclude the refrigerator cars, then what is the situation?

A. Well, the situation at Ogden is as shown on my exhibit for the year 1926. I haven't made an exhibit of El Paso. I can tell you as to box and auto cars at El Paso, that in 1926 we received 11,741 plus 37,621 loads west, and we delivered east 31,980 loads. So as to the El Paso gateway we received more loads west than we delivered east in house cars, box and auto cars—about 18,000.

Q. And have you any figures for that same year as to the interchange at Tucumcari with the Rock Island?

A. Well, I should correct my statement by saying that these
1932 last figures I used were both El Paso and Tucumcari combined—I think of that as one gateway.

Comr. MCMANAMY. Tucumcari cars all go through El Paso, don't they?

A. That is the point; yes, sir.

Q. (By Mr. McCULLOCH.) Well, what I had in mind at the beginning, in asking you these questions, was whether the loaded (3508) movement to or from California preponderated westbound or eastbound via both routes, the Sunset route and the Ogden route. Taking it all together, in all kinds of traffic, year in and year out, what is the situation? Does the westbound loaded movement preponderate, or the eastbound loaded movement? I am referring to all your carload traffic, in refrigerators, tank cars, everything else.

A. The refrigerator cars move out of California in very strong proponderance loaded as against coming west empty. That is because, as I say, all the railroads load some 130,000 or 140,000 carloads of perishables in refrigerator cars to go east.

Now as to the box cars, my exhibit shows box, coal, auto, and flat—my exhibit shows that in the year 1926 there were about 11,000 more cars went east than came west through the Ogden gateway. I have just told you that in the same year at El Paso about 18,000 more cars came west than went east in box and auto cars. Now does that answer your question?

Q. Well, I got the impression from your testimony that the westbound loaded movement into California, and particularly into southern California, was such that you were able to (3509) supply, when those cars were unloaded in southern California, a constant stream of many thousands of empties for lumber loading in Oregon.

A. Yes.

1933 Q. That is, that you could supply the needs both of California shippers for loading east and of western Oregon shippers for loading east, from the cars that were made empty in southern California, that had come loaded from the East into southern California. Now was that what you intended?

A. That is generally true. I don't confine myself to southern California. We get some cars in central California. But the point is that Oregon always needs far more cars to load east than it begins to supply itself by unloading cars that have come to it loaded from the East. That is shown by all interchange figures, and by Mr. Newell's estimate. He only has a handful of cars coming out loaded to Oregon, against probably 28 or 30 times as many going east loaded.

Now in general we have been able to accumulate the empty cars that we need to handle the business out of Oregon by bringing up the surpluses that accumulate in southern California and central California, and I believe at times we have hauled cars from as far as El Paso to help the situation out.

Q. Does this supply of empties that you have in central and (3510) southern California after the loaded cars that have come west are unloaded, supply also the needs of California shippers as well as those of western Oregon, for cars to be loaded for movement east?

A. The cars that come out, either loaded or empty, are available for loading. If a car comes out under load to California we can load

it back if we have the load there, from California, or we can send it up here to Oregon. But cars that come out, either loaded or empty, are available for loading in the opposite direction.

Q. I appreciate that, but isn't it a fact that in addition to the cars that are made empty in central and southern California that
1934 have moved west loaded, the Southern Pacific constantly is bringing empty cars through the Ogden and El Paso gateways for the purpose of being loaded with California and Oregon products for shipment east?

A. Well, I have shown you on my exhibit just how many cars came empty through the Ogden gateway in 1926.

Q. Yes. Now, have you also shown how many came through the El Paso gateway?

A. No; I have not.

Q. Can you do that?

A. I can give it to you for box and auto cars. We received empty cars at Tucumcari and El Paso in 1926 to the number of 8,591, and we delivered cars empty through the same gateways (3511) to the number of 16,243. We delivered more than we received. This includes box and auto cars. I have the figures for refrigerators and other classes of cars, but they are not consolidated.

You will find that El Paso, as to refrigerator cars the situation is about like in Ogden. There is a tremendous preponderance of loads going in and very few loads coming west. Do you want those figures?

Q. Well, can't you give the movement of empty refrigerators westbound received by the Southern Pacific at El Paso or Tucumcari or both?

A. Well, I can give it to you, but it is a good many different places here.

Q. Well, could you compute it at noon, then, and give it after the intermission, if it takes some time now?

A. Yes.

Q. Is it a fact that, generally speaking, year after year there is a flow of empty box and auto, refrigerator, tank, and other classes of cars westbound, that the Southern Pacific receives at Ogden, Tucumcari, and El Paso?

1935 A. Well, there is a very pronounced flow of refrigerator cars (3512) empty. There is a very limited flow of the other kind of cars, as shown on my exhibit, in 1926, at Ogden. I have not reduced other years, but I think 1926 was quite a typical year as to the movement of empty cars—empty box and auto cars through Ogden.

Q. Would you say, Mr. Burckhalter, that empty box cars have not been, or are not being, moved from El Paso, or Tucumcari, or Ogden, empty for loading of lumber—moved empty into west Oregon for loading of lumber?

A. Well, as to individual cars, there may have been individual cars that were hauled through Ogden, but the true measure is the

net result, and I claim that in the net result there was not the equivalent of a single car hauled through Ogden empty in 1926 that helped to move anything out of western Oregon through Eugene.

As to El Paso and Tucumcari, it may be that none of them came through El Paso. I guess, from these figures I have just given you, we can't conclude that any of them came through El Paso.

Exam. ROGERS. How would El Paso be involved, anyhow? (3513.)

A. I don't think El Paso is involved from the standpoint of contributing empties to afford loading, or to afford cars for loading on Oregon lines, except to the extent that empties might have come through there. I think there were not any, in fact, on the year's basis, that came through, because I have shown we received only 8,591 as against 16,243 delivered at El Paso.

Exam. ROGERS. What I have in mind, Mr. Burckhalter, is if the cars are going to continue to come through El Paso empty, there is no way of effecting this saving on the cross-State line on these empties?

1936 A. No; that is very true. The cross-State line, whether built or not built, is not going to have any effect that I can see on the movement of traffic through the El Paso gateway.

Q. (By Mr. MCCULLOCH.) Mr. Burckhalter, would there be any less cost in your judgment of moving an empty car from El Paso into western Oregon for lumber loading than of moving an empty car, as you assume, from Omaha over the Union Pacific system lines through Crane and Crescent Lake into western Oregon for lumber loading?

A. Oh, I think the cost probably is about the same per mile. (3514.)

Q. Well, you assumed that if the cross-State line were built and cars for lumber loading were moved west empty, that they would move clear from Omaha, didn't you, into western Oregon?

A. Yes.

Q. Are you less ready to assume that with the completion of the Alturas line empty cars for loading of lumber in western Oregon will not move empty from El Paso or from Ogden?

A. I think they will not move west from Ogden for loading Eugene and north, and that they will not move empty from El Paso.

Exam. ROGERS. In justifying the Alturas line, do you rely there on the movement of empties over the Alturas line to this western Oregon territory?

A. No. I think we will rely on moving the empties from central and southern California, as we do to-day.

Q. (By Mr. MCCULLOCH.) On this Exhibit 103, it shows for the year 1926 cars delivered that you received at Ogden from your connections; can you say how many, or what per cent of those cars delivered, were in southern California?

A. It would be very, very few. Under the commission's order in the Central Pacific case we are not allowed to solicit business
1937 for movement through the Ogden gateway for (3515) points south of the Tehachapi Mountains; so if any of this business moved from southern California it could only move without our solicitation, and I think the number of cars moving from southern California is very, very small—negligible.

I have been in the employ of the Southern Pacific Company at times when western Oregon was experiencing periods of car shortage. I could not say, in such periods, whether the Southern Pacific Company has ever moved whole trainloads of empty cars from El Paso to relieve the situation in western Oregon. When I was here in Oregon as superintendent, and that is when the car shortages were, I never knew where the cars came from, except they came to me at Ashland. I think they were principally originated at Los Angeles.

Q. Do you know anything, Mr. Burckhalter, of the ability of other carriers than the Southern Pacific Company to furnish empty cars to Oregon shippers, either in western Oregon or elsewhere in the State, for loading?

A. Why, I think the other carriers have the ability to furnish all the empty cars that they need to handle their business, just the same as we have.

Q. You don't know of the conditions on their lines in that (3516) respect as you do on your own, I assume?

A. I know generally that the neighboring carriers are able to supply their shippers with cars, and that we are also. I think that is a matter of common knowledge.

Q. What do you know of the empty and loaded car movement on the Union Pacific system lines to and from Oregon?

A. Well, I know what Mr. Newell has in his report; that is, I accepted it for its face value. That is on page 60.

Q. And what you know on that subject is what you find in Mr. Newell's report?

1938 A. Well, it is this way: I have heard a great deal of testimony, and I have figures in my files that show the gateway movements on all the Northwestern lines of the loads and empties over extensive periods, but I haven't them here. And I have checked them over repeatedly, and my impression is that their situation is about like ours at Ashland; that is, that we bring in about 60 empties into Oregon through Ashland and Crescent Lake for every 100 loads we take out; and my impression is that that is very closely the situation with all these northern carriers as to their Oregon and Washington traffic.

Q. With respect to your testimony on this empty car movement and its cost, is it your judgment that the cost of providing empties for western Oregon traffic will be more or less for (3517) movement over the Alturas route than over the cross-State route, assuming that line were built?

A. Well, if you will tell me where the empties come from, I would venture an opinion.

Q. Well, I thought as you had assumed that if a cross-State line were built and the traffic from western Oregon moved over it that the empties would come from Omaha, that you would be equally ready to assume where the empties would come from when the Alturas line were built, assuming that the western Oregon traffic moved over it.

A. The traffic will move over the Alturas line in empty cars that come just where they come from today. We are not going to change the situation as to empties by building the Alturas line, except that the few empties we might haul through Ogden, which I have explained on my exhibit, would be utilized to take care of traffic in Josephine and Jackson and Klamath Counties; if a few of those did come through they would naturally come Alturas instead of Roseville after the Alturas line was built. But I pointed out to
1939 you that I think all of these empties would readily be consumed on the Fernley-Lassen branch, and, therefore, that the cars loaded in Josephine, Jackson, and Klamath Counties would have to come from California, after the Alturas line is built, just as they come today. (3518.)

Q. Well, would you assume, then, that if the cross-State line were built, that the empties for loading lumber and other traffic to be moved east over the cross-State line, would come from the same sources, and in the same manner, and be supplied by the same lines, as the empties for the loading of traffic at points on the O.-W. R. & N. in Oregon and western Washington at the present time?

A. I would assume that if the cross-State line is built that the Union Pacific will have to haul enough empties into Crescent Lake, over the cross-State line, to balance the interchange.

I believe the Union Pacific would have to do this in order to balance the interchange created there by the construction of the cross-State line. That is, if they took 100 loads out of Crescent Lake, east, and brought in 10 loads delivered to us at Crescent Lake, then it would have to bring in 90 empties also to keep the interchange balanced. They don't have to do the same thing at Ogden because we have the cars in California and we don't want to (3519) haul them all the way from Ogden to Oregon when we only have to haul them from California to Oregon.

Q. (By Mr. McCULLOCH.) On what was your assumption based, Mr. Burckhalter, that the Union Pacific, in providing empties for western Oregon traffic, assuming the cross-State line were built, would have to haul those empties all the way from Omaha?

A. Well, that is where Mr. Newell hauled them from. He claimed a saving of 60 per cent all the way from Omaha.

Q. I think you are mistaken on that.

A. I also indulged in that assumption because the O.-W. R. & N. Company is already hauling empties, in very large volume,

1940 through Huntington today. Now, if they need still more empties, why, they are going to increase their empty haul. I don't know where they are going to get them short of Omaha.

Exam. ROGERS. Mr. Burckhalter, in considering the matter of saving as Mr. Newell has proposed the empties to move, would you also have to consider, if the empties were going to move via the cross-State line, the added expense that would be incurred in the movement of cars made empty in California and moving empty to the East, when loaded? What I have in mind is, you are going to have these empties in California, even though you do move the empties in across the cross-State line. As I understand your testimony, you are now able to utilize those empties made empty in California in loading in western Oregon? (3520.)

A. Well, from Los Angeles, for example, to Crescent Lake, it is 882 miles. If we haul a car today, like a Rock Island car, that is empty at Los Angeles, up to Crescent Lake, it is 882 miles. Now, if we hauled it back to El Paso it is 814 miles, when the Rock Island—or Santa Rosa—is about 1,000 miles. When we get it there the Rock Island would have to haul it several hundred miles further to get a load for it, undoubtedly; and it looks to me that whenever you try to follow this situation through as against not utilizing the empties in California for Oregon loading, that you just keep going from bad to worse all the time. I think the cross-State line cars brought out over the Union Pacific will have to incur at least the mileage from Omaha, maybe beyond, on an average. As against that, the surplus we hand back at El Paso and Tucumcari as comp'red with hauling it up here, will have to be taken by our connections there probably and hauled many hundreds of miles on east again, unless they find some way to cross-haul them, like in the Mississippi Valley or in the intermountain country somewhere. (3521.)

1941 Q. (By Mr. MCCULLOCH.) Mr. Burckhalter, I understand that traffic south of Divide, Oregon, now moves via Ashland and Roseville and Ogden east, and traffic north of Divide via Eugene and Crescent Lake; is that correct?

A. That is correct when the routing is left in our hands. There is some traffic of course that is routed through Portland, like the broccoli from Roseburg.

Q. I was speaking of unrouted traffic. What considerations determine that you would send traffic from points south of Divide via Ashland and Roseville, and traffic from north of that point via Eugene and Crescent Lake?

A. Well, the theory was that the traffic should be handled the easiest way from an operating standpoint; and it was on that basis that Divide was taken as a point north and south of which the traffic should flow through those different gateways—when moving to Ogden, for example. By easiest route, I mean the most economical and the most efficient route from an operating standpoint. (3522.)

Q. And would the factors of distance and time be important elements in determining whether a route was more efficient and more economical than another route—time in transit and distance of haul; would those be important factors in determining the efficiency and economy of one route as against another?

A. Well distance is a factor, when other conditions are equal; and time is a factor generally, not always.

Q. You compared the saving in distance via the Alturas route and via the Roseville route on pears from Jackson County. I understood that that saving in distance was 41 miles.

A. Yes. And I believe I said the saving in time was 11 hours on pears via those two routes.

There would be a saving of 212 miles on a movement of
1942 lumber from Klamath Falls to Ogden by the Alturas route as compared with the present Roseville route. I have not computed the saving in time. (3523.) It might save about a day, I guess; that is, providing it moves as lumber in slow trains.

Q. Well, is that the way lumber, or the great bulk of the lumber traffic from western Oregon does move?

A. There is a good deal of it moves in slow trains, and a good deal of it catches faster trains, filling out fruit trains, and so on.

I want to point out, though, as I did before, that on a long haul 100 miles or 200 miles is not anything that is going to prevent schedules being equaled by competitors.

Q. What do you mean by a long haul? How long would a haul have to be to make a saving of 100 miles or 200 miles unimportant as between routes?

A. Why, I think any of the haul on business going into transcontinental territory or intermountain territory; that is, say, Granger and beyond Granger, I don't think it would make any difference. On business where time was important and the business was (3524) solicited on a schedule movement, why, the road, whatever road it was, that had somewhat longer line would arrange to make the time. That is true anywhere.

Q. Yes. I understood you to say that the investment of approximately $6,000,000 in the Alturas line was being made primarily to provide a shorter and more economical through route to the East; that that was the primary consideration; is that correct?

A. I believe I said that originally the savings resulting from diverting traffic over the Alturas line accounted for nearly 50 per cent of the income we figured on the increased investment represented via the Alturas line, including the N. C. & O.; but that since that
1943 time the picture had changed somewhat and the Northern lines had come into the territory and probably now the saving we will make on diverting traffic through Alturas will be something over 50 per cent of the earnings we will get on that investment.

Q. Well, would it be fair to say, and correct to say, that the primary reason for the building of that line was to provide a shorter, more economical, more efficient route for the movement of through

traffic from the Klamath country and western Oregon to and from eastern transcontinental territories?

A. No; I don't think it would.

Q. What was the primary reason, then? The development of the country through which the Alturas line will pass, and the (3525) earnings to be anticipated from local tonnage originated by it?

A. I don't think that when the reasons are so nearly equal, that either one of them might be called primarily properly. As I have endeavored to explain, in the original set-up the savings through diverted traffic were a little less than 50 per cent of the estimated net income applicable to the investment, and now we think because of the Great Northern's entry into Klamath Falls that the savings on that diverted traffic will probably be a little more than 50 per cent of the net income on that investment. In other words, the reasons were pretty well equal.

Q. I see. That is what I wanted to know.

A. Before and after.

Q. All right. Would it follow from that that the Southern Pacific, in all probability, would not have undertaken the construction of the Alturas line solely for the revenue to be anticipated from tonnage that would be originated local to that line, if and when built?

A. I don't think they would have built it for the local business; not at this time, at least; that is, the local business alone.

1944 Q. Yes, Mr. Burckhalter, after the Alturas line is built and put in operation, how far south will it draw traffic from western Oregon for that route as away from the route through (3526) Ashland and Roseville, would you say? From an operating standpoint, how far south will it be desirable to go and take the traffic up north, through Eugene and Crescent Lake to Klamath Falls, and over the Alturas line, instead of sending it down through Ashland and Roseville east?

A. I could not say accurately. I have not made any investigation of that. We are to-day, as I say, breaking at Divide. We have left that in the hands of the local superintendent, and he tells me that is what he is doing. We ask him to use his best judgment as to which way he will move that traffic.

There is very little traffic originating between Roseburg and Divide, and such as there is, if moved through Crescent Lake, would have to be hauled uphill to Divide. So the superintendent is using Divide.

I have not made any study to show where the proper theoretical breaking point is between Eugene and Black Butte Summit as defining the line where the traffic should move, on the one hand, through Black Butte and Klamath Falls, and, on the other hand, through Crescent Lake and Klamath Falls, which I understand is your question.

Q. Yes; that is what I had in mind, whether it would move south, then up to Klamath Falls and over the Alturas, or whether it would

move north to Eugene, then through Crescent Lake and over the Alturas. (3527.)

A. Well, I haven't studied it, but in a general way I think that point would lie at Divide or Roseburg, or in between. That is a very general answer, though.

Q. Yes. After the construction and operation of the Alturas line, in your judgment will any traffic from western Oregon
1945 continue to use the Ashland-Roseville gateway, going east through Ogden? By western Oregon I mean anything north of the California-Oregon State line.

A. No, I think not, unless possibly the Medford fruit. As I explained, that might continue to go through Roseville; while I think the lumber tonnage, anything like that, would surely go through Klamath Falls and Alturas, where they are originated on the old Siskiyou line as well as on the new Natron line. The saving in distance is 41 miles. No doubt the equated distance would be somewhat longer.

Q. You mentioned, in computing the time in transit via the cross-State line, the Alturas route, the present Roseville route to Chicago on perishables from Jackson County and from Douglas County different aggregate periods for the time in transit, but then you went on to say that the schedule of all the competing routes would undoubtedly be the same, and if there were not enough differences in distance to make it (3528) impossible for any of the routes to meet any schedule that might be made; was that substantially what you said?

A. I think so.

Q. Now, does that situation come about customarily; by agreement between the competing routes to that end, or does the line that is most favorably situated as to distance and to give the shortest time in transit, fix the schedule and considerations of competition compel all their competitors to meet that schedule?

A. Well, speaking generally, if one line has a decidedly direct route, that line naturally makes the schedule. If, however, there are other lines who find it practicable to compete with the direct route, they do so.

Now as to these fruit schedules, the distances over the various lines out of central California and out of southern California do
1946 not vary greatly, and the schedules are made by conference with the railroads and shippers, and if the shippers like a prompt schedule the railroads agree to as prompt a schedule as they can, and they all agree to the same schedule, which is 154 hours out of Roseville, or Colton to Chicago.

Q. I was wondering in connection with these estimates of the time in transit to Chicago on broccoli from Roseburg via these different routes—via Portland you estimated it at 190 hours and via Alturas south through (3529) Ashland to Black Butte and then north to Klamath Falls 192 hours; via Alturas, coming north from Roseburg to Eugene and through Crescent Lake, 185 hours, and via Crane and

the cross-State line, 178 hours. Now in that situation would the schedule time for the movement of broccoli from Roseburg tend to be 178 hours—that is the time that could be made as you estimated over the cross-State line, assuming it were built—and would the fact that the time could be made 178 hours over that route make it likely that that would be the schedule established which the other routes would meet? That is what I was getting at and what I had in mind. In other words, would the existence of this shorter route via Crane and the cross-State line have the effect of providing a more expedited service over competing routes?

A. Well, these figures I have drawn up I regarded as what might be called a natural time to handle the business over the several routes, irrespective of the presence of the other routes. I got that by taking the several mileages, and, as to the movement over the Siskiyou line I used 11 miles an hour through, because that is the time we now have on the Medford fruit block. As to the other routes, that is via Alturas on the one hand and Crane on the other, I used 12 miles an hour in both cases. And by using that same miles-per-hour, I got this variation of figures that you call attention to. And then I point out that that difference is not (3530) considerable.

1947 It is not so much but what we could equal it through Alturas, or, if the tables were turned around, the Union Pacific could equal it through Crane.

Now, of course, to make any sort of a schedule like that you can't handle that business in a local train; you have got to put it in a through train to make about that time. I don't know whether the cross-State line would establish such a schedule. I was asked to figure up what approximate schedules might be, and this is what I have done, pointing out, however, all the time, that wherever the business is of any consequence no carrier that has a slightly longer line is going to foreclose the business.

Q. Well, if that is so, Mr. Burckhalter, and the cross-State line could and did establish a schedule of 178 hours on broccoli from Roseburg to Chicago, wouldn't that tend, then, to induce and bring about improved service and faster service down to the same basis over the competitive routes? Wouldn't it have that effect?

Exam. ROGERS. Isn't that a deviation from the hours you stated? Did you say 178 hours via the cross-State line and Crane to Chicago? I thought you said 187.

Mr. MCCULLOCH. No; 178 hours on broccoli from Roseburg via Crane to Chicago.

Mr. DEY. That was from Medford, Mr. Examiner. That was (3531) 187 hours from Medford by way of Crane on perishables.

Exam. ROGERS. Rogue River fruit; that is right.

The WITNESS. If the cross-State line set up a schedule of 178 hours, that would be about 12 hours faster than the business is enjoying to-day, and if they did that we would certainly meet that schedule, and, I think, get all the business.

These estimates of time in transit that I have made on pears and on broccoli are elapsed time clear through.

1948 There are icing facilities at Roseburg and Portland and Klamath Falls, Medford, and Ashland, but none at Eugene.

I could only give you a rough estimate of the time in transit of a slow train carrying lumber from Eugene to Ogden via Roseville, which is the only existing route now. A rough (3532) guess would be 10 miles an hour, including terminal delays, connections, and everything of that kind. We have no lumber schedule from Klamath Falls to Chicago that I know of. I have not made any investigation to determine the average or approximate time of a car of lumber in transit from Klamath Falls to Chicago, including the elapsed time.

I have no explanation of why all of the broccoli from the Roseburg district has not moved east via Roseville and Ogden instead of much of it via Portland. I believe Mr. Mulchay knows all about that.

It is 99 miles from Crescent Lake to Klamath Falls.

Q. I understood you to say that you expected to see more business for the Alturas line than for the cross-State line, if that should be built. Do you refer to local tonnage originated, or through business, or both kinds of business, when you said that? (3533.)

A. Both.

Q. You mentioned a delay at Crescent Lake due to the interchange at that point, if western Oregon lumber were turned over there by the Southern Pacific to the cross-State line, as compared with its movement east down to Klamath Falls and thence east over the Alturas line when built. Well, would trains carrying lumber from Eugene or western Oregon points move down over the Cascade line to Klamath Falls and right through Klamath Falls without being broken up and being put into another train for movement over

1949 the Alturas line? How would that lumber traffic be handled there? Would there be any delay due to an interchange or handling at Klamath Falls?

A. Yes; the business would be set out at Klamath Falls and picked up in an Alturas line train. But I drew the conclusion from the fact that I think the traffic would be heavier on the Alturas line and, therefore, the connections more numerous, and a one-company operation always can adjust itself to closer connections than a two-company operation. If the business left Eugene and it went across a cross-State line it would be set out at Crescent Lake. If they had one train a day there, why it would have to wait until that train went out. If it waited 5 hours or 6 hours, why our train would be in Klamath Falls by that time, I think. (3534.)

Q. Well, even if it was handled that way, then after it was put in the train at Klamath Falls would it stay in that train until it got to Ogden, or would it have to be taken out of the train and put in another train at some other point even before it got to Ogden?

A. Well, I think it is very likely that that business would move through from the line Alturas to Fernley, through to Ogden in one

train, that is, in the same train. But when it got to Ogden it would have to be interchanged there to go on east.

Q. Do you believe, then, considering a destination east of Granger, Wyoming, that there would be any more interchange service or any more delays incident to the handling of a car of lumber from Eugene at points where it would have to be taken out of one train and put into another if it moved over the cross-State line than if it moved down to Klamath Falls and then over the Alturas line and then through Ogden and east of Granger?

A. I think there would be considerably more delay, on an average, on the Crescent Lake interchange than on the Klamath Falls
1950 interchange; otherwise I consider the interchange situation as a terminal delay proposition equivalent after the business gets started out of Crescent Lake, on the one hand, and Klamath Falls on the other. (3535.)

Q. You would think that there would be nothing to choose between the delay due to interchange in handling beyond Klamath Falls or Crescent Lake to a destination east of Granger?

A. Yes.

Q. All right. Now, have you made any computation of annual savings that you anticipate will be effected by the use of the Alturas route on western Oregon traffic, instead of the existing Roseville route?

A. We made studies at the time of our application to the commission for the certification of public convenience and necessity to build that line. We haven't made any study since. That study showed a savings of $17.05 a loaded car, on 23,130 loads, for a period of one year. The total savings amounted to $393,300.00.

Q. (By Mr. McCulloch.) Which was the estimated annual saving on that movement that in the judgment of your company justified (3536) an investment of $6,000,000 to build this line, plus such traffic as it hoped might be originated locally to the line, is that correct? Or, plus the revenue from such local traffic as might be originated by the new line?

A. Well, our estimate in the former hearing before the commission combined the Nevada-California-Oregon, and the Oregon, California & Eastern and the Alturas line, and our exhibit was worked up on the basis of all of those things being included, and among the items affording earnings to justify the expenditure was this one of the saving on haul over the Alturas line. Now, it wasn't allocated entirely to the line Klamath Falls to Alturas because the business went on down to Wendel, then it was all lumped together in
1951 our exhibit, as I remember it. I don't think we made any allocation of it to the Alturas-Klamath Falls line by itself. The total saving by reason of diverted traffic was $432,000.00 on our exhibit.

Exam. Rogers. Have you made any calculations, Mr. Burckhalter, to determine what would be the result according to Mr. Nevell's

study if you handled the empties as you do now but handled the loads over the cross-State line?

A. No; we haven't made such a statement.

Mr. DEY. Well, you can give the elements, can't you? That is $180,000.00, the savings on empties would have to be (3537) deducted from his savings, would they not, in any event?

A. Well, as I understand your question, Mr. Examiner, the loads will move out over the cross-State line and the empties will move as now? Mr. Newell's figure under such a premise would be an error to the extent that he is claiming saving on moving the empties, which didn't move. As far as your question goes, I presume theoretically there would be no adjustment necessary providing the cars continue to move that way, but I don't see under what theory they would continue to move as they are moving to-day unless the Southern Pacific got the load out.

Exam. ROGERS. Well, Mr. Newell's study, as I understand it, was to the effect that the division could be so fixed that it would be more profitable to the Southern Pacific, they would make more money in the long run, to turn the loads over to the cross-State line at Crescent than they do now handling it to Ogden. I was wondering whether that was entirely offset by this empty proposition that you referred to this morning.

A. Well, Mr. Newell attempts to set up the savings that will result as he sees them through the connetcion with the cross-State line, and then having determined that amount of money he proposes to
1952 let the Southern Pacific earn as much net as it does now by readjusting its percentages as may be necessary and the balance of that saving will all go to the Union Pacific (3538) and be increased net for them, and he in turn assumes that that increased net will be a credit and a justification for the construction of a cross-State line. Now, his error comes in first in that he includes in his estimated saving resulting from the construction of the cross-State line, a saving of $17.43 on 10,370 empty cars which he assumes would come over the cross-State line, but which do not come over the cross-State line and do not now come over the Roseville and won't come over the Alturas line.

Exam. ROGERS. Well, Mr. Burckhalter, suppose that the commission in considering Mr. Newell's exhibit determined that you are right about the empty movement, that that isn't the way it moves—it moves through California—would that knock out entirely this proposition of Mr. Newell's proposition, as you see it, or would there still be left the proposition as to possible savings on the loaded movement?

A. As I see it, in any event Mr. Newell is in error to the extent the figure on saving on the empty cars that do not move otherwise there would be no further error if the commission in its wisdom under its power concludes to say to the Southern Pacific Company in the first place that "You will route all your business over the cross-State line that comes through Eugene, and you will haul all

the empties that are necessary to load that business from California to make that movement possible." Now, if you will say both of those (3539) things to them and they are valid instructions, Mr. Newell is right except to the extent of this correction I have referred to.

Exam. ROGERS. All right, now, we will assume for the purpose of illustration that the commission has authority to do both, and that they are going to let the empty movement go as you
1953 say now—the next question will be, will the commission find, "Well, before we do this will the Southern Pacific—Can we fix the divisions so that the Southern Pacific will earn as much under the new arrangement turning the traffic over at Crescent Lake as it did before in handling it to Ogden, bearing in mind that the Southern Pacific is going to handle the empties"?

A. Well, it seems to me that you couldn't logically do that, if you were requiring the Southern Pacific to incur empty car haul in excess of what ordinary good practice and the interchange rules require. In other words, if we could get rid of these empties that we are now able to assemble by a shorter haul, having lost this business out of western Oregon, you couldn't compel us to make a longer haul on them, it seems to me, without compensating us for that.

Exam. ROGERS. Well, I know, we are assuming those things, but I want to know what your calculation shows as to the cost or saving in routing your loaded traffic via the cross-State (3540) line and handling your empties as they are, whether there is any authority for putting that in effect or not. I just want to know what the result would be.

A. Well, my studies will show that, using Mr. Newell's prices, we will get the same results as he does after deducting the erroneous inclusion of saving on empties, which is about $180,000.00 in the first year and is $262,000.00 the fifth year.

Exam. ROGERS. What would the net result of that be? Would you make more money delivering it to them at Crescent Lake than you do now?

A. The effect of that is that Mr. Newell is claiming a saving in the first year of $180,000.00, and in the fifth year $262,000.00, which show respectively in his Tables XXI and XIX as "Net Revenue to the cross-State line," those amounts being in error that should be deducted in Table XXI and Table XIX, and would, using
1954 his own methods otherwise, correspondingly reduce his total net revenue to the line. Those figures were just deductible from the final conclusion here in Table XXII on the bottom of page 142. Taking the first year, if you please, and looking at the fourth column over, where it says "Return," there should be $180,749.00 deducted from that figure, and on the fifth year—I didn't figure it intermediate—the deductions (3541) should be $262,150.00 from the $835,842.00.

Mr. DEY. Well, after deducting that would there then be enough left to give the Southern Pacific what he now gives it and put the Union Pacific in the clear and give it its cost? Take Mr. Newell's set-up, and give the Southern Pacific what he now gives it on divisions, would mean cutting down the total divisions or revenues that the Union Pacific is going to get by one hundred eighty thousand the first year and two hundred sixty-two thousand the fifth year, wouldn't it?

A. Yes.

Mr. DEY. Now the question is, although it would take some time for you to figure it out, but it could be done—(3542 whether or not that took the profit away from the Union Pacific and left them in the red in doing business?

Exam. ROGERS. I want to know whether Mr. Newell's study, as you see it, falls because of the way he handles the empty mileage?

A. Yes; it falls, for two reasons—one, that he has claimed savings on cars that aren't moving, and second, because he has assumed that he is going to have enough cars go into Crescent Lake to balance his business without having provided any way for them to get there.

Exam. ROGERS. Well, the Southern Pacific is going to handle the empties, under my theory, and the Union Pacific the loads. Of course, I know offhand that sounds good.

1955 A. That is rather a strange proceeding.

Exam. ROGERS. Yes; but I want to know what the result is by this method of computation.

A. I think under your assumption Mr. Newell's figures, from the standpoint of what we are now discussing, are only in error $180,749.00 the first year and $262,130.00 in the fifth year, (3543) from the standpoint that the examiner was discussing, namely, that the Union Pacific would haul the loads and we would haul the empties.

Exam. ROGERS. Well, under that theory, what would be the net saving after you subtract these amounts?

A. Well, Mr. Examiner, I didn't take the time to follow this all through, all these computations. I, just for short-cut purposes, took it off of the end. Page 142, Table XXII, at the bottom of the page—Mr. Newell shows that the return on the cross-State line the first year is $443,549.00. That includes handling these empty cars, and it is, therefore, in error to the extent of $180,749.00, which should be deducted from the $443,549.00. (3544.) That reduces it to some two hundred sixty thousand dollars the first year, and then the fifth year we should deduct $262,130.00, which will leave the return $573,000.00. The figure increases in the fifth year, because there are more cars handled, under Mr. Newell's set-up.

That is the saving of the cross-State line compared with the Alturas route, on the loaded movement, under Mr. Newell's process and under your premise of how we took it.

Exam. ROGERS. Well, what is wrong with that premise?

A. Requiring the Southern Pacific to long-haul empties and give the traffic to the Union Pacific.

Exam. ROGERS. Well, you can see what I am after. (3545).

1956 Mr. BURCKHALTER. I want to know whether, if the commission decides that you are right about the empties, that it can just forget about Mr. Newell's study, as you see it, or whether if it decides you are right about that, the empty haul, whether the commission would still have some consideration to be given to Mr. Newell's study?

A. Well, it seems to me that Mr. Newell's study isn't sound at all, for the reason that he hasn't provided empty cars with which to take away these loads. In the first place, he proposes in Table XXI to take 17,284 loads over the cross-State line east and only 788 west, so he has got to get 16,496 cars from somewhere else; and in the fifth year that 16,496 cars grows to 23,883, in his Table XIX, page 136.

Now, your premise is, from your last few questions, that the Southern Pacific, which now furnishes those cars from California, will continue to do so, as I understand it.

And I wish to suggest to you that that would be a very unusual proceeding, and it would involve the Southern Pacific in greatly increased empty car haul costs, above what it would enjoy under the ordinary rules of interchange. In other words, take a car at Los Angeles, for instance, why should we haul it clear up to Crescent Lake, when we can turn it back to El Paso, for example?

Comr. MCMANAY. The distances would be about the same either way? (3546.)

A. The distance is a little greater. From Crescent Lake on we would have some haul with the car. Of course, that is why I make it Crescent Lake. You have got the further condition there, and that is that through the years we might not have these cars. Now, if the time ever comes when we haven't got those cars—sup-

1957 pose that time had come in 1926, then instead of our delivering the Union Pacific in excess of 14,000 cars at Ogden they would have had to have evened up that interchange and brought enough empties out to enable us to get cars to bring into Oregon. That condition may come some time.

I don't know where they would bring these cars from. I think they would have to bring them from the far east. In principle they would have to bring them from about where the cars unload, except as influenced by local loading that they could put into those cars on the way back. In other words, if you ship a carload of lumber from Oregon to Chicago, you have got to haul that empty back to Oregon, because the preponderating direction is east out of Oregon, except to the extent that you can load that empty on the way from Chicago to Oregon with merchandise or what not on the way, loading it back as (3547) far back as you can find loading for it.

Exam. ROGERS. Well, what I was wondering was this—I heard somebody say in the grain case that there were numerous criticisms of Mr. Newell's methods in arriving at some of the data that he has

included here. Of course, this proposition of empty haul wasn't involved in that case as it is here. I am wondering whether you agree with Mr. Newell in other than the methods by which he handles the empty cars, bearing in mind, of course, that error that you pointed out this morning about the decimal point being in the wrong place?

A. No; I don't think Mr. Newell's cost data is correct. I don't think his methods are sufficiently refined to give a very close conclusion. I think his costs are very decidedly high.

Now, I base that conclusion on the work of one of our engineers who does this sort of work all the time; he has had long experience in calculating costs, and has perfected his methods to such an
1958 extent that he goes into a great deal more refinement than Mr. Newell attempts. That engineer is here, and he will tell you, as he told me, and tell you why from a brief examination of Mr. Newell's report, he concludes the cost figures to be very much too high.

Exam. ROGERS. Well, I am getting the cart before the horse. I thought that you were the only one we were going to have on this case. (3548.)

A. I want to say now, Mr. Examiner, that I don't profess to follow the engineering details through a report like this, because I haven't time to do such things any more, but naturally we have men on our staff to do those things.

Q. (By Mr. MCCULLOCH.) Mr. Burckhalter, I understood you to say that central Oregon is not a territory that the Southern Pacific should be required to serve, for the reason that traffic wasn't there to justify construction. That is about right, wasn't it?

A. Well, that was a part of my answer. It isn't all of it.

Q. Now, do not considerations of economy and efficiency also justify construction of extensions by railroads at times?

A. Yes; they do.

There have been instances of reconstruction, relocation of lines, justified solely from considerations of economy and efficiency that the Southern Pacific itself has made. The Great Salt Lake cut-off was a very fine example of that. (3549.) The line was relocated between Black Butte and Grass Lake—a section of about 25 miles. That was a line change for operating economy and better service, and was not for the purpose of originating any new tonnage.

Q. Turn to page 110 of Mr. Newell's exhibit, Mr. Burckhalter. He has shown there, has he not, in that middle column, under the heading "Road haul to or from Granger," the cost of hauling empty cars from Granger to Klamath Falls, first via Roseville, then
1959 via Alturas, then via Crane, in the aggregate, (3550) giving the references to the pages where the items of his cost are shown in detail?

A. Yes.

Q. Well, you don't contend that in this study Mr. Newell has disregarded the cost of empty car movement, do you?

A. Why, I claim that he has credited the cross-State line with savings in empty car movement, which figures per car I take right off of this same page—it is $17.43—and it appears opposite Douglas County and opposite other counties as saving of an empty haul over the cross-State line as compared with the Alturas line. Now, he applies that saving against all of the empties that he needs to balance the interchange in Table XII; he applies that or corresponding savings as he figures them to be, against 24,766 empties.

Q. Well, now, what is your criticism, for example? That as to the 4,480 empty cars westbound to load lumber in Klamath County he has used estimates of cars that are too high?

A. I think his costs are generally too high. Now, in his later studies he discards the Klamath County traffic. In his Tables XXI and XIX he doesn't figure on hauling the Klamath County traffic over the cross-State line. Now, my other criticism of that figure is that those cars didn't move empty from Ogden to Klamath County. (3551.) My claim is that they moved empty either from southern California or from central California.

Q. Have you made any computations of the cost of moving an empty car from Los Angeles or from San Francisco to Klamath Falls or Eugene, or any western Oregon point, to set over against Mr. Newell's estimates of costs via these different routes from Ogden to Eugene or Klamath Falls?

A. No; I haven't.

Q. Then your judgment that his costs are too high is based on no estimates of your own that you have made, but simply on your judgment or opinion?

1960 A. My opinion that his estimates are too high is based on the higher result he gets on savings on loads moving over the Alturas line compared with the savings that our very careful studies showed in connection with our preparation for hearing before this commission on the Alturas and the Klamath Basin cases, which I have previously referred to, and which I think you understand without my repeating. That gave me the first clue on it. Then I talked to our expert in the matter, Mr. Day, and discussed the percentages that Mr. Newell uses in dividing his costs as between direct and indirect, and after discussing the matter with Mr. Day I feel his costs are very considerably too high. Mr. Day, however, will explain that in more detail, being an expert in that line of business (3552) although he hasn't had time, if you please, to spend more than a few days on this particular report. To apply Mr. Day's method to what Mr. Newell has attempted to do I daresay will take three or four months to work this out. I would feel quite happy if he got it worked out in four months, working continuously.

Exam. ROGERS. Mr. Newell said he worked on it for two years.

A. Well, then, Mr. Day can do a lot more work than Mr. Newell can in four months. Mr. Day can apply his very much more refined methods to this problem and work it out in, I think, about four months. He can speak for himself, but he does a lot of work

for me and I watch him pretty closely and that is what I believe he can do.

This criticism does not go in any way to the savings Mr. Newell has estimated on loaded car movement.

I didn't make any deduction for his loaded car movements. I have only made the general statement that I think his costs are too high, and if so, his savings are too high. I am just dealing with the empty car proposition, and leaving the other to Mr. Day. (3553.)

1961 Mr. ELLIS. I have just a few questions that are not clear in my mind. I have very distinct recollections of the Union Pacific representatives taking just as positive a stand that Mr. Newell's figures of cost of haul were decided low, and I am wondering if you know of any conditions or factors which would cause your operating costs on the Southern Pacific to be substantially different than those on the Union Pacific?

A. Why, in our method of studying these problems we find that every freight district is different from any other freight district that we study, we find that every division is different from every other division on our own railroad, and our methods call for an analysis of each freight district and——

Exam. ROGERS. Mr. Burckhalter wasn't here when Mr. Newell testified, but didn't Mr. Newell say that the figure that would be applicable to the Southern Pacific would be too high for the Union Pacific? I thought that is what he told me about the three-mill rate that I asked hi mto apply, that it would be too low for the Southern Pacific and too high for the Union Pacific.

Mr. ELLIS. He was applying that on the cross-State haul, where the Southern Pacific had the uphill haul to Crescent Lake and the Union Pacific the downhill haul across the State. (3554.) I was asking it for a more general answer as to the conditions on the two systems.

Exam. ROGERS. On the system as a whole?

Mr. ELLIS. Yes.

A. Well, don't know what they are.

Q. (By Mr. ELLIS.) With reference to the saving in time on fruit across the cross-State line compared with the present Roseville route, I am unable to quite understand your figures. I note you claim there will be no more saving than 12 hours under the Roseville route on the cross-State route, although I understand your testimony

1962 to be that the average speed of the fruit trains is 13 miles per hour, and although the record shows a saving in distance of more than 400 miles, via the cross-State line. I am speaking of the fruit or perishables from Roseburg.

A. Well, the record doesn't show any such saving in miles, I think. I think you are mistaken about that.

Q. Well, do you have in mind what the saving would be from Roseburg?

A. In miles? Well, my figures make it 215, I think it is.

Q. Well, would it be correct to apply the rate of 13 miles per hour to that 213 saving?

A. My figure is 219 as the saving of the cross-State line over the Alturas line for a haul through Granger from Crescent (3555) Lake. The reason that that difference in miles doesn't figure out the same difference in time is that the main line schedule after the business gets to the Southern Pacific-Union Pacific route through Ogden is a little bit faster, according to my computation, which I believe is correct, than the schedule from Ontario to Chicago.

Q. Then you have made no difference in the speed of the train from the point of origin to the point where it reached the main line at Ontario or on your fruit block?

A. I used 12 miles an hour from Crescent Lake to Fernley, on the one end, and Ontario on the other, then I took the prorate of the through schedule from Fernley to Chicago on the Union Pacific-Southern Pacific basis, the Roseville fruit schedule, and a prorate Ontario to Chicago on the Union Pacific Rieth schedule on perishables. I believe my figures are correct. I wouldn't swear to them, though, because I didn't recheck them. It is all beside the point, however, because when this business gets to Crescent Lake, one railroad can't give it any faster run than the other from there; they both give it the same run.

1963 Q. Well, on the business from Eugene there would be a much greater saving of time than you have shown, would there not, via the cross-State line? (3556.)

A. I don't think so. The Roseburg fruit would move out through Eugene and Crescent Lake, and the saving, if any, would be the same as to all traffic that went through Crescent Lake, whether it went from Roseburg or from Eugene, because they all base on Crescent Lake time. The time is common from any western Oregon point to Crescent Lake; on business that moves through Crescent Lake the time is common to Crescent Lake.

The figures I was giving a few minutes ago were of saving as between the cross-State route and the Alturas route, based on 12 miles an hour from Crescent Lake to Ontario, on the one hand, and Crescent Lake to Fernley on the other hand, then coupling up with the existing through schedules. I allowed for a connection two hours at Ontario and two hours at Fernley. I didn't charge any delay at Crescent. (3557.)

Mr. ELLIS. Well, you have a difference there of only 7 hours in time, and more than 210 miles in distance. As I figure it, it would take at least a speed of 30 miles an hour on your fruit block to make your figures check out and you say they travel only 13.

A. I said that the Rieth-Chicago schedule, as I figure it, is 13.6 miles per hour, and the Roseville-Chicago schedule is 14 miles an hour.

Q. Well, if you cut that saving down to 7 hours, as you have shown it via the cross-State line under the Alturas line, would not the cross-State line have to operate at 30 miles an hour?

Mr. DEY. You mean the cross-State line, now, or the Alturas line?
Mr. ELLIS. The cross-State line, as against your 13 miles an hour on the Alturas line.

1964 A. Well, I am not running 13 miles an hour on the Alturas line.

Q. At 12 miles an hour?

A. In my example I run 12 miles an hour on the crossline and on the Alturas line to the junction with the main lines, respectively, at Ontario and Fernley, whereupon I picked up the pro rata of the existing through schedules Rieth to Chicago on the one hand, and Roseville to Chicago, on the other hand. (3558.) The Rieth to Chicago schedule, as I am informed, is 151 hours, and it is 2,050 miles, which I figured was 13.6 miles per hour. The Roseville schedule is 154 hours, and the mileage is 2,148, and that figures out 14 miles an hour.

Now, the greater distance from Crescent Lake to Fernley at the same speed manifestly loses some time compared with the run to Ontario, in elapsed time, but you make it up after you get on the main line because your schedule is somewhat faster.

Q. Well, would there be any saving in cost of ice to the shippers or to the carriers by reason of the shorter route via the cross-State line?

A. I don't think so, but I don't know anything about those ice charges. They are tariff charges.

Q. I am wondering if the substance of your testimony, Mr. Burckhalter, on this time in transit from western Oregon to the eastern markets is not substantially this—that so long as Oregon is to be given branch line service the Oregon producer of perishables is going to get into the eastern markets just a little bit behind the California producers, no matter what he does and no matter how short a route is made available to him?

A. Well, I don't think that is at all true. In the first place, Oregon is not getting branch line (3559) service. In the next place,

1965 the man who is farthest from Roseville, whether he is in California or Oregon, will not get as quick a run as the man that is closer to Roseville. That is true in California. A schedule is from what we call the assembling point, which for our railroad and for the Overland route in which the Union Pacific and the Northwestern participate, the assembly point is Roseville. Now you get 154 hours from Roseville to Chicago. What you get from your point of loading to Roseville depends altogether on your distance to Roseville and your volume with which your traffic moves. If you are out on a little bit of a branch line in California quite a ways from Roseville your business won't get a very fast move, comparatively speaking, to Roseville; but if your business is loaded from Fresno, for instance, where there is a tremendous concentration of traffic at certain times of the year and it is made up in a through train, it moves right up to Roseville in a hurry.

Q. Well, that is about the point I am getting at, Mr. Burckhalter, but isn't your statement substantially this, that even though a first-class line is built through central Oregon directly into the Willamette Valley, into the producing territories where perishables are available, they will continue to have slower time to Chicago than the California producers have?

A. Their time will be slower in the ratio that they are (3560) farther from Rieth, or the equivalent of Roseville. Now, the assembly point on the north here on the Oregon-Washington Railroad & Navigation Company is Rieth, as I understand it. I am not very familiar with that situation, but that is what I am told. Now, in central California the assembling point on the Southern Pacific-Union Pacific is Roseville; on the Western Pacific-Union Pacific route, or the Rio Grande, it is Sacramento; on the Santa Fe's line they make Bakersfield their assembling point in the upper end of the San
1966 Joaquin Valley. In southern California, south of the Tehachapi, Colton is the assembling point for the Union Pacific, Santa Fe, and Southern Pacific. Now, the schedules are all based out of the assembling point, and you will get the schedule time from the assembling point plus whatever time it takes you to get to the assembling point. Now, if you ship or load far from the assembling point, your time is going to be greater than if you ship from a point close to the assembling point, and as to southern Oregon it is far removed, relatively speaking, from both Roseville and Rieth, and naturally the schedule is longer. I understand, although I cannot qualify on rates, that they get the same rate notwithstanding that great long distance. They are on a rate parity. Their service cannot be quite the same with that great added distance; and it is further my understanding that there is no great urge for rushing these Rogue River Valley pears or apples east, but they get (3561) along very nicely as it is, and so far as my knowledge goes the shippers are very, very well satisfied with the service we are giving them. I don't know that the shorter time, if they had Roseville time, whether it would put another cent in their pocket. I don't think it would. (3562.)

I can't account for the fact that the producers of broccoli are routing a substantial part, the larger part of their broccoli shipments, away grom Roseville and through the Portland gateway, because I didn't investigate it. If the perishable traffic exists in western Oregon and there is a direct main line route east built on the standard basis, that traffic won't move just as fast from Oregon if it originates further from the assembling point than it does in California.

Assuming Eugene to be the assembling point for Oregon, as Roseville is the assembling point for California, with a schedule of 151 hours out of Rieff, I don't know what the schedule would be out of Eugene. It would be a comparable schedule; I haven't
1967 figured it, but it would manifestly be a good deal more than 151 hours, and it would manifestly be a good deal more than 154 hours to be comparable. (3563.)

Q. In suggesting the desirability of the route through Alturas, had you given any consideration to the fact that the proposal for the cross-State line was a standard main line construction, with a maximum grade of $\frac{5}{10}$ths of 1 per cent, as against a much lighter line with less ballast and with more severe grades on your Alturas line?

A. The grades are more severe on the Alturas line. As to the grade rate, I don't know how the rise and fall compares.

Part of the Alturas line is proposed to be 75 pounds on the Klamath Falls end. That rail, however, is nearly perfect. We will give you a good fast ride on that 75-pound rail. Whenever it is not fast enough we will put some 90 in. (3564.) The weight of the rail has little to do with the speed, providing the rail is in good condition and you don't run too heavy an engine over it. We took that 75-pound rail out of our line between Klamath Falls and Black Butte, and it is in perfect condition, and we took it out because we are running pretty heavy power now over the Natron line since we opened it up all the way through. We are running the 4,300 class passenger engines with 60,000 pound axle loads, and we don't like a 75-pound rail for that heavy a wheel, so we lifted it out because of its weight, not its condition. We don't expect to run that heavy power on the Alturas line.

When we were running considerably lighter power and had much lighter rails, we made about as much time as we do now. I think some of the runs in the early history of our railroad, when we had 50-pound rail and little teapot engines, as we now call them, were about as fast as anything we run to-day, when they wanted to go. In other words, the track was smooth and the power was light and it could move fast over a light rail.

1968 On our Alturas line, from Fernley to Klamath, generally, (3565) I think we would use our Consolidation type of locomotive, which we call C–9, which is about 183,000 on four drivers. I think that would be the ordinary type of engine. Then we have an engine that is a little bit heavier than that, of the Mikado type, that weighs about 210,000 on drivers. We would not put a Pacific, heavy mountain type, or a Santa Fe, or a Mallet. I think we will get along with light Mikados or Consolidations, to start with.

The amount of ballast, and the grades and curves and weight of rail are all important factors. The rail is a factor as to its condition; and the amount or the quality of ballast depends on the climatic conditions. As to the curvature, curvature always restricts speed, more or less, depending on the degree of curvature. It is pretty hard to make anything more than a general answer, I think, in that regard. (3566.)

We have had an ample supply of empty cars available on our lines in California to take care of the loading from Oregon east through the Oregon gateway. We had an ample supply in 1926, the year covered by Mr. Newell's study as to the traffic originating; we have had since, and I think we will continue to have, unless there should

be some radical change in transportation that would change the interchanges and change the situation around. As to the more southern gateways we are bringing more loaded house cars west than we are shipping east, as explained this morning, and that tends to make empty cars in California. Yes; I stated that the cars were available in California for this eastbound loading and did not need to be hauled west through Ogden, as Mr. Newell had hauled them.

Q. I have before me your testimony in Docket 14392, page 851, on which I find this statement: "It should be borne in mind in considering car shortage in Oregon that Oregon is very remote from the center of consumption and that it is the hardest country in
1969 America to get empties into." I am (3567) wondering if there is anything inconsistent with your testimony now when compared with that statement.

A. Well, I don't think so. That was rather a brief statement that apparently was not then understood. I would like to explain what I meant.

The distance across this continent is substantially the same, when taken from an eastern city like Chicago to Los Angeles or from Chicago to San Francisco, or Chicago to Portland, or Chicago to Seattle. Those distances, which are great, are substantially equal, and they fan out like my fingers. Now the cars come west over those routes, and whenever you have to get in on the lines connecting those primary routes you are getting further away from Chicago all the time.

Now it happens that between Roseville and Portland is the longest connecting north and south piece of track between the parallel east and west lines, and when you get up in the middle of that territory, half way between Roseville and Portland, you are further from Chicago by rail than you can get anywhere in the United States. You are further from New York. And when branches come off of that line, they are still further away. And that is what I had in mind in saying that it was the hardest place to get empties to, for the simple reason that it is the furthest territory from the center of consumption, and it is the furthest distance that empties have to go when brought west here to make up a (3568) deficiency in interchange to move this large volume of lumber east.

Any line that cuts across into this territory I have been describing and which I referred to in my testimony in the former case, like the cross-State line, on the one hand, and the Alturas line, on the other, will shorten the empty haul of cars that move from
1970 Granger, say, into that territory. It won't shorten the haul on empties for that territory that don't move that way, though.

Exam. ROGERS. Based on your testimony, before the cross-State line would serve this purpose in getting empties into Oregon, would you have to move those empties from some point west of Granger, or east of Granger, simply for the purpose of getting them into Oregon?

A. Yes. The cross-State line would not shorten the haul on empty cars to Oregon unless they came that way, and they would not shorten the haul of empty cars to Oregon, to Crescent (3569) Lake, more than about 200 miles over what the Alturas line would do if they come that way. Either line will very much shorten the present length of haul to, say, a point like Roseburg, if the empties were hauled from Ogden or Portland.

The situation is not that so long as there is an adequate supply of empty cars at hand in California, a short distance off, there won't be an empty car supply hauled from the east. The cars had better come from California to Oregon for loading than go east, rather than go back empty from California and then bring other empties out from the East to Oregon.

Assuming that there was an empty car supply at Portland, it would not be our policy to move them from Los Angeles or El Paso—not if Portland ran into surplus box cars; we would not haul them up from California. If empties were available at Ogden, we would haul them from Los Angeles or central California whenever we could economize in empty mileage. The distance, I figure, from Los Angeles to Crescent Lake is substantially the same as from Ogden to Crescent Lake via (3570) Alturas—about 881 miles from Los Angeles and 888 miles from Ogden, and the distance would be a standoff. El Paso is 814 miles from Los Angeles.

Q. Now at the time your company started the construction of the Modoc Northern the proposal and the proceeding for the construction of the cross-State line had been inaugurated and you were fully aware of the demands of the State of Oregon for
1971 a cross-State line, were you not?

A. I know that the matter had been before the Interstate Commerce Commission in a hearing, that the Oregon commission had sponsored such a line. (3571.)

H. D. MORTENSON was thereupon produced as a witness by defendants, and, having been duly sworn, testified as follows:

I reside in Klamath Falls. I appear here on behalf of the Klamath Falls Chamber of Commerce and other interests of the Klamath Basin. I am president of the Pelican Bay Lumber Company (3572), who are engaged in the manufacture of lumber and box shooks, and refined lumber manufacturing, to a certain extent. Its plant is located on the Upper Klamath Lake, about two miles north of Klamath Falls, Oregon. The capacity of the mill is around 90,000,000 a year; we expect the actual output this year to be 80,000,000. I think the cut of this mill is as large as other mills in the Klamath Basin. There are about 25 mills in that section, whose combined capacity is about 533,000,000 feet annually. They are all pine mills. A new mill coming in will add to the above capacity. These 533,000,000 feet are distributed 60 per cent into California and about 40 per cent (3573) goes east. Of that 40 per cent about 12 per cent goes north of Chicago, about 88 per cent goes either

east of Chicago or south of Chicago. Our mills are served by the Great Northern and the Southern Pacific.

I am familiar with the proposed cross-State line, and in offering testimony here I can speak not only for myself but the other
1972 pine manufacturers in my district with respect to transportation facilities. I have discussed this matter with them and I am confident that I know their general opinion. I did not ask for written authority to speak for them, but I told them I was coming here and told them for what purpose, and it was quite agreeable to them that I should do so. I talked with six or seven of the larger ones.

From the standpoint of marketing our manufactured product, the construction of the cross-State line is of no interest to me, because I don't feel any need of it at this time. We are well served by the lines that are there, and we don't see (3574) that there would be any advantage to us in the operation of our business to have any other facilities than those that have been provided and that are now under construction.

I have very much interest in the Alturas construction, which is being constructed by the Southern Pacific Company, the chief carrier serving our district.

Assuming the Alturas line completed, and assuming the cross-State line completed, our shipments going east would go over the Alturas line; but the small proportion that we send north goes over the Great Northern. There is a little movement that way.

The cross-State line would not open up to us and the other mills in our district any territories which are not open to us now or which will not be open to us when the Alturas line is finished. (3575.)

We route our own shipments. Occasionally we have requests to route shipments on the part of the customer. But on all of our sales we reserve the right to route the shipments. We, however, vary that. If there is no valid reason for us not to follow a customer's request, we sometimes follow his request.

Assuming that the distance from Klamath Falls by way of Alturas, and from Klamath Falls by way of Crane and Ontario
1973 is substantially the same, there would be no incentive on our part to divide the business between those two lines between the cross-State line and the Alturas line. I don't think it would be to the advantage of the business, as far as that is concerned.

I think that the carrier that actually serves the mill (3576) always gets the long haul.

Whether they get it or not makes a difference to us to this extent: That if the railroad is in daily contact with us, and their service is the same as another road that is foreign to us and with whom we are not well acquainted, why, naturally, there being no preference, we would rather do business with the people that we come in actual contact with.

In the shipment of lumber the element of time in transit is important if it is a matter of a long time, but a matter of a few days

is relatively unimportant. We hardly ever have the question of the saving in the shipments by the customer. We do often have requests, in certain seasons, for the lumber to be shipped quickly, and often we turn down orders that we cannot ship within certain days, but that is a matter of business arrangements. That is a matter of the facility of a manufacturer to make shipments. They may call for items that are out of stock, or something of that kind. But so far as the transportation is concerned (3577) we have no difficulty with respect to the time involved in transit. And our lumber orders almost on the whole do not require a matter of a very few days. We are always given leeway in promising shipments.

The time given for delivery of lumber depends upon the character of the lumber being shipped. Now we have a number of customers who rework our lumber, and we have standing orders with those people, and we make them shipments on specified times, whatever suits their convenience. To some of them we ship two cars a
1974 week, or one car a day, and so on. That is one class of customers. So long as we keep the flow of lumber reaching them so many days apart, that satisfies the situation. Then we have another class of customers, who are the retail yard men, and in placing their orders they generally want the goods shipped within 30 to 60 days. Sometimes they ask for 3 weeks. In times of stress some of them ask for quick shipment.

We do our own logging. (3578.) I both own timber and have it contracted in the Klamath Basin, that is, with the Forest Service and the Indian Service. Our log haul to the mill is about 40 miles over the Southern Pacific, and about 37 miles over our own railroad; about 77 miles or 78 miles. There are longer hauls than this being conducted in our district. I think the Shaw-Bertram Company haul probably 15 miles farther than we do.

I think there is a growing tendency in the lumber industry—at least there is in the Klamath district—to try and centralize the lumber industry at or near the city of Klamath Falls. It has numerous advantages, largely, I might say, three: One is that labor is better satisfied in a community center; it has better opportunities for enjoyment and better opportunities for their children and wives and families. I think you get a better class of labor nearer a fairly decent sized city.

And then all the sawmills, having offal, which science is now permitting us to use, and, by congregating mills in one community it makes it more profitable to work up the by-products. (3579.)

And thirdly, as far as the Klamath Falls is concerned, it has physical advantages that are better than the old type of mill located in the woods. We have large lakes there, water storage, good climate, and pretty cheap water power.

So those three are the major reasons for centralizing the business in Klamath Falls. In doing that, they are hauling the logs for
1975 greater distances, probably will reach out from 100 to 150

miles. I know of instances in Wisconsin where they are hauling logs 250 miles.

I think 40 or 50 per cent of the Klamath Basin timber is in Federal ownership. They operate on a selective cutting basis and leave the forests in protected condition, as far as fire is concerned, burn up all the brush and make it safe for the oncoming crop. And in logging they use appliances which do the least damage to the young growth. They don't permit the use of donkey engines and several other methods of logging which would be ruinous, or, at least, more damaging to the young crop than the big-wheel logging. This system of handling the forests with respect to furnishing a continuing traffic as distinguished from a flood of traffic that would come if it were depleted at once, very much prolongs the life of the forest, and there is less taken off to the acre. I know in some instances they leave from 5,000 to 7,000 and sometimes even 8,000 feet of timber that if it were in private hands would be taken off. So that it holds back part of the yield at this time and tends to perpetuate the yield. And I think that lumbermen, particularly down in that country and in the redwoods, and other sections, are falling in with that tendency of reproduction on their own part.

I am familiar with the timber belt between Bend and Klamath Falls that extends for some miles west of the Natron cut-off or Cascade line in the direction of the Fort Rock country, where the long belt is there between that line, between Klamath Falls and Bend, after you leave the main line at Chemult. They are logging into that timber from Bend (3581) and also from Klamath Falls.

Q. Just approximately what distance is there in the gap between the two encroachments?

A. Now do you mean as to actual operation, or timber
1976 holdings? There are two large companies up at Bend whose timber holdings come very far south, and that ultimately will be operated in Bend.

Q. How near that property line have they approached from Klamath Falls?

A. Well, they are within—at one point of their holdings they are within about 10 miles, but the body of their timber I would say is probably separated maybe 30.

Q. Would you say that ultimately that timber belt will be hauled either into the Klamath mills or the Bend mills?

A. I think it will go either one way or the other; yes, sir. Probably both ways. It is going both ways now.

We have been urging the construction of the Alturas line for years.

I haven't heard of any sentiment in our community, speaking from the public standpoint, for the construction of this cross-State line. (3582.) I think the general attitude is the construction of that just at this time is perhaps premature.

Cross-examination:

My residence is at Klamath Falls, and I also maintain a residence at San Francisco. For the purpose of voting my legal residence is Klamath Falls; but I reside part of the time in San Francisco.

I have not looked into the extent of our use of the new line of the Great Northern into Klamath Falls for our lumber shipments. I leave those things pretty largely to our sales manager. But I don't think there is very extensive movement over that line.

I don't think we have developed any markets at all along the Northern line since the Great Northern entered Klamath Falls. (3583.)

1977 I don't know what percentage of our total shipments actually move over the Great Northern as compared with the Southern Pacific, except that I know they are very small.

I appeared in one of the previous hearings in the Klamath Basin cases, where the Northern lines were applying for permission to extend their lines into Klamath Falls, and at that time was a witness for the Southern Pacific in opposition to the petition of the Northern lines. I still fail to see any advantage in this proposed line at the present time, when we have not yet even completed a similar line going east, the Alturas line. I believe that that will perform all the facilities that we need until time demonstrates that I am in error. I am interested in the Alturas line. (3584.) What I am interested in is a connection which will give us better freight rates, and I believe that the completion of this line will give us better freight rates and cheaper movement of lumber east. I believe that when this railroad matter is all settled they will have to give us the Bend rate; that is, be on a parity with Bend, Oregon.

Q. Then the only advantage that you conceive from the standpoint of the Klamath Falls lumbermen is that you may get a lower rate to the East on your lumber?

A. It will not improve our facilities of handling, as far as time is concerned, to any appreciable amount, which is not as much of an interest to us as a matter of rates.

If the construction of the Alturas line does not result in reducing our rates, there will be no particular benefit to the lumber business, because we already have the north and south line to carry our lumber. But I do believe that it will be of immense interest or benefit to the farmers and general community in moving their stuff. (3585.)

1978 The Alturas line has been contemplated for some time, and, as I understand, was held up on account of the death of Mr. Harriman and the unmerging of the Central Pacific and the Union Pacific, and so forth. But we have been actually urging the construction of it ever since those matters were settled. I am not positive as to whether it has been contemplated any longer than the cross-State line from Crane to Crescent. The first time that I heard of this railroad is when I came into that country in 1910.

We have been shipping lumber into the markets of the Middle West since 1912; that is 16 years. Our trade there has been constantly growing, but we have been (3586) in those markets for 16 years. In our particular mill, I think the percentage of shipments is a little heavier east than the general percentage of shipments from the Klamath district, because we refine our lumber a little more and we go after the eastern business a little more. So I would say 50 per cent of our lumber goes east, and probably 50 per cent goes to California.

Q. Well, what shipments, or what companies were you referring to when you said 60 per cent goes into California and 40 per cent east?

A. I was speaking of the region in general. There are some concerns there that ship 75 to 80 per cent of their lumber east. I speak of those concerns who manufacture largely boxes, food containers.

Mr. DEY. You mean California?

A. California, yes.

The Klamath manufacturers ship a greater percentage of their output to California markets than the western Oregon lumbermen do. (3587.) The western Oregon lumbermen are closer to the Middle West and East, and they have built up their trade and business probably along that line. The western Oregon lumbermen manufacture quite a number of boxes, but I don't think to the same extent that the pine of the Klamath district is used. I think they put out more in common boards in proportion to shook than the Klamath Falls mills do.

The lumber yards and brokers in the East in recent years carry smaller stocks on hand and depend to a greater extent on
1979 prompt delivery. They don't carry as much lumber as they used to carry, and they order lumber from the mill, which, perhaps, unfortunately requires the manufacturer to invest considerably more in lumber on hand in order to take care of his trade (3588) and also in dry kilning facilities, so that he may prepare that lumber for the trade. But we overcome that somewhat in an analysis of our product, so that over a period of years, or months, rather, we can figure about the percentage of different grades we are going to get from our logs, and, therefore, can more or less shape our sales to fit what we know we are going to produce and have ready at a given time.

Q. To the extent that you say the practice has changed in the buying of lumber, then, the matter of time in transit is more important now than it was a few years ago?

A. Well, if it is, it is a question pretty largely of management, that sort of thing. If a person is going to wait until he wants lumber and then order it, why, that is one matter, but if he is going to manage his business and order with reasonable dispatch, why, it does not affect the proposition.

Q. But you would expect to get some benefit from the saving in distance via the Alturas line in connection with shipments demanding prompt delivery?

A. I don't think that difference would make any difference at all in the case of lumber. (3589.)

Q. (By Mr. McCULLOCH.) Mr. Mortenson, do you know about how long it takes your lumber, on the average, to get to Chicago from Klamath Falls?

A. Only generally. I have heard that under present movements it is 13 to 15 days. I am not prepared to answer how long it takes to get to New York. I don't follow the details that closely.

The Klamath people urged the construction of the Alturas
1980 line because it opened up quite a country; it was a direct route East; it would haul some of their livestock East; it opened up the Merrill Valley and quite a large section of country there, and made Klamath Falls a diverting point for traffic, passenger traffic, and one thing and another, going East. It was decidedly in pretty near every particular to their advantage. (3590.)

I understood when you spoke of the Klamath people you were referring to others than the lumbermen of the Klamath section. The lumbermen are chiefly interested in the building of the Klamath Falls line as a means of getting reduced freight rates to the East. And the other people are interested in the quicker route, better outlets to markets, and general development they thought would take place in the territory traversed by the Alturas line if it were built. They were generally interested in having the country opened up and a new railroad with a direct connection east, and a diversion of passenger traffic through the town.

I think the rank and file of the people in Klamath County were probably glad to have the Great Northern built, just because they wanted another railroad. (3591.)

Our mill has access to the Great Northern so that we can ship over it if we wish. We have shipped over it some. The Great Northern is certainly not a detriment, but I could ship my lumber just as well over the Southern Pacific. As a lumberman, everything else being equal, I would prefer to be located at a point where our mill would have the service of two railroads rather than one to eastern markets. (3592.)

If a cross-State line were built, to route our shipments east over that line, I don't think it would make any difference whatsoever to the lumbermen of the Klamath Basin, to have the opportunity of having one more competitive route to the East.

1981 Exam. ROGERS. Didn't you say, Mr. Witness, that you appeared in opposition to the Great Northern extension, in the Klamath Basin case?

A. Yes.

Exam. ROGERS. Have you changed your mind?

A. No, sir.

I said I had used it to a small extent, Mr. Examiner. And, furthermore, I said that, everything being equal, nothing else at stake, that I thought two railroads were probably better than one. But I still think that the development in Klamath County has been and is and will be handled satisfactorily from our point of view, with the completion of the Natron cut-off and the Alturas line.

Mr. DEY. You say you appeared in opposition to the Great Northern entry; you appeared at the same time in support of the Alturas line, did you not? (3593.)

A. Yes. That was all tied in together.

Mr. DEY. And in support of the acquisition of the N. C. O. and the O. C. & E., all of which dockets were heard together?

A. Yes. They had a rail movement on there that was called the Main Line East Association. That was to express the desire of the people of Klamath for this Alturas line, and I believe that that association was joined by some 400 farmers and people down there to express their views as to the desirability of the Alturas line, and that whole question was involved in the case. (3594.)

Since the Great Northern has extended to Klamath Falls, there has been no appreciable movement of lumber or box shooks from the mills at Bend into California. There was none hitherto.

Q. Are the Bend mills in a position now to compete in California markets in shipping pine lumber and box shooks into California with the lumber mills of the Klamath Basin?

A. Well, they have a connection there. It is possible for them to ship that way. They have a higher rate from Bend to
1982 California points than they have from Klamath.

Q. On shipments to Chicago and to points east of Chicago is there any advantage in distance or time or service after the Alturas route is constructed in shipping via that route than Ogden east or in shipping via the Great Northern and through Spokane and east to Chicago and points east of Chicago? One (3595) route would be substantially as desirable as the other from Klamath Falls, wouldn't it to Chicago and points east, either the route north or the route south?

A. Well, I think that the route south reaches to more territory The route north goes up through a long haul that is unnecessary.

Q. I am talking to destinations Chicago and east. Would there be any advantage in shipping to Chicago or a point east of Chicago, to ship via Alturas rather than via Bend and the Northern route, from your standpoint as a lumberman, in time of delivery or in point of service?

A. It might be possible in point of service. We are right on the main line of the Southern Pacific, and we have better facilities there for cars and getting them out towards their destination than we have going north.

Q. What do you mean by better facilities in the matter of cars? Are you getting a better supply of cars for shipments of your lum-

ber since the Great Northern operated into Klamath Falls than you did before?

A. No; we haven't had a car shortage for some period of time in Klamath.

Q. Do you think the Great Northern's service into Klamath Falls is of any benefit to you in the matter of obtaining car supply?

A. No; I said that we had always been supplied with cars (3596) from the Southern Pacific.

from the Southern Pacific.

1983 Redirect examination:

Our mill is now served by the industry tracks of both the Southern Pacific Company and the Great Northern railroads. I know that the proposed cross-State line will, on its way to Crescent Lake, cross the Great Northern and cross the Southern Pacific tracks.

Q. In central Oregon—a connection with the Southern Pacific at Crescent Lake, and crosses the Great Northern 20 miles to the east. Would you concern yourself, in the routing of lumber from your mill, to route any of that lumber to the cross-State line off of the Great Northern if you shipped it on the Great Northern, or off of the Southern Pacific if you shipped it on the Southern Pacific?

A. No; I wouldn't. I am pretty largely interested in the delivering road, and, as I said a moment ago, the road that serves our industry, whether it be one or two, would by choice get probably the long haul. We certainly wouldn't want to send it up part way on their road 40 or 50 miles and just deliberately, with no reason, divert it to some other (3597) road.

In other words, we don't want any irritation and controversy with the local officers and agents with whom we are doing business daily, if we are served adequately. And that is the situation in my experience and observation, with respect to other industries served by trackage in our community and other communities. The local line has all the advantage.

1984 W. C. DALTON was thereupon produced as a witness by defendants, and, having been first duly sworn, testified as follows:

Direct examination:

I live in Modoc County, California, (3598) over the Oregon line. I have interests in a ranch, a half part of which is in Klamath County, Oregon, besides other interests. Practically all of the business is done there.

I am president of the American National Bank of Klamath Falls. I own around 5,000 acres in the Klamath Basin, on both sides of the State line. That includes about some 3,500 acres that is irrigated, and the other is above the irrigation system. I have range lands besides that, but they are more in California. My holdings there are about 14,000 acres. I have about 3,000 cattle; no sheep. (3599.) The ranches produce about 1,200 tons of alfalfa. I am pretty much

interested in that part of the country; I should be—I have been there long enough. I should be familiar with the farming and stock raising conditions in that county.

In that district I produce about 1,000 carloads of potatoes, and sell them wherever we can find a market for them. Over 90 per cent of them will go South. We have had some trouble finding a market for potatoes last year and this. This year we are just opening up; it don't look any too good. We could raise more of them if we had a market for them. (3600.) The potato industry there has increased 95 per cent in five years. We could easily double our production if there was a market for them.

I think about 60,000 tons of alfalfa hay is raised down in that country. We have been feeding it locally because we had no railroad transportation to wherever we could find the market.
1985 That would be in the Willamette Valley or in California.
California bought some hay in there last year, but when they were buying this hay the wet weather came on and the roads were closed and we couldn't get it to the railroad, and it is still sitting there. They raise alfalfa about 25 miles out from Klamath Falls. They raise other hays, but the alfalfa they ship. The hay up through the valley there where it is thickly settled they don't have that amount to ship that they do down south of (3601) Merrill and west of Malin. They could haul it in with the truck on the highway, but out where that hay was raised they have no highway, up in that new settled country.

Exam. ROGERS. How come you up here?

A. The Klamath County Chamber of Commerce notified me that they wanted a representative here.

Exam. ROGERS. What interest has Klamath County in this case?

A. Well, I don't know as they have got any, any more than the Klamath County Chamber of Commerce, I think, done all that they could to encourage the construction of the Modoc Northern Railroad, and I don't feel as if they have got any objections whatever to the building of a cross-State road so long as it doesn't interfere with the tonnage that the Modoc Northern is entitled to.

Comr. MCMANAMY. What do you mean, "entitled to"?

A. Well, they have been granted a permit to build the road, and it is actually under construction. I think that the freight along the line of the Modoc Northern they are entitled to.

By the Modoc Northern, I mean the line from Klamath Falls to Alturas. (3602.) I think that freight along that road they are entitled to, until you at least get your bearing. Freight originating on this Modoc Northern goes right through this Modoc country.

Exam. ROGERS. Were they afraid some of that freight was going to move up this way and over the cross-State line?

A. I don't know. I believe that—now, as I understand it,
1986 in laying a base to show that there was sufficient tonnage to warrant the construction of a cross-State road I think they name the tonnage in that basin.

Exam. ROGERS. Well, was it your understanding that the parties in this case were depending on that tonnage for the cross-State road?

A. I am not positive of that, but I think they claim that tonnage in the Klamath Basin as tonnage available for the cross-State line. That is the reason I am here.

The Klamath Basin has sold some hay in the Willamette Valley. (3603.)

Q. Could it produce more if the market were there for it?

A. Well, you see, we are under Government irrigation. They have reclaimed there a lake of 92,000 acres, which will be available for homesteads, about half of it, and the only reason that there isn't more of that land settled today is the fact that they had no transportation; the Government is afraid to throw it open and get the people in there with a lot of tonnage that they couldn't dispose of. This lake of 92,000 acres is called Tule Lake. Perhaps 50 per cent of that will be homesteaded, and this road runs right through that Tule Lake country.

With the construction of the Alturas line, according to my judgment, there should be a very large additional production of alfalfa and potatoes, which are two crops that can be raised down there satisfactorily. (3604.)

The live stock in the Klamath country consists of cattle, sheep, some hogs, and the dairy industry developing. I think there will be room for considerable expansion in dairying. The dairying interests find an outlet for their product almost entirely in Oakland, California.

1987 There isn't a great deal of beef cattle left in the country. Shipped from the Klamath country, I think there would be 500 carloads. Ninety per cent of that will go south, to San Francisco and Oakland. There are about 130,000 sheep raised in there. (3605.) They ship a great many lambs out of there, which go mostly to the San Francisco market. This industry is developing.

Q. As a matter of fact, the vast acreage that you have got under water there and that isn't occupied, running into thousands of acres, gives room for development of every one of these projects we have been talking about in very large amount, doesn't it?

A. That is the main reason we wanted this line built.

Comr. MCMANAMY. Do you understand that this proceeding has anything whatever to do with the construction of the Alturas line?

A. Well, I have been led to believe that it has.

Comr. MCMANAMY. Where did you get that information?

A. From Southern Pacific officials.

Exam. ROGERS. What did they tell you, Mr. Dalton?

A. Well, they didn't think that there would be freight sufficient to warrant the construction of both lines at the present time.

Exam. ROGERS. Who was that told you that?

A. Paul Shoup. (3606.)

Exam. ROGERS. When did he tell you that?

A. Well, I think on different occasions. Not later than last May. This line has been in contemplation—the first survey of this road, I think, was made in 1910.

I am here just to present Klamath views of the situation as we see it.

Exam. ROGERS. That is, to keep the Southern Pacific from quitting the Alturas line?

1988 A. Oh, I don't think they are going to quit it, but I say in so much as we have used all the influence we have to encourage the construction we would like to see them get the tonnage they are entitled to. Not off of anybody's line; off from the country along the lines of road they are developing.

No one told me that the Alturas line would be dropped if the cross-State line was built. I have no fear along that line. (3607.) I have been given to understand that it is the judgment of some people that there isn't any justification for both of these lines.

The lamb marke is mostly all south. Some go to Los Angeles, but most of them to San Francisco. Ocassionally some to Portland.

In that district, besides alfalfa and potatoes they raise grain—wheat. The wheat mostly comes to Portland—I think maybe 300,000 bushels, probably, exported from there last year. The wheat, I think, was mostly exported from here and was shipped to Portland. It wasn't purchased in the Willamette Valley. (3608.) I raise grain myself. Our grain we sold to the local millers there, and it was put through—I think nearly all of it was shipped to Portland. (3609.)

Q. Have the people down there generally any interest in the construction of this cross-State line, so far as their particular interests are concerned?

A. Take that particular locality, I don't think that they are particularly interested in it, but I don't think they have got any objections to the road if the commission thinks it should be built and that there is sufficient tonnage to warrant its construction.

The people don't want the Alturas line, which they consider their line, stripped in order to support some other line; I think that is the way they have got it.

1989 The mills in Klamath Falls might ship some mill feed or mixed feed to Willamette Valley points, but they make a mixed feed there. I am not familiar with that. They sell some locally.

I have never been in the sheep business down there at all. (3610.) A good many customers in my bank are in that business. This is an important enterprise in the Klamath Basin. They raise and handle or feed about 130,000 sheep in there. 90 per cent of the lambs will go to California. Only a few lambs for breeding purposes is all I know of that will go east.

Q. Now, if the county agent should come in there and tell you that they were going to ship 44 or 45 cars a year of lambs east, what would be your opinion on that?

A. They might ship them for breeding purposes. They might ship via the cross-State line every year; I don't know.

44 cars would be about 90 for single deck and 180 for double deck. (3611.) If they were shipping these cars east, and if the Alturas line and the cross-State line were both built, I guess they could ship either way. From where I am I would probably ship via Alturas, because we are south of Klamath, would be right on that line.

Q. Well, is there any local interest there so that they prefer the Alturas line to the other—that is what I am trying to develop—particularly if the other was operated by another railroad that didn't serve Klamath Falls?

A. Well, we certainly wouldn't as far as the railroads were concerned. The Southern Pacific lines are so laid out that it is developing that country, and that is the reason that we are interested in it. The agricultural land and the stock industry is south of Klamath Falls, south and east.

Q. Well, does that involve crossing the Southern Pacific tracks or facilities to get to point of shipment? They would have to ship on the Southern Pacific or the Great Northern anyway, wouldn't they?

1990 A. The only railroads in there.

Q. Yes. Well, is there any reason that you can think of that would induce the shippers there to route it via the cross-State line, over the Union Pacific Railroad, or the system, or the O.-W. R. & N. unit of it?

A. None that I know of. (3612.)

The sheep winter in the southern part of Klamath County, and in the summer in the northern part. The season is starting to ship lambs right now. In the shipping season there would be a considerable number of sheep in the upper part of Klamath County; ship from Chiloquin. They are shipping from Chiloquin now. This is south of Crescent Lake; I don't know just what the distance is, but it must be a hundred miles. The sheep graze in that vicinity; just pasture; they have wonderful summer pasture over there. The sheep range up in around Chiloquin (3613) north and east. They both drive them and ship them up there; they do both, but this last spring there was some sheep shipped from Midland to Lenz.

I don't think they have grazing-in-transit privileges to ship them up there and ship them back. They might have some special rate on those sheep shipping up there for that purpose, but I think it was a one-way shipment. I think the big part of their wool is shipped to Portland.

Cross-examination:

Q. (By Mr. ELLIS.) Would you anticipate a movement between Harney Valley and Crescent or Chiloquin similar to the one you have described from Chiloquin south into your section of the country

and back to Chiloquin of sheep? That is, for advantages of feed in the different seasons of the year? (3614.)

1991 A. There might be some.

Q. As a practical stock raising problem, it is the general practice to winter the sheep where there is hay available, and then ship them out onto the range for the summer and ship them back in again to the hay supply?

A. That is done.

Our section of Klamath County has had no large surplus of alfalfa hay available at railroad shipping stations. We have quite a lot of hay available, but it hasn't been on a railroad—25 miles away. It is impracticable to haul alfalfa hay for distances of 25 miles to get it to the railroad unless you have a highway. At times of the year you might haul it, but last year it rained down in that country in the bed of that lake and you couldn't haul out of there. The result is the hay is still sitting there. (3615.)

I think some alfalfa has been shipped into western Oregon. I am not familiar with that. But this hay that I speak of was going to Modesto, California.

The Modoc Northern as surveyed misses the home ranch about seven miles; but it would be within convenient reach of my ranch. It is my thought, undoubtedly, that that will aid in the development of my land. It will be a big factor in cutting it up and selling it off. When we were raising cattle we could drive them to market, but when you get to colonizing it is a different proposition. We can colonize this land now to some extent without the Modoc Northern; but if it takes an average of 25 cents a hundred to get your products to a railroad, it is taking the lion's share of the profit. (3616.)

I lay a great deal of the large increase of 900 per cent in the production of potatoes in Klamath County in the last five years to our county agent. We never raised a great many potatoes and didn't know what a potato country we had until we got

1992 started. Take it three or four years back, potatoes were a good price; we made a lot of money out of them. I think 90 per cent of the market will go to San Francisco, or south.

Exam. ROGERS. But I had understood that these county agents were pretty nice young boys, but they didn't know much. What do you know about it?

A. Well, ours is different. We swear by him.

Q. (By Mr. ELLIS.) Your conclusion, then, on this railroad construction matter is that your production is largely a matter of markets, and you need the railroads to reach the markets?

A. I think that is the case. (3617.)

Q. (By Mr. MCCULLOCH.) Mr. Dalton, is the livestock industry important in Klamath County?

A. Oh, yes. Livestock moves principally to San Francisco.

Q. Any of it come north to Portland and then on to Puget Sound markets?

A. Oh, they have—when they feed cattle. Now, sometimes we feed in Klamath County, and some of them feed out, until towards spring grass cattle begins to develop south, and we find a market north for it.

I think just a little over 20 miles of the Modoc Northern will lie in Oregon before it passes into California, from Klamath. The rest of the line, to Alturas, will be in Modoc County, California.

Livestock is a growing industry in Modoc County, California.

Q. Will the construction and operation of this Alturas line, in your judgment, be of substantial benefit to the livestock industry of Modoc County?

A. Why, Modoc County is served by the Southern Pacific now, and it practically covers the stock growing section, the present
1993 road, N. C. O. No doubt it will help, but they could ship this way if the—— (3618.)

If the N. C. O. were not built and this was the first time that a railroad was projected and built into Modoc County, in my judgment the building of such a line we know would stimulate and benefit the livestock industry of the county.

I think that a new railroad in any country that is devoted principally to the production of livestock, where there is no railroad and never has been a railroad before, is bound to be of substantial benefit and stimulus to the livestock industry of that territory. You must remember that we have got to have feed to run livestock. Wherever you have got feed sufficient to run, of course you need the railroad, no question about that. You can't raise cattle without feed and water. If you have feed and water sufficient to run stock, you need a railroad.

Redirect examination:

Q. (By Mr. DEY.) Well, then, a country that hasn't got feed and water, a railroad doesn't help much, does it?

A. Not a durn bit.

Q. Now, you say this railroad, the Alturas line, is going to run near your land—it doesn't run where you want it, does it? (3619.)

A. No; it is going to miss us about 8 miles, the way I would like to have seen it went.

Q. You have been doing all you could to try to get the company to build it in a different location from what it was going to build it, haven't you?

A. I never did try to build a railroad. (3620.)

[File endorsement omitted.]

1994 PORTLAND, OREGON, *August 23, 1928.*

HAL F. WIGGINS was thereupon recalled as a witness, and, having previously been duly sworn, testified as follows:

Direct examination:

I have prepared some additional exhibits summarizing the revenues and tonnages which have previously been testified to in this

case. There are three exhibits embraced therein. These are the exhibits that I have before me. With respect to what sources I compile the summaries from, which I have prepared:

The first, consisting of three pages, is the statement showing the estimated tonnage and revenues from the ten southwestern counties via proposed cross-State line, based upon the Idaho exhibits and testimony.

I have explained heretofore substantially the method of rating and computation involved in this, and assumed that it (3621) was ready to be offered as an exhibit.

I have applied the rates to the total western Idaho traffic. This is the westbound traffic based on the first and fifth year estimates as previously in the record, and I have, as in Exhibit 28, taken the tonnage from that territory, using Boise as typical of origin and San Francisco and Los Angeles as typical of California markets, and laid the current tariff rates at the mileages via the proposed cross-State line, figuring the allocation to the cross-State sec-
1995 tor in the same manner as the revenues were figured and calculated in Exhibit 28. I have abbreviated the exhibit in form for convenience, but the calculations as previously explained at the time of introducing Exhibit 28 are identical with those used in Exhibit 28. (3622.)

(Said statement was thereupon received in evidence, marked "Complainant's Exhibit 104, Witness Wiggins.")

The second exhibit is the estimated tonnage and revenues for the cross-State line by years according to traffic groups or blocks, as indicated in the subheadings underneath the group numbers.

The first is Oregon traffic created, being the totals brought forward or recapped from Exhibit 28, which was the blanket exhibit showing complete details as to how the figures were determined.

Group II represents the San Francisco and vicinity or California traffic through Oregon points east of Crane, and is based on the Newton exhibits introduced for the Idaho commission.

Group III consists of Alkali outbound.

Group IV, Alkali tonnage inbound.

Group V is inbound tonnage to cross-State line.

1996 Group VI, Idaho traffic westbound, as just indicated in Exhibit No. 104.

And Group VII, Idaho traffic eastbound. (3623.)

In Group V, which is inbound tonnage to cross-State, which is starred, I have taken as the basis Mr. Lounsbury's Exhibit 75 in I. C. C. Docket 14392, being the tonnages and revenues shown in that exhibit, except for the interpolation between years 1 and 5. The tons are identical and the mileage the same relationship as the cars to the totals shown in this exhibit.

As to my estimate in Groups III and IV relating to Alkali Lake, I have taken Mr. H. L. Emerson's testimony as the basis for the outbound tonnage, namely, 50 tons per day for the 300 working days

in the year. I took 50 tons per day because that is the minimum output estimated on the basis of the unit which Mr. Emerson said was proposed to go in there with transportation. I mean that was the minimum operation—the smallest operation that has ever been considered in connection with the plant. The unit proposed at the time of Docket 14392. As a matter of fact, his subsequent testimony indicates that it would be considerably larger—I take it, very much so. (3624.)

I took that Group V from Mr. Lounsbury's study in the previous case because it consists of a large block of detail traffic for miscellaneous tonnages, light, a most tedious compilation, and I also felt that—regarded it as a minimum to the line.

Exam. ROGERS. Well, don't we have an exhibit now that is not based on this record?

Mr. SPENCER. In a record that involved Lakeview, Klamath Falls, Burns, and Bend.

A. No; I beg your pardon——

Mr. SPENCER. Well, that was involved in that case, now, Mr. Wiggins.

1997 A. That is very true, Mr. Spencer, the entire record was, but I only took the allocations to the so-called cross-State sector, and it is so segregated.

Mr. SPENCER. Included traffic originating in those points. The petition in that case petitioned the construction from Lakeview to Bend——

A. It took traffic inbound. It is inbound only, and it is allocated to that sector.

Exam. ROGERS. My point, Mr. Wiggins, is, as it is now we cannot tell on what this is based. There is no foundation for it at all in this record.

A. Well, so far as that is concerned, I might say that in checking it over I could substitute these figures as my own minimum estimate, so far as—I would regard it as a minimum, and I have checked it over very carefully and regard it as a minimum estimate of that miscellaneous tonnage of that character that would allocate inbound to that sector of the road. It isn't mixed with any other proposal at all. It is allocated specifically.

Group VII, I might say, is based on the Newton exhibits of the Idaho commission.

Mr. DEY. VI and VII both, those groups?

A. No; sir. Group VI is based on Exhibit 104, which carries a detailed compilation.

Mr. ELLIS. I will ask that this statement entitled "Recapitulation, Estimated Tonnage and Revenues, Cross-State Traffic, Groups by years," be received and marked the next exhibit number.

Comr. MCMANAMY. It may be received and marked Exhibit 105.

(Said statement was thereupon received in evidence, marked (3626) "Complainant's Exhibit No. 105, Witness Wiggins."

1998 My next exhibit is estimated tonnage and revenues, cross-State, on basis of diverted traffic to cross-State line, that is, traffic shown in Exhibit No. 26, and rated—that being traffic moving via the Ogden gateway, against which I have laid tariff rates and distances shown in column 7, computing the total revenue as revenues as shown in column 9, and making a straight mileage prorate allocation as shown in column 11. It is summarized by traffic groups on the lower half of the second page, the designations of the particular traffic being shown in the left-hand column, column 1.

It summarizes accounts for 30,628 cars, of 916,720 tons, showing a total gross revenue of $15,568,029.85, and on basis of straight mileage prorate allocation to the proposed cross-State line allocates $1,147,081.82, on the basis of the first year.

In the case of the last entry on the second page, "Lumber, Bend to East," showing 3,410 cars, which as explained is already accounted for in the record, there is an error as to the point or calculation by which 10,230 tons is changed to read (3627) 102,300; the total ton-miles, 291,248,100 in lieu of 29,124,810; and the total revenue, $1,575,420.00 instead of $157,542.00; and the allocated revenue to the cross-State sector of 168.5 miles between cross-trunk junction and Crane is $93,264.86 instead of $9,326.49.

The totals are corrected to correspond. (3628.)

The last figure in column 11 is the earnings claimed for the cross-State line, taking the western Oregon traffic and applying a straight mileage prorate to it, and as indicated in a note on that page it represents this mileage allocation as against the 189 miles
1999 cross-State, or the 168.5 miles, as the case may be, against the rather long mileages of column 7, and is straight mileage prorate only. In other words, it isn't the revenues claimed for the cross-State road, but it is necessary to go to Exhibit No. 16 for those revenues. I think the note at the bottom of the page explains that, however, and gives reference to the proper exhibit. This statement I have just discussed covers the first year traffic, as indicated in the lower left-hand portion of the page. The heading on the first page is in error to the extent that it says, "First, second, third, fourth, and fifth years." Rather, it expresses the intention, but not the performance, as it was my purpose in the time permitting to (3629) compute the second, third, fourth, and fifth from the basis used here. I have not so computed it for the remaining years. I had it computed, but instructions for the machine work failed me, and it would be necessary to complete that if you desire. I have made it approximately, but I would want to revise the fourth year figures before submitting it as a whole. I do not have the total figures corrected at this time available on the remaining years. I can readily make the corrections and offer it in supplemental form.

Mr. ELLIS. I will ask that this statement just identified and described be received and marked Exhibit 106.

Comr. MCMANAMY. It may be received.

(Said statement was thereupon received in evidence, marked "Complainant's Exhibit No. 106, Witness Wiggins.")

I do not think I have any further explanation to make of my exhibits.

Exam. ROGERS. Mr. Wiggins, let me see if I understand this. As I get it, now, take the first year's traffic, the traffic originating and destined to the cross-State line (3630), your revenues are $65,745.00?

2000 Mr. DEY. Where is that?

A. Pardon me, if I may get that. Exhibit 104, and page——

Exam. ROGERS. Three.

A. —three.

Exam. ROGERS. No; it is on Exhibit 105.

A. Exhibit 105, and——

Exam. ROGERS. That is the Idaho traffic, isn't it?

A. Exhibit 105 embraces several different blocks of traffic, as indicated in the subheadings.

Mr. DEY. 104 is the Idaho traffic.

A. Well, 104 is Idaho westbound only. Idaho eastbound is found in Group VII of Exhibit 105.

Exam. ROGERS. I see that I am in error.

Cross-examination:

Referring to Exhibit 104, I have used Boise as a typical point of origin in the southwestern counties of Idaho. (3631.) The first item, "Commodity, grain," destined San Francisco. The rate of 56½ cents a hundred pounds, I believe that is the Boise rate to San Francisco via the existing route. I am not certain whether it is Wells or Ogden, but probably the Ogden route. Existing rates by existing mileages, I will say, even though the mileage used in column 11 is admittedly the cross-State mileage. My plan is to take that grain from Boise, for instance, destined to San Francisco, if there is any, route it over the cross-State line and turn it over to the Southern Pacific at Crescent Lake, instead of turning it over to them at Wells or Ogden. I am merely rating the tonnages which have already been supported via that route. The tonnages supported, so-called, those are taken from the Idaho exhibits and testimony.

2001 Q. Which exhibits?

A. Well, I will have to——

Q. Newton, or Madden, or——

A. No, their agricultural estimates. I believe that Mr. Madden's (3632) exhibit was one of them, and I think that—I can't identify all those exhibits, but they are taken from the tonnages used in the Idaho exhibit.

Q. Well, were they taken from more than one exhibit, or from several exhibits, and added up?

A. No; they were totaled in the form that I have them, and they are identical with them. In fact, they are my basis for using any tonnages; they are the basis for using all of the tonnages that are shown, taken from those exhibits.

Q. Don't you know what exhibits those are from? You talked with those witnesses before they went on the stand and discussed the matter with them.

A. It is introduced. I can get the number, but——

Q. I don't care about the number—the witness.

A. Well, I will have to refer to it to get the witness.

Q. I see.

A. I haven't heard all the testimony and couldn't follow them in that way.

Q. I would like to know——

Comr. McManamy. Will you get that information for Mr. Spencer later?

A. Yes, sir.

Mr. Ellis. Do you recall whether——

Comr. McManamy. Or do you wish it now, Mr. Spencer?

Mr. Spencer. Well, just so I can get it before the witness——

Mr. Ellis. Do you recall whether it was Mr. Madden's or (3633) Mr. Spangler's exhibits?

2002 A. Well, I believe, since you mention it, that Mr. Spangler was the witness. Mr. Spangler's exhibit was the basis, as I recall now. I know there were several witnesses, and I didn't attempt to keep those witnesses and exhibits and numbers straight. I took the figures from the exhibit. I might say that I have included Los Angeles there, as explained in previous exhibits, that the longest mileages might reflect. It is very true that they jerked down the ton mile average, and all of that, but I consider it ultra conservative in using it that way.

Mr. Spencer. Even though the distance is shorter via Salt Lake, you want to massacre the originating line. What advantage is there to a shipper to take that business away from the Union Pacific system line and put it over the cross-State line and the Southern Pacific by a longer route?

A. Well, it is a Southern Pacific-Union Pacific joint haul via the shortest route that you could claim now, anyway. It is the same proposition. If it goes——

Q. To Los Angeles?

A. If it goes—Well, Rogerson-Wells routing——

Q. I was asking you Los Angeles. You were talking about Los Angeles.

A. True, and I consider that some of these commodities would go that way for purposes of alternate marketing. I think it has been testified to. At any rate, the only significance of the Los Angeles mileage is to include the long mileage and not allocate a greater percentage of it to San Francisco, where I believe the testimony supports that it would go. (3635.)

Q. Why, if you thought some of it was going to be routed over that cross-State line for marketing considerations, why did you give it all to that line?

A. Why didn't I?

2003 Q. And leave the Los Angeles line of the Union Pacific stripped?

A. I used this on a fifty-fifty basis, as the figures indicate, in order to be conservative as to mileage, and hence the ton-mile rate.

Q. Your fifth-fifty division is between Los Angeles and San Francisco, all going via the cross-State line, isn't it? You don't leave fifty for the Los Angeles route, do you, and the Union Pacific?

A. No; I figure the mileage via the cross-State.

Q. Just take it all?

A. Of this allocation that goes California via cross-State, yes.

The routing has been vouched for. I am not setting up the routing.

I split the tonnage fifty-fifty, it being designated that it would go across State to California markets. I am moving hay to California and dividing it fifty-fifty as between the California markets, for the sake, as I say, of taking in the longer mileage to Los Angeles.

Q. I asked you if you were moving hay 1,254 miles by this exhibit (3636) to Los Angeles?

A. I have so figured it.

There are exhibits in evidence that make such proposal; all that is in here is, as I say, taken from evidence already in. I am not arbitrarily designating—I am not designating the market; I am taking what is found—I am not designating the destination; I am taking the destination that has been given. I have heard of hay shipped from Oregon here to the Atlantic seaboard, and from Yakima there, in some instances by water. I don't know how much went by rail. We have a charge against that hay to Los Angeles of 70½ cents a hundred pounds. That would be roughly $14.10 a ton.

2004 Q. For transportation alone; and you have got a baling charge of $3.00 to $3.50 a ton, $17.60 a ton for the baling charge and the transportation. Are you representing that that is a practical movement or would move?

A. I haven't considered the feature of the cost of production and marketing, Mr. Spencer. I haven't gone into that. (3637.)

Q. You come in here as an expert presenting to this commission these exhibits purporting to show the volume of the traffic to move, the routes over which it will move, the rates to be charged for it and the revenues to accrue, don't you?

A. No, sir. I merely rate the tonnages which have been introduced and supported by the witnesses already appearing.

Q. Well, if it is absurd you, as an expert, desire to call attention to it, don't you?

A. Why, I am willing that any attention be drawn to this that you wish, so far as that matter is concerned. If they have supported these tonnages to the California markets, and I apply current rates, that is all that the exhibit purports.

All these commodities here, grain, hay, apples, potatoes, vegetables, cattle, hogs, are the products, or are of the ten southwestern counties of Idaho as assembled from the Spangler and other exhibits or estimates, indicated for movement to California markets via cross-State route. As I understand, the witnesses introducing these exhibits indicated that the products were going to markets specified, Los Angeles and San Francisco. I got that understanding from the exhibits. I haven't heard all of the witnesses.

Q. Well, those exhibits did not indicate they were going to (3638) move hay from southern Idaho counties to Los Angeles, did they?

A. I have explained that feature, I think, fully several
2005 times, and that is they indicated to California markets. I am giving you the advantage of every doubt when I take the Los Angeles markets as one of those. I could claim it 100 per cent San Francisco and raise the ton-mile accordingly. I would not hesitate to do that as a traffic expert and represent to the commission that it was a practical proposition. I am not speaking for the tonnage in its origin or destination, at all.

Q. Now, in any event, you have taken all of that tonnage and moved it over the cross-State line and the Southern Pacific hauled it down to San Francisco and to Los Angeles; is that right?

A. No. I am just taking that portion that is indicated for cross-State line movement.

Mr. ELLIS. I think you will recall, Mr. Spencer, that the Spangler exhibit does not include all of the tonnage but merely an estimate of the portion which would move via the (3639) cross-State line.

Mr. SPENCER. Oh, I know. It was presented with that same definiteness reflected by some of these other estimates.

2006 The so-called Spangler exhibit manifestly does not include all the tonnage that is originating from the southwestern Idaho counties to the cross-State line. I say it only embraces the portion indicated for the cross-State line. The exhibit may carry other data, but I have only used the portion indicated for the proposed cross-State movement. (3640.)

Q. You have in that exhibit 300 carloads of sheep moving from these originating counties to San Francisco via this cross-State line. Now, would the fact that no sheep have moved from those counties in the past years to San Francisco impress you as a traffic analyst, considering the routing of traffic, as to whether that is an absurd contention?

A. No; I would think that it runs to the very essence of the cross-State line. I think it has been testified a number of times that it is considered that it would give impetus to the industry and give the opportunity of the markets to the west coast.

Q. Notwithstanding the fact that Idaho lambs and sheep have consistently gone to the eastern markets?

A. I understand so in the past. I am not dealing with that feature of it, however. Under existing routes probably, the central California lambs the same way.

As to why I split that item fifty-fifty and gave Los Angeles 300 cars: I have no method of knowing just what the division would be and I split it that way out of fairness to you, I would say. With respect to whether there is any embarrassment now from these southern Idaho counties to move sheep to Los Angeles, as far as (3641) distance and route and service are concerned: I think it is admitted, or conceded, that it is eminently desirable that there be the diversity of routes available.

2007 Q. Now, just answer my questions, Mr. Wiggins. I asked you whether there was any obstacle to the actual movement of sheep from southwestern Idaho counties to Los Angeles now, whether it was not as good a route as via the proposed cross-State line and the Southern Pacific line for the movement of the business, a shorter line and as well operated and constructed line.

Mr. ELLIS. I don't think it is proper cross-examination.

A. I don't know as to the marketing.

Mr. ELLIS. I don't think it has anything to do with what the witness has testified to, but if he can give you any information I have no objection.

The WITNESS. As I say, I haven't taken up the marketing study. That has been——

Q. (By Mr. SPENCER.) I am not asking you about marketing at all; I am asking you whether there is a good, open, available, efficient route, main line railroad, from Boise, Idaho, to Los Angeles, California, via Salt Lake, that is shorter than the proposed route; and you can answer that question without going into a lot of side discussions about marketing.

A. I think so far as existing lines are concerned and the proposed (3642) cross-State, that the mileage is substantially the same. That is my recollection. And the Union Pacific certainly has a line from Idaho via Salt Lake and the Salt Lake line to Los Angeles.

Referring to Exhibit 76 in this case it appears that the total movement of sheep and goats from all points in southern Idaho, Mountain Home and west, in 1926, was 35 tons or three cars. As to where we are going to develop business to the extent of 300 cars, or 3,300 tons, and move them via a foreign line to that market: I haven't gone into that marketing feature of the case. That has been handled by other witnesses.

2008 I said off hand that the route, say, from Boise to Los Angeles via the Union Pacific line the entire distance is approximately the same as via Crescent Lake and the Southern Pacific. I haven't those figures before me now. As a matter of fact, I believe it is shorter via the proposed cross-State line. If I am not

mistaken, the distance breaks back there about 75 or 80 miles to the east, maybe 100. I believe I am familiar with the short-haul provisions (3644) of the interstate commerce act. With regard to my opinion about the matter of short-hauling the Union Pacific lines in putting in a through route via Crescent Lake on that movement, say, from Boise to Los Angeles: I recognize fully, I think, the axiom of railroading whereby the right to route via the line of origination exists. I might say that I believe that this traffic in the main is traffic that would not admit, however, of other than a two-line route. In other words, at most you could bring into question the possibility of it routing Rogerson-Wells to the bay cities and northern California territory, which, as I say, would be a Union Pacific-Southern Pacific haul identical almost as to the Union Pacific and Southern Pacific at Crescent.

Exam. ROGERS. Well, what I am talking about is this: I want to get your thought on the ground by which you put in a through route, say, from Boise to Los Angeles via Crescent Lake and the Southern Pacific as distinguished from the Union Pacific line, bearing in mind the provisions of paragraph 4 of section 15, which says that you can't short-haul a line in effect unless the route is unreasonably long? (3644.)

A. Well, I would feel on that question, just as an illustration, take livestock, for example, as a typical commodity seeking bay city markets and possible diversions there, that the very practical
2009 necessities of the situation would dictate that those rates be substantially the same and that they have the privilege of that movement via the cross-State.

Exam. ROGERS. I am not talking about—where are the bay cities? Are they San Francisco and cities in that vicinity?

A. San Francisco Bay and points in that vicinity.

Exam. ROGERS. I am talking about a route from Boise to Los Angeles.

A. Well, I would think that it should be practicable to allow that western Oregon traffic that outlet.

Exam. ROGERS. I am not talking about what is practicable. I want to know if you would consider the route that is 75 miles longer an unreasonable long route?

A. On those distances I would not think that that was perhaps undue circuity.

Q. (By Mr. SPENCER.) Now you say that Boise is practically equidistant; now you know, and you give consideration to available routes when you get in here and make a traffic statement to take all their tonnage away from them, don't you?

A. Well, I have figured those in every conceivable way, I think, Mr. Spencer, at one time or another.

Q. Now just look at your figures where you figure the distance (3645) from Boise to Los Angeles via Salt Lake, Union Pacific system lines, and tell us the distance.

A. No; I see I haven't that figure right before me. I have the distance via the proposed cross-State line, which is the only distance I am dealing with here.

Q. Well, it is 1,204 miles, isn't it, from Boise? If it is 1,204 miles it is 50 miles shorter than your proposed cross-State line route, isn't it?

A. Yes; to Los Angeles.

2010 If the rates, generally speaking, are the same, a difference of 50 miles probably would not make very much difference as to how the stuff would be routed. That is, what I have in mind is that there are a range of distances—of differences that are existing to-day, and I think that is probably a lesser one. As to whether I say it would not cut much figure, a distance of 50 miles: I think it is a factor; but then I don't know that it would be the only one, or the controlling one. I think the compensations that would go to the shippers (3646) handling the commodities, and other factors considered, would be determining. I could not say that the mileage factor alone would determine it.

Q. Well, all right. Now by the compensations, I assume you mean the opportunity to test the so-called bay city market that is what you have in mind?

A. Well, whatever they were; all that they might be.

Q. Well, what were they that induced this routing?

A. Well, that would be one that I would consider.

Q. Was that the principal one?

A. There might be others.

Q. What others?

A. Time might be a factor.

Q. Well, but you have got a shorter route here the other way.

A. Well, I could not undertake—I could not undertake to do or to enumerate all of the——

Q. Now Mr. Wiggins, you have taken this and routed this 50 miles longer by these outside considerations. Now Boise is 63 miles more distant, as I figure it, 63 miles more distant from San Francisco via the already open and operated Rogerson-Wells line than it will be, according to your mileage, via the proposed cross-State line. Now they have got the same considerations and advantages via the Rogerson-Wells line as they have with the Crescent Lake route, haven't they?

2011 I don't know what those are. (3647.) I think that has been covered. I have enumerated a number of things. I do not want to be understood as saying that I don't know whether there are any different considerations attaching to the Rogerson-Wells San Francisco route than there are via the Crescent Lake route. I have my own opinion as to those. I think that there are advantages to attach to the proposed cross-State route, and that the matter of marketing to the logical territories via desirable routes offering alternative markets is a very, very great one. They haven't that now to any such extent as they would have over the proposed cross-State.

They have the entire Pacific coast open to them (3648) if they have the cross-State route, and I think it is a highly desirable one for that entire territory. They do not have all of the Pacific coast markets now. They start now and it is not optional; they start in directions that are decisive. As to whether they have the Ogden route now that they won't have via the cross-State line: That is all right. You are forgetting the entire north Pacific coast, which is equally open to them if they come the cross-State. We are going to move them 130 miles longer via the cross-State line so that they can have the advantage and option of the Seattle markets, Portland markets, San Francisco, Los Angeles—the entire coast. I didn't say about the rate. As to whether we are going to give them the same rate to Portland via the cross-State line as we are via the direct route from Huntington to Portland: The rates from that territory are the same today, San Francisco and Los Angeles, generally speaking, irrespective of the differences in distance. Asking if I assume (3649) that a man has got any advantage when he arrives at Crescent Lake on a route as much longer as the cross-State line is to Portland, as
2012 compared to the Huntington route: I don't know just what difference that would make in the rate. There is some difference in the Seattle and Portland rates on those distances, but, as I say, the California markets are generally the same.

Q. You have got some eggs here, 52 carloads of them to Los Angeles, and 52 cars to San Francisco. Now of course those are not all the eggs that were shipped by carloads out of that southern Idaho territory you are discussing, are they?

A. This is only the portion allocated for proposed cross-State movement. I don't know what the total is.

Q. No. Now if it appears that during 1926 the total movement of eggs—that during 1927 the total movement of eggs from the southern Idaho counties, the whole southern Idaho country, including the eastern, central, and southwestern counties, the whole productive area, to Los Angeles, was 36 cars, and to the bay cities 16 cars, would you expect on the first year of operation of the cross-State line to move 104 cars to those (3650) destinations and split them fifty-fifty?

A. Well, there again you harken back to the agricultural tonnages and I have taken them without the marketing study on them, of course.

Q. Without marketing study—without consideration of production?

A. Well, I haven't gone into that feature. I haven't made a study of that production. I have considered the various routes.

These folks that have made the tonnage studies, I think they know, in the main, about the rates and the routes and that sort of thing. I think that they worked cooperatively with the Idaho Commission, I understand, and they have the rates.

2013 Q. (By Mr. SPENCER.) You don't assume any responsibility for routing or for production or marketing conditions, or any-

thing else; you severally go in here and confer, and each one puts in his contribution to your total summary, but you don't sponsor the correctness of this total summary, do you, at all?

A. When they allocate the tonnages from the total productions which they say will move (3651) over the cross-State, I rate those; I have rated those. Theirs is the allocation from the total production, and as to the markets and as to the route. Now then, I applied the rate in the manner that it is explained here. That is all the responsibility from that territory that I could assume. I see nothing wrong with the table myself.

As to how much revenue we have got to the cross-State line on this Exhibit 104: This is recapped at the bottom of page 3 of the exhibit. It is $158,531.21. I say and represent that at the rates indicated in the exhibit, that on a straight mileage prorate is the allocation to the cross-State sector. That is on westbound traffic only. (3652.) On the tonnages shown I consider that the ton mile rate is low. In fact, that is why I included the Los Angeles mileages, and it has pulled it down. I think that those tonnages moving to the California markets indicated would be in excess of what I have used here. We are coming in here now showing the revenue that is going to accrue to the cross-State line; to rate the tons at the current rates. As to whether or not we are representing to the commission that on the westbound business originating from those western Idaho counties, that during the first year of operation of the cross-State line there will accrue in cash revenue $158,531: As based on the exhibit, I think that is correct. I do adopt those tonnages moving as my own figures. (3653.)

Q. Tonnages and all?

2014 A. Well, I have explained how I took the tonnages.

Q. Yes. Well, you don't want to sponsor those, do you?

A. I had no opportunity to do that.

Q. No.

A. That is not my part of the business.

I will very gladly set about giving you the total revenues by years that I expect for the cross-State line, separated as between Idaho traffic, traffic originating on and destined to the cross-State line, and so-called bridge traffic to and from western Oregon. I can't state just how quickly I could do that. I have endeavored in that line to set up these different units and blocks of traffic so as to admit of what you request. It, however, is not so grouped in these exhibits, and I would request the privilege of computing it in a supplementary statement.

Q. (By Mr. SPENCER.) Vegetables, on your Exhibit 104, 1,350 tons, 90 cars to San Francisco and Los Angeles, 90 cars each, 180 cars total. Do any vegetables move there now from southern Idaho to Los Angeles and San Francisco?

A. I haven't checked that movement, Mr. Spencer. (3654.)

Q. What are you doing? Just in conference with those gentlemen reaching out into the air and building up an imaginary statement of tonnage here?

A. They conducted their studies and they made their allocations, and they took the portions via the cross-State, and they so designated them, and I have endeavored to rate them.

As to the judgment exercised in splitting this given tonnage between Los Angeles and San Francisco in the vegetables fifty-fifty: That, I thought I had explained at the outset, was done arbitrarily. I did it solely for the purpose to take into consideration the long mileage, thereby reducing the long mileage to Los Angeles,
2015 thereby reducing the ton-mile rate and for purposes of securing an ultra-conservative figure against that tonnage. I did not have any idea of suggesting that that much tonnage would go to Los Angeles, or that that was where the witnesses said it would go. (3655.)

Q. (By Mr. SPENCER.) Now, Mr. Wiggins, if all of this business as reflected by the exhibits in evidence on the actual movement goes to Los Angeles, or substantially all of it, the 50 per cent that you have allocated to the bay points as its destination with the higher rate would make a very material difference in your study and in your return, wouldn't it?

A. There again is a feature I am not undertaking to answer for, Mr. Spencer. Certainly if these tonnages don't stand, my figures of rates won't hold them.

My action in dividing this tonnage fifty-fifty between Los Angeles and San Francisco is arbitrarily made for the purposes which I have explained, wholly intentional from the beginning, and I have no apology for the division, unless I have done injury to the supporting witnesses who have specifically testified as to those markets. I did not get any suggestion from them as to whether it should go to Los Angeles, whether that was the market or whether San Francisco was. (3656.) I took it totally without any of them in sight or sound. I worked it on the fifty-fifty division arbitrarily myself.

This Exhibit 105, estimated tonnage and revenues via the cross-State line, is east and westbound all through each group there, as set out in detail in Exhibit 28. That is the large blanket exhibit carrying minute detail of compilation, and that included this same southwestern Idaho business. The Idaho westbound, which you have been discussing, is summarized under Group 6, second page.

2016 As to what westbound business is included in Group 1, for instance: That is Oregon; Oregon traffic created only.

Q. There was some 3,700 cars, wasn't there, westbound?

A. Well, it is summarized here. The Exhibit 28 shows it in minute detail. I have taken the two for the sake of making a (3657) summary. The east and west is grouped in that, but it is Oregon traffic solely. It originated or terminated in Oregon. On that east and

westbound business, Oregon business, that is, traffic created, that does not include the lumber business. Practically all western Oregon business is not diverted traffic. Exhibit 28 will show what traffic has been claimed from western Oregon.

Exam. ROGERS. Exhibit 105 shows that, too, doesn't it, at the top of the first page?

A. Diverted traffic only, Mr. Examiner.

Exam. ROGERS. On Exhibit 105, east and westbound, at the top, is that the diverted traffic?

A. No, sir. That is created traffic, as indicated just beneath the word "Group 1."

Q. (By Mr. SPENCER.) Now, you have got the estimates that make up—I want to get the east and westbound division of that. Have you got the split on that, how many east and westbound (3658) cars?

A. I haven't it right here. It is in Exhibit 28, set up by direction. Off hand I can't enumerate the commodities that are in Exhibit 28. They are set up, however, by commodity and by direction.

As to whether there is some particular reason in splitting this proposition here, picking out the Idaho counties and then the Oregon counties: Not in particular, except for the ready identification of the traffic blocks, and also the fact that the data covering the different units was received at varying times.

2017 In this Group 2, San Francisco and vicinity, to Oregon points east of Crane, as to why Oregon points east of Crane: They are points that are this side of or short of the Idaho zone eastbound. They represent, I might say, nine different points in eastern Oregon west of the Oregon-Idaho line and east of Crane. I could name a number of them. They are not confused with Exhibit 28 but are set up separately (3659) here. They are taken from the Newton exhibit. Mr. Newton's exhibit indicates nine points, I believe, east of Crane and west of the Idaho line. I have used Mr. Lounsbury on Group 5, as explained.

Q. Now, you have taken out of Newton's list 471 cars going from San Francisco to Oregon points east of Crane; is that right?

A. Yes; to the nine points that were named. I assume there were others, but, as the exhibit explained, those are the nine principal points.

I believe, if there were cars to those points, Chevrolet cars were included. As to whether that is even over the rates which are lower by Portland: I don't know whether they were Chevrolets or what they were. (3660.) Wherever I have considered the rate on automobiles I have used the rate via Portland. I am not going to route them via there, whether there is or would be any such movement or not. I had the routing on the cars and had the rate. I took the rate from the tariffs and had it corroborated by your offices here in Portland. I have no rate via the cross-State line, and I applied the manifestly lower per-ton-mile rate to that shortened routing. I know, as a matter of fact, that the Oregon-Washington Railroad &

Navigation Company operates in conjunction with the McCormick Steamship Company and has its rail and water interchange terminal, a large proportion, down here in this harbor. (3661.)

2018 With respect to whether I think that the business so destined to Ontario that will move by water and rail would be given voluntarily the same rate by the Oregon-Washington Railroad & Navigation Company in conjunction with the Southern Pacific on a cross-State line haul that is given water and rail through the Portland gateway: I just used the rail rate via the all-rail haul which the exhibit shows. These automobiles moved all rail Southern Pacific to Portland and the O.-W. R. & N. Company to destination, and the rate is on the same basis, and that is the rate that is used. I am using the all-rail rate on autos for the all-rail movement, from San Francisco to Portland and thence to Ontario, as they moved. The exhibit from which I took it, as you may recall, indicated the routing, as to whether it was rail or water, and I took the cars that were all-rail, and we observed the all-rail rate. On the cars that were by water I took fifty per cent of the number by water and rail and allocated to the proposed cross-State. There were a whole flock of rates. I had no automobiles moving all-rail and moving (3662) water and rail.

Q. Well, I am not talking about automobiles, Mr. Wiggins, now, for the moment, but I say that given commodities—take sugar, for instance, it will move all-rail and move water and rail, doesn't it?

A. Yes; I think some does.

As to whether the rate on all-rail movement would be higher than the rate water and rail to Ontario: While I didn't have the steamship tariffs and didn't check them, in the main the San Francisco to Portland rate reflects that competition, and you have that as against your combination rail and water over Portland. I assume there isn't so much, I take it, difference there. As to how the rail rates from San Francisco to Portland compare with the rail rates

2019 from San Francisco to Crescent Lake today: The Southern Pacific Company has fourth section relief both east and west of the Cascades. You lifted up, vertually, generally speaking, the fourth section relief that existed west of the Cascades when you opened the Natron line, and lifted it over to the east side. (3663.) The rate is probably higher at Crescent Lake right now than it is to Portland. I haven't checked it. I haven't checked the rate to Portland, all-rail, from San Francisco to Crescent Lake, on sugar. I don't know just what that is. Those practical considerations do not deserve recognition in the preparation of a study that I wanted to have followed in routing of traffic and movement by volume. I consider that as to that feature the circuitous mileages which I have used in the determination of ton-mile ratings largely in and of themselves compensate for those differences, bearing in mind the cross-State road. Asking if I don't think the tonnage would move on a 71-cent rate to Crescent Lake, if you could practically accomplish that rate to Ontario by rail: Well, you would have a long way

from Crescent Lake if you took the San Francisco to Portland rate which you mentioned to me. That is just one leg of the rate, and I certainly think that automobiles would move that way across there.

Q. You don't think the commission would apply the fourth section rates to Crescent Lake, or to Ontario, do you? Take its business away from—— (3664.)

A. It reflects back into all of that territory at present, and probably would, regardless of the route.

With respect to this Alkali Lake outbound and Alkali Lake inbound; I used 50 tons a day as the basis. I think Mr. Lounsbury has used the same. Mr. Lounsbury gave Alkali Lake tonnage. I took the Emerson statement of 50 tons a day.

2020 Mr. SPENCER. How do you build this up gradually? You have got a plant now that will turn out fifty tons a day of a given commodity, and you step it up by years, fifteen thousand tons to about seventeen and eighteen, gradually. Is that the way that it will develop?

A. I take it twenty-five per cent increase on the third and on the fifth, and the other is by interpolation.

Q. Where is this outbound movement to and from?

A. In that we consider San Francisco and Portland on the outbound (3665) commodity.

I applied the rate of 25 to San Francisco and 20 to Portland—$5.00 a ton to San Francisco, and $4.00 to Portland. As to what I base my $4.00 a ton rate on: I checked some rates—had them checked from Washington territory, in eastern Washington, to Seattle and Tacoma—in other words, the coast points in Washington—and took approximately the percentage relationship for the Oregon business. I have been over that Alkali Lake. There is a place there such as they had in the operations such as were explained. There isn't any railroad there from Alkali Lake to the proposed cross-State line. I assume the distance is twenty miles to the cross-State line. (3666.) I have assumed the construction of a plant and the construction of a railroad and the placing of the institution in operation so as to give to the cross-State line the first year of its operation $28,855.40. Inbound commodities were oil and ties and rails, assuming the construction of the 20 miles to reach the cross-State line, where the traffic would be delivered, and a small amount of miscellaneous. As to whether I am figuring outbound product from a plant there and crediting the revenue to this cross-State line, and at the same time crediting revenue of the rails and ties that were being used at the same time on the construction

2021 of a railroad into Alkali Lake, I considered that the plant construction, and so forth, would beat your construction, and that the commodities inbound, like rails and ties, would be certain. It is true that these rails and ties couldn't move in until the cross-State line was there. I assume that they would move by the cross-State line in. (3667.) The rails and ties couldn't move until the

cross-State line was built but the plant construction, as to the unit for the industry that Mr. Emerson explained, would reach the road, the delayed unit in construction. We are not going to put in the same volume of rails and ties each year, this is just the first year. We are going to increase the output on the plant the very second year they are in operation. I had assumed that increase explained. We divide the tonnage between San Francisco and Portland fifty-fifty. I didn't undertake to go into the eastern or other markets. It was specified it would be very general. Referring to Mr. Lounsbury's exhibit, Group V, where I took this 3,000 tons inbound tonnage (3668): That was in docket 14392. By Mr. Lounsbury's exhibit in the last case we found 3,916 tons for the cross-State line. At that time the cross-State line was connected theoretically with Bend, the Great Northern wasn't into the Klamath territory, and the cross-State line was connected with Lakeview and also with Crane. I believe the line was under construction from Crane to Burns. I don't know if it was completed. Mr. Lounsbury's increase, I believe, in his total tonnage exceeded the (3669) 12½ approximate which I have used, but I used uniformly 12½ on the four leading years. I took his figures for the first year, and made my own computation for the rest, because it isn't shown separately. I applied the 12½ per cent increase each year. That is on the original, from the first year.

Q. That, I assume, was just an arbitrary application of that increase?

A. Took the same tonnage, the same revenue, and applied 12½ per cent for the second, third, fourth, and fifth, based on the
2022 first, it not being shown in that detail here.

The first-year figure for Mr. Lounsbury's revenue for that 3,916 tons is $16,770.50. I took the same revenue as used in the exhibit. As to where there is anything in this grouping that I have got in Exhibit 105 that would reflect Lounsbury's outbound tonnage: I have the outbound indicated here. (3670.) I haven't used any other figures, because I have the tonnages supplied in every other instance. I didn't have the detail of this exhibit and didn't have time to figure it in that detail. Those tonnages, for example, in Oregon traffic created, Exhibit 28, are covered thoroughly.

Q. Now, you have got Idaho traffic westbound, Group VI. Isn't that included on your first group here, Group I? You have got east and west bound——

A. No.

That is Oregon traffic solely, that 37,643 cars. I took the westbound traffic from Exhibit 104, which was just introduced. The eastbound based on the Newton exhibits.

Q. Well, that 16,700 cars is Teutsch's exhibit over the five years, isn't it? (3671.)

A. The 6,143 conforms to the Teutsch report.

Mr. DEY. Where is 6,143?

A. At the outside on page 1, Mr. Dey.

Mr. DEY. Oh, yes. That is Teutsch, and this other is Spangler and Newton.

I made an exhibit myself in the last case on the traffic originating on and destined to that cross-State line. I adopt Lounsbury's exhibit here for sake of convenience; under the emergency of time.

As to whether it is just as convenient to adopt my own as this
2023 Lounsbury's: I haven't the detailed figures in that way.

There is no other segregated in just that way to this unit, that I know of, in my exhibit.

Q. You made it up in exactly the same form that Lounsbury did, didn't you, in the last case? You took identically the same items that he had taken in his application for a certificate of convenience and necessity to the commission for the Burns (3672) line, and multiplied the Burns extension to Crane by the additional mileage that was involved in the whole Oregon situation? Now, that is the way you figured it, didn't you, in the last case?

A. No; that was one exhibit which was compiled in some such manner but I took the basis for the exhibit, in the main, was the tonnages by the individual witnesses as they appeared. In other words, that was the handicap of the situation in that case.

Q. In any event, when you come to take the tonnage for the cross-State line you do not adopt your own but take Lounsbury's on inbound tonnage, and then adopt it here for the first time upon the inquiry of the examiner in this case, is that right?

A. I adopted this as a minimum because time wouldn't permit of feathering out that detail on a minimum amount of traffic. It was a convenience proposition solely.

Q. That tonnage of Lounsbury's was based upon a system of railroads involving some 310 or 312 miles of railroad to be constructed and operated connecting up with the towns and cities I have mentioned, to Lakeview, to Klamath Falls, Bend, and Burns, and here is 189 miles with no towns and cities touched at all, and you apply Lounsbury's exhibit as your own. (3673.)

A. Well, it is true that that exhibit in its entirety covered these different proposals and points which you mention, but the exhibit is also very specific by way of allocation to this particular sector, and that is why it found ready usage.

2024 Exam. ROGERS. Well, in that case you were figuring on common user of the Natron cut-off, were you not?

A. That was given—that was one of the considerations—I don't know—an alternative proposition; I believe that was an alternative in the case. I am not certain of that.

Mr. SPENCER. Don't you recall that? You were the traffic expert for the State in that case.

A. Well, you had a number. The common user was an alternative proposition, as I said.

Q. You made the traffic exhibits here which received such serious consideration by the commission.

A. That's all right. The tonnages were taken from the witnesses for the State. (3674.)

I don't know to what extent Mr. Lounsbury considered in his exhibit that that common user of the Natron cut-off probably would have some bearing on this figure; it might.

Exam. ROGERS. Well, what weight can we give to your figures, if we don't know about these things? That is what I am interested in.

A. If I may explain, Mr. Examiner, that this is, as I regard, practically the least item from a tonnage standpoint, or next to the least, but it is inbound of a variety of commodities that are extremely tedious to deal with, but I regard it as comparatively negligible. It was solely attributable to the emergency of time by which I used it. I am just as agreeable to working the detail in the time permitted, and I am confident that there is nobody but would concede but that there would be some tonnage in there, and I believe, too, that this represents pretty nearly a minimum. I think that is a foregone conclusion.

2025 By the least item I do not mean the least number of witnesses and number of items submitted; I mean the number of blocks of traffic that were designated in the current exhibits that were being shown here. There were a number of witnesses, as a matter of fact, and it (3675) was the minimum of all that were introduced, as far as I know. That is not particularly the reason I selected them. The controlling reason was to show something to the inbound after the orderly manner of rating from points and commodities, and avoid the loss of time which the detail of it would occasion. I selected it and adopted it as a minimum to that sector.

This exhibit 106 does not purport to show all money that would accrue to the cross-State line, $1,147,081.00, on this tonnage estimate. It just merely sets out the straight mileage prorate of the total revenue after the manner indicated. You necessarily have to refer to Exhibit 16 for the total revenues to accrue to the cross-State construction.

Q. Now, as I understand you, by this Exhibit 106 you embrace and include in it all of the western Oregon business now moving via Roseville, California, and Ogden, and you divert it to the cross-State line; is that right?

A. I have used just the Ogden routed traffic, just the portion of the western Oregon that routed via Ogden.

Q. You haven't left a car there for Alturas or for Roseville from all of western Oregon, have you?

A. I have taken—no; in this I have computed it on the total (3676) Ogden tonnage.

As to whether I think the Southern Pacific Company is going to regain any of that business to either its Alturas line or its Roseville line, I don't know how much. I think it would be reasonable that you would.

2026 As to why don't we make allowance for that when we come in here with an exhibit upon which we would expect this com-

mission to order somebody to spend $11,000,000: We have taken care in the exhibits that have gone in to make that allowance for the Alturas line, figuring it alternatively, and I have so figured in the remaining years of this, except for the correction, as I explained, in the fourth year.

Exam. ROGERS. Well, do you contemplate that the Alturas line will be in operation before the cross-State line is in operation, if ordered within reasonable dispatch, or after?

A. Well, I couldn't say as to the dates, but in considerations for accounting and computing purposes here we considered the Alturas traffic after the third year—after the third year the Alturas line in full operation, assumed that. (3677.)

I assumed that the construction of the Alturas line would be completed.

In the first year estimate here I have taken in all of the Southern Pacific western Oregon business through Ogden, whether it originates at Portland or in these northern counties. Mr. Newell considered that. Exhibit 16 on the diverted traffic will account, I believe, for corresponding cars.

Q. He takes the tonnage furnished by you, doesn't he, and states, "Furnished by Mr. Wiggins"?

A. As I stated, the other way around, in so far as this exhibit I have used the cars that are in his exhibit, but, as a matter of fact, the count via the Ogden gateway is the basis for both.

Q. I understand that you took it from him, and he took it from you?

A. Accordingly as it is used in the different exhibits; yes. (3678.)

In Exhibit 106 I have got in everything from western Oregon that the Southern Pacific hauls through the Ogden gateway, in either direction. In so-called cross-State traffic I have made
2027 up the first year on that basis, the Ogden routing. In this first year the Bend and the Klamath Falls business is included.

I was not down to the chamber of commerce here talking to those people when they were getting them into this case.

Redirect examination:

Mr. Dey asked me about attending a Portland meeting in which the chamber of commerce was involved and I answered "No". Upon thinking back over that, I do recall that I was an onlooker at one meeting in the Portland Chamber of Commerce. I wanted to correct that.

I have checked up on the exhibit numbers that I (3679) relied on in preparing my Exhibits 104, 105, and 106, so that I can make that clear in the record at this point. I have taken the copies as officially marked here in the course of the hearing, and can give you, I believe, the number and witness—the copies; I didn't carry both. In the Spangler exhibit, the Idaho exhibit by Spangler was No. 23; the Newton exhibit used in the case of Oregon tonnage, tonnage to Oregon points east of Crane, is Newton No. 8; the eastbound Idaho

tonnage estimates, Newton No. 9. I just considered them Idaho commission exhibits, and made no further detailed reference. Oregon traffic created, Group I is shown on Exhibit 105. I might state in connection with one of the Newton exhibits which accounted for 11 months, omitting the month of August, that I prorated that, to the extent of taking one-eleventh, for the full year. (3680.) I did not adopt or use Mr. Lounsbury's exhibit because I didn't have any of the records in this, or his exhibits, in this case. I have not had an opportunity to check this exhibit over to determine whether I could adopt it or not. I have seen the exhibit in the office here, or in the files, but not to check it over. The particular
2028 purpose in adopting a figure for inbound tonnage which Mr. Spencer suggests was lower than the one I used in the previous case was the emergency of time and the fact that the allocations out of the exhibits which I introduced in the other case were not specifically made to this particular segment of the proposed construction. I took it because of the readiness and availability and the emergency. (3681.)

In my judgment, I think that exhibit of Mr. Lounsbury's for inbound tonnage underestimates the traffic. I wouldn't want to do an injustice to Mr. Lounsbury, but I regard it in any adoption or usage as a minimum.

I testified to the effect that I had used on traffic from San Francisco inbound to Idaho, in applying my rate, or arriving at my rate, the existing rates via the longer haul. I used it in ascertaining the rate per ton-mile which I have applied to the proposed cross-State line. I assume that the total rate from San Francisco to Boise, for example, via the cross-State line might be the same as for the longer haul via Portland or via Ogden. It might ignore the difference. I assume the rate is maximum. I do not assume that the earning would be the same per ton-mile, or that it would be the same for the entire haul. I think that the allocation on the ton-mile rate used is less than—that it is a minimum, conservative.

Q. Well, then, if I understand you correctly, you use it merely for obtaining the earnings per ton-mile, and not as suggesting (3682) that the through rate between the points would be the same via both routes?

A. I manifestly have no way of determining that, and used the per ton-mile on the only basis ascertainable.

2029 By actual count I checked the automobile shipments from San Francisco to the interior, southwestern Idaho and eastern Oregon and what extent they were moved by water and by rail. My check showed, almost wholly, from the records, by rail, all-rail, Southern Pacific to Portland and O. W. R. & N. to the interior. As to what factor governs that movement by rail as against water:

In that particular kind of traffic it is my opinion that the factor of time would be a very important consideration, and there are probably other compensations that go with it, but I would think the

time and the desirability and the manner and character of carriage that the rail offers would almost be controlling.

Mr. ELLIS. Oh, just one more question please. On Exhibit 106, where you refer to Exhibit 16 for the revenues claimed to the cross-State line, in referring to Exhibit 16 in that manner (3683) did you have in mind the Exhibit 16 as already introduced, or as it is to be supplemented by Mr. Newell's further testimony?

A. As supplemented. He has, I believe, certain supplemental data in connection with that exhibit.

Recross-examination:

Q. (By Mr. SPENCER.) There was one question, if I might, that Mr. Ellis asked you about, Mr. Wiggins, as to the rates through Portland, and reviewed your application of them through Crescent Lake, and you, as I understand it, had divided on the mileage prorate between the cross-State line and the Southern Pacific on the Crescent Lake movement?

A. I just made it straight mileage prorate to the cross-State.

Q. Which means mileage prorate to the Southern Pacific?

A. Well, it would mean the allocation of a different unit controlling the 189 miles, if I understand you.

2030 Q. Every sector, as you call it, or unit, in the route would receive a mileage prorate if the cross-State line received a mileage prorate, wouldn't it? (3684.)

A. I don't know what your divisions would be. Manifestly the cross-State—the mileage prorate allocation to the cross-State isn't what the cross-State traffic would be entitled to or would inherit I take it, but it is probably the best practical method that I knew of by dealing with it conservatively. It is the method I have used. I think, just as in Exhibit 106, in the allocations that the cross-State is entitled to a great deal more than is shown in there.

Q. The rate by rail to Southern Idaho from San Francisco via Portland is a combination of locals, isn't it?

A. I believe, taking, for example, a rate like San Francisco to Boise, I think that is 72 cents plus $1.82, which would make the combination rate of approximately $2.54, I think.

Q. Combination of locals?

A. Yes, sir.

Q. Did you make the combination of locals via Crescent Lake?

A. Well, I don't know how that would be. I haven't concerned myself with the matter of the joint-rate basis, those ordinarily being inaugurated by the carriers.

Q. Now, one would be a long, circuitous route, and the other a short one, if they were moving rail? (3685.)

A. The Portland routing as against the Crescent Lake, you said?

Q. Yes.

A. The cross-State would shorten up the movement, and incidentally the time, a great deal; yes.

2031 Q. What would you consider an unreasonably circuitous route, where that distance is involved, nine hundred to eleven hundred miles? How much margin do you allow there before you would throw one line into an unreasonably circuitous and impossible route?

A. Well, I don't know that I figured that. I think probably the Interstate Commerce Commission decisions as a whole offer some guidance on that. I don't just recall what it would be styled. I presume circumstances and conditions alter cases. I presume it would be a matter of individual cases, individual situations, individual conditions, or particular conditions. As to my opinion upon that as an expert: Offhand I don't know. Ordinarily, as I say, it would (3686) be as revealed by the commission where mileages in excess of five hundred miles are reached. I don't just recollect on that. Mileages shorter would probably reflect more closely the differences.

Q. I asked you the hypothetical question here. This is nine hundred to, say, eleven hundred miles involved—I don't know just what the difference is around via Portland and Crescent Lake. Do you have any opinion on that?

A. No; by way of—not exactly, but by way of specific example, we were speaking of automobiles there—I would consider that the shortening of the distance from California, from San Francisco, for example, to the Idaho territory, even, as where those automobiles go, would be of sufficient importance as to virtually control that movement in there. In fact, I have so considered that it would claim the traffic to the rails that way.

Q. Well, you have diverted all the western Oregon business to this cross-State line, and all of southwestern Oregon business, practically. I am wondering whether in all commodities you have got any yardstick whereby you would classify the circuitous route
2032 as unreasonably circuitous and excessive, so as to bar them from participating in the traffic here, how much different percentage relation there should be, but if you haven't any judgment on it I won't press the question.

A. No; I think it is a matter that a hard and fast rule (3687) couldn't be applied to all the cases alike. I think it is a matter that comes back to the particular situation and particular conditions.

(Witness excused.)

F. L. Burckhalter was thereupon recalled as a witness, and, having been previously duly sworn, testified as follows:

Direct examination:

I prepared a memorandum that I suggest might be copied in the record that gives the information asked for. It is just a statement of figures.

(Said memorandum was copied into the record, as follows:)

Interchange balance—Refrigerator cars, El Paso & Tucumcari—Year, 1926

Loaded refrigerator cars received from connections—El Paso	6,160	
Empty refrigerator cars received from connections—El Paso	17,723	
Total refrigerator cars received from connections—El Paso	23,883	
Loaded refrigerator cars delivered to connections—El Paso	27,441	
Empty refrigerator cars delivered to connections—El Paso	763	
Total refrigerator cars delivered to connections—El Paso	28,204	
Excess refrigerator cars delivered to connections—El Paso	4,321	
2033 Loaded refrigerator cars received from connection—Tucumcari	3,929	
Empty refrigerator cars received from connection—Tucumcari	46,073	
Total refrigerator cars received from connection—Tucumcari	50,002	(3689)
Loaded refrigerator cars delivered to connection—Tucumcari	41,766	
Empty refrigerator cars delivered to connection—Tucumcari	1,395	
Total refrigerator cars delivered to connection—Tucumcari	43,161	
Excess refrigerator cars received from connection—Tucumcari	6,841	
Interchange between the two gateways shows net excess refrigerator cars received from connections	2,520	

Southern Pacific Co. (Pacific lines)—August 22, 1928.

(Witness excused.)

J. P. NEWELL was thereupon recalled as a witness and, having previously been duly sworn, testified as follows:

I have prepared a supplement to my Exhibit 16. This supplemental exhibit contains calculations that the cost of moving that additional traffic which has been testified to by Mr. Wiggins and is contained in his exhibits, and the estimates of the resulting earnings from it, and also revisions of the tables of net earnings and return which are given in Exhibit 16. (3690.) I referred to Exhibits 104, 105, and 106 that Mr. Wiggins explained this morning. With respect to this supplemental exhibit, I think it is so fully written down here that very little explanation is needed. It contains no traffic which has not been testified to and presented in other exhibits.

2034 The cost per car which is applied to these various hauls has been taken from Exhibit 16, either exactly or by allocations which are very close to other figures already calculated and shown. Those costs per mile or per car are stated in the exhibit, together with the number of cars to which they are applicable, and the resulting cost. That cost is then compared with Mr. Wiggins' exhibits as to gross earnings, and then presented as to net earnings. This supplemental exhibit does not cover or duplicate any information contained in my Exhibit 16. As to whether it treats only of the potential earnings of the cross-State line from such additional items of traffic as Mr. Wiggins covered in his Exhibits 104, 105, and 106: It contains nothing else. (3691.)

Table XX of Exhibit 16, as found on page 139, is revised on page seven of this exhibit by the inclusion of these additional earnings. That table contains earnings calculated for that line on the assumption that the Alturas line would be built later and that the division of rates would be on a more favorable term to the cross-State line during those first three years than it would later. Then I also take Table XXII of Exhibit 16, page 142, and on page eight of this exhibit, I show what that would be if revised by the inclusion of these additional earnings, together with the rate of return which would then be produced. (3692.)

This supplemental exhibit sufficiently indicates in itself the sources of the additional tonnage on which I have computed cost and net earnings.

(The statement so offered and received, entitled "Supplement to Exhibit 16, Additional potential earnings of cross-State line," was thereupon marked "Complainant's Exhibit No. 107, Witness Newell.")

2035 I have concluded from the information contained in my Exhibit 16, and this supplemental exhibit, that the cross-State line and its construction could be justified with any traffic less than 100 per cent of the traffic to and from western Oregon moving west or east through Ogden, Utah. (3693.) That is fully dealt with in the exhibit.

It is true that my Exhibit 16 is predicated on the thought that the division between the Southern Pacific and the Union Pacific, if this line were built by the Union Pacific, could be so fixed that by diverting the traffic at Crescent Lake the Southern Pacific would make more money than it now makes on the same traffic, and the Union Pacific would also make expenses and some margin. You see, now, I assume you mean by the Roseville route. By the Alturas route, my contention was that it might be permitted to make the same earning. In making that statement I was basing my comparisons on the present divisions and present revenues of the Southern Pacific and the Union Pacific. I have not given particular thought to what our cost study (3694) showed as to the propriety of the present divisions between the Union Pacific and the Southern Pacific on the traffic handled as it is now handled. It has appeared to me that there was in there evidently an allowance to the Southern Pacific for the origination of the traffic. If it were based strictly upon a cost basis, that the allocation to the Southern Pacific of that traffic would not be quite so large as it is now, but the difference is not great and seemed to me would be fully accounted for by the right of the originating line to have some allowance for origination. As to whether I have made computations to show how the divisions stand, handling the traffic as it is now handled through Roseville: I have not made a computation especially for the

2036 purpose of showing that the saving to both carriers could be greater, because it seemed to me so perfectly obvious that if it could (3695) be done through Alturas it could also be done

through Roseville, that no calculation would be necessary. I think on the pure basis of cost the division between the Southern Pacific and the Union Pacific on traffic handled through Roseville is as it should be. I think it is a reasonable division. At least, I find no reason to think otherwise. I don't profess to be expert on that point, but as regards cost, it seems to me to be a fair division, considering the cost to both carriers of that present haul. It is true in some cases that my cost computations showed that the Union Pacific was now handling some of this traffic at practically a loss.

Exam. ROGERS. If that be true, how can the divisions be proper?

A. Well, it is only because that same division is applied to the entire lumber traffic. Now, when it comes to those light loads in which, as from Klamath Falls, for example, the Southern Pacific has a considerably shorter haul, if it were applied to that alone I would say the division was not a fair one; but upon those lighter loads neither carrier makes anything like a compensatory earning, and it is true, as regards (3696) that, I don't think the Union Pacific gets enough. But I took it for granted that the rates must necessarily, and divisions, be the same for the two kinds of lumber. I was speaking of it in consideration of all the lumber traffic handled in that way.

It is of course true, taking the Union Pacific, if they are losing money now I might determine from my study that they would afterward make more money than they do now. That would not mean much. But, as regards that, I should have to anticipate somewhat some things I expect to be called on to state later, in regard to what Mr. Burckhalter has said in regard to this empty car movement. As he describes that empty car movement, it would
2037 tend relatively to improve the Union Pacific's situation in that present division. How much I am unable to say until I can figure it out in some degree, but, as he describes that, with the Southern (3697) under the necessity of furnishing all those empty cars and the Union Pacific with no requirement for hauling empty cars back, it would have its situation relatively improved in that division. I would be inclined to question, under that condition, whether the Southern Pacific was getting a fair share of the division. That would be the only question I would raise. Supposing it is true that the Southern Pacific is not getting a fair shake out of the divisions now, my computation is based on the theory after this method went in they would make more money than they do now. My computations are based upon what they would earn by the Alturas route, on the assumption that the division of rates would remain the same, and that the Southern would take to itself the additional saving of its shortened haul.

Cross-examination:

Right in that connection it costs the Union Pacific precisely just as much money to move this traffic if it received it at Ogden from a routing that went (3698) via Alturas as it does now.

Q. And if it is losing money on that traffic now, would you contemplate that the division should be arranged via the Alturas route so it would receive a larger division, the Union Pacific?

A. I haven't gone into that at all. I haven't said that it was losing money, except on some portions of that traffic. And that a minor portion. If it is a practicable thing to make a different division on pine lumber from other lumber, why, I would say that it ought to be done in this case. It would be perfectly fair from a cost standpoint.

2038 Q. Now, your answer with respect to the divisions, that is, that they were perhaps not right and fair under the existing operations through the Roseville gateway, does that apply with respect to the Portland gateway?

A. Well, I was not asked that question. You refer now to this 25–75 division?

Q. Yes.

A. I would say from a cost standpoint that is not a fair division. (3699.)

The Union Pacific gets the worst end of it there; so much the worst that I can't see any object in their attempting to get that traffic under that condition. We give them a better division than that on our proposed cross-State line operation. We show these substantial savings in our computations via the cross-State line from the movement of the existing business from western Oregon. The Southern Pacific can take the western Oregon business on the water grade from Eugene to Portland with less expense than they could to Crescent Lake from Eugene. There wouldn't be just as much of a saving to the Southern Pacific, and just as much profit to them, to turn that business over to the Union Pacific at Portland, as at Crescent Lake. If there was as much profit to the Southern Pacific, then there would not be as much left for the Union Pacific. It costs the Southern Pacific less money to take it to Portland than it does to Crescent Lake. (3700.) On the Crescent Lake operation, or Eugene via Crescent Lake to Omaha, we give them a certain division which is more profitable to them than if it is routed via Roseville. The Southern Pacific could make a more profitable division for both carriers by routing the business through Portland than they make by routing it through Roseville. But the cost of haul direct from Portland to Omaha by the Union Pacific is not such as to permit that division.

2039 Q. That is, it is not such as to permit of the Crescent Lake division?

A. Except as it comes right at Portland. There is some of that at Portland which, it is true, could more economically to both carriers be sent through Portland.

Q. That is now routed through Roseville?

A. Yes.

Q. Is that true as to business in Washington County and Tillamook County?

A. Whatever is to move through Portland. (3701.) I mean, of course, within the suburbs that are practically within Portland; I don't mean merely within the city limits. By Portland I mean the Willsburg junction and Brooklyn yards; any of those junctions here by which it would move.

Q. And with respect to all that traffic, the Columbia River gateway is admittedly the best route of all of them, wouldn't it be?

A. Yes; for some of that. Yes; for that traffic that would be true. Under my proposal here I would take that traffic the cross-State line. That is the way it has been figured here, because it is moving now through Roseville.

The division I give via Crescent Lake is stated on page 117 as applied after the Alturas line is in operation, 27 per cent to the Southern Pacific, from Eugene. (3702.) That is to be delievered to the O.-W. R. & N. at Crescent Lake. On page 113 I say 17 per cent. That is on the assumption that a different rate division will be made until the Alturas line is in operation.

Exam. ROGERS. Have you given a less division by Roseville than you do via Alturas to the Southern Pacific?

A. I haven't proposed anything at all via the Alturas line in this.

Exam. ROGERS. I thought you said 27 per cent after the Alturas line is in operation?

2040 The WITNESS. I have prepared here two sets of conditions, one on the supposition that the cross-State line will be built first and that for a period of three years it should be allotted a higher division, a division as compared with Roseville conditions; then that if that time, or later, the Southern Pacific built the Alturas line, that it should then be considered as the route for the Southern Pacific to haul, and it should be protected in the earnings that it might make (3703) on the same traffic through Alturas. That would call for a different set of divisions, and that is the reason for the 17 per cent in the one case and the 27 per cent in the other. It is true the Union Pacific would do the same thing in both cases. It is my recollection of the figures that it costs more to haul a car from Eugene to Crescent Lake than to Portland. I think that is correct. I think I can find the figures for you. In my Exhibit 36 I gave the cost for haul from Eugene to Portland by the Southern Pacific as $33.28. On page 75 of Exhibit 16 I give the cost from Eugene to Crescent Lake as $48.54. By the haul to Portland the Southern Pacific would save about $15.16. On page 117 I give the Southern Pacific 27 per cent with the interchange at Crescent Lake. With a freight charge that is $437.50. Now that is 2 per cent more than they get now for the Portland interchange (3704), they get 25 per cent, that is correct. In other words, it costs them $15.16 more to haul it to Crescent Lake; they could now even afford to haul it to Portland for the 25 per cent and still save $6.00 or $7.00 on the

operation for each car. They could when you get it up to 27 per cent. If that division remained, that is true.

2041 Q. Well, if economy in operation, the saving of expenses, is the important consideration here, why is there no study made on the existing route via Portland, and why is all this business, Linn County and north, diverted to the cross-State line?

A. Because it moves past that now. It moves past that point of junction under present conditions.

If the Crescent Lake line is made more attractive by division of rates that protect the Southern Pacific so it earns as much on a short haul as it would on a long one, I think it would be much more desirable than the Portland junction. I say now you are allowing the Southern Pacific too much money to Portland, and you are not allowing the Union enough to make it an object to get it.

I didn't hear Mr. Lounsbury's testimony, where he (3705) is chasing these men around personally in the Willamette Valley in an endeavor to get a car here and there. I can't see why he should want it. Certainly we are trying to find some way to support the cross-State line. The cross-State line is not the better route to move some of the traffic than the Portland route; that is true. But it is actually moving the other way. I have made the assumption that the Southern would hold onto it, at least that far, and there was no particular reason in economics to call for it otherwise. It is true some of it could be sent the other way to advantage.

Exam. ROGERS. Let's take the Southern Pacific's standpoint alone; is there any better reason, from their viewpoint, from their pocketbook, in turning it over at Crescent Lake than in turning it over at Portland?

A. For the greater part of the traffic there is, because that is the economic route. Take it from Eugene as a center, its economic route is to send it across the Crane line and not through Portland, but for some of this right close to Portland that is not true. (3706.)

I said that it cost $33.38 to move that car to Portland from Eugene, whereas it cost the Southern Pacific $48.54 to move it up to Crescent Lake. All of this western Oregon business is eastbound,

2042 that I am discussing here through these gateways. (3707.) It is correct that it costs $33.38 to move the business to Portland from Eugene, that it costs $48.54 to move it from Eugene to Crescent Lake.

Q. Now how can it be, then, that for the bulk of the traffic in western Oregon, as far as that part of the movement is concerned, how can it be more economical for the Southern Pacific to deliver it to the Union Pacific at Crescent Lake than at Portland?

A. I haven't said that that was more economical as regards that particular haul. Of course it costs them less to haul it to Portland. That is not the whole question by any means. When it is up at Crescent Lake it costs the Union Pacific considerably less to haul it the remaining distance than it does if it is at Portland.

Q. Now what reason obtains for a division of 27 per cent to the Southern Pacific after the Alturas line is built as compared with 17 per cent under existing conditions, where it moves through Roseville? (3708.)

A. Because by that saving there, which is accomplished by the cross-State line as compared to the Roseville line, would be due to the Union Pacific's investment. Under the division as I have worked it out there you will find—I can't at the moment refer you to the page, but you will find it shown that the Southern Pacific on that same traffic would have a substantial increase in its earnings over what it would get if it hauled it through Roseville, and that without expending any money whatever. That seems to me is a very liberal arrangement for the Southern Pacific, that it might profit through the building of the cross-State line without having spent any money on it.

I think the Alturas line ought to be built, and I think the Southern Pacific should be encouraged to build it by the promise
2043 of a better division when it is built. Or, if it built first, I think it will be necessary to recognize it, of course.

The question on what authority, or what basis or assumption I assume that any order can be made diverting any of this business to the cross-State line, assuming that the Alturas line is built, is a legal question. I have been informed by the attorneys here present, that it can be done. I have no opinion on the subject. (3709.) As far as I see it, if it can't be done, why, this whole study or discussion won't fit the situation.

And under existing conditions if the Portland route is used substantial economies could be effected, and each railroad interested could make increased profit from existing operation. I take it for granted that since this situation has existed for a long time, there must be some other reasons which have prevented that being done, and presumably those conditions would continue to exist. I don't know what they are.

Q. Now for what commodities would you consider the existing lines and routes unreasonable as compared with the proposed cross-State line? And by existing routes, I am assuming that the Alturas line is a constructed route, is being constructed. When I say the "existing routes," I am assuming the Alturas line in connection with the Central Pacific and Ogden, and the Columbia route of the Oregon-Washington Railroad & Navigation Company. Now for what commodities in western Oregon do you consider those routes unreasonable?

A. I haven't said they were unreasonable for any commodity.

Q. In distance or circuity, as compared with the cross-State line?

A. I haven't expressed an opinion on that. I have simply shown what the cross-State line would save in the handling of (3710) certain commodities.

2044 Q. Well, do you consider them circuitous?

A. I don't know how that is to be defined as it is used in rate matters. Certainly those routes are longer. That is all I know.

Exam. ROGERS. The term is "unreasonably longer," isn't it?

Mr. SPENCER. Yes.

Q. Are either of them unreasonably long in your observation and experience? You have been working on railroads, and as a railroad expert from Canada to Mexico you can say whether the Alturas line, in connection with the Southern Pacific and the Union Pacific via Ogden, is an unreasonably circuitous route as compared with the cross-State line proposed?

A. Well, I can only think of that in the terms that I am accustomed to. I don't think it would be unduly circuitous, unreasonably circuitous, so long as the saving to be effected by the construction of a shorter line would not support that line; but I think it would be unreasonably circuitous whenever the conditions would reach the point that a saving could be made on the same traffic that would justify the construction of another line. I don't understand that is the kind of a definition you have in mind when you use the term in making rates.

Q. No. Well, when you proceed to dismember the traffic structure of a railroad, your cost computations on the new line to (3711) which you divert it can't follow? That is, you won't have the same operating success on a new line, particularly one that does not start from the owner's terminal, as you would under an old operated railroad that is a going concern, like the Union Pacific system, would you?

A. Well, of course there would be some difficulties connected with a new line. But this new line, with the traffic ready-made for it, would escape most of those difficulties.

2045 I am not proposing to dismember any traffic structure; I am proposing a division there under which both carriers would be better off. That is not dismemberment.

Q. Now I want to ask you in that connection whether the O.-W. R. & N. is not pretty effectively dismembered if it is stripped of the southern Idaho traffic that is available for it westbound?

A. I don't understand we have stripped it of any—contemplate stripping it of any of any consequence whatever. It might be a small amount would be diverted in that direction. I think it would.

In Exhibit 107 I take practically all of that business that is contiguous right now to the branch and main lines of the Oregon Short Line (3712) in southwestern Idaho that I am figuring these earnings on. To whatever extent it may go west, it is true it is now enjoyed by the Oregon-Washington Railroad & Navigation Company. My understanding of the testimony of the Idaho witnesses was that this would all go to California. I don't understand from them that it is now going over the O.-W. R. & N. I can't answer as to that. I am not positive. But that was not my understanding. Assuming that it is going over the O.-W. R. & N. and a traffic analysis of the southern Idaho business shows that it goes to Oregon and Washington

points, and it is then diverted to San Francisco, the O.-W. R. & N. would suffer for the traffic westbound—to whatever extent that is true, of course, it would be taken away from the O.-W. R. & N.

Q. Now the O.-W. R. & N. needs traffic, doesn't it?

A. All railroads need it.

Q. Well, I know, but from a comparative standpoint, you know (3713) that the O.-W. R. & N., for a number of years, has been unable to earn its fixed charges, notwithstanding large and generous divisions accorded to it by the other system lines?

2046 A. I do not know about that.

Q. You have analyzed these statements here for years, haven't you?

A. Yes; but I don't know whether they give that division of traffic as the way you speak of it. I don't understand they do—I mean divisions of revenues.

Q. Well, assuming that they do and that the divisions are abnormally large and prejudicial, maybe, to the Short Line and the Union Pacific, but in any event, with their generous, full divisions the O.-W. R. & N. is not making any money, is it?

A. Well, I don't understand that is the fact. The only knowledge I have of it is in the reports made to the public service commission of this State. My understanding of those reports is that the revenues there attributed to these lines is on a straight mileage basis, without any regard to the generous divisions you speak of. I know nothing of those latter.

Q. I wish you would look at this chart, Exhibit 89, reflecting the divisions received by the O.-W. R. & N. from the other system units, revenue divides between the Oregon Short Line on any traffic originating or received on the O.-W. R. & N., 53 per cent, whereas the mileage divide is 47 per cent.

A. Isn't that 44? (3714.)

Q. No; wait a minute; 44. That is right. That is Salt Lake. And the other division with the Short Line, Union Pacific, and the O.-W. R. & N. divides 35 to the O.-W. R. & N.; 27 per cent to the Short Line, and 38 per cent to the Union Pacific. Does that appear to you that the O.-W. R. & N. is getting pretty large divisions there?

A. Why, offhand I should say those look like reasonable divisions. But are the revenues reported to the public service commission of this State based upon such divisions?

Q. They certainly are.
